The Nation.

NEW YORK, THURSDAY, JULY 5, 1906.

The Week.

By Executive order, Secretary Root has now succeeded in obtaining nearly the full measure of consular reform which he asked of Congress. Hereafter, under the comprehensive rules issued by President Roosevelt, all promotions within the service are to be made only for demonstrated efficiency, while all original appointments to the lower grades are to be in accordance with the merit system. Vacancies in these grades are to be filled, first, by the appointment of consular clerks, agents, and deputies, who have themselves entered the service after examination; and, second, by the nomination of other candidates who shall have met the prescribed tests in knowledge of languages and commercial law. It is especially provided that in no case "will the political affiliations of a candidate be considered." The only limitation on the pure merit system is that appointments shall be made so as to secure "proportional representation" among the various States. All in all, this is a notable reform which Mr. Root has compassed by steady persistence, seconded as he has been by Mr. Roosevelt. The Secretary must have taken secret pleasure, in view of the refusal of Congress to do what has now been accomplished by the President's order, in penning the following sentence, of which the irony is delicate:

Judging from the positive commendation which many members of both Houses have expressed for the proposed change in the method of appointing consuls, I do not doubt that the new system will receive the hearty approval of the Senate and of Congress whenever occasion may arise for an expression upon the subject.

"Fearless and patriotic" is one of the phrases which President Eliot used in conferring upon Secretary Ethan Allen Hitchcock the Harvard doctorate of laws. The characterization is apt. An honorary degree for public service could not be more worthily bestowed. It is unnecessary to detail Mr. Hitchcock's victories, which are still fresh in all memories. Enough to say that he found the administration of certain land offices honeycombed with fraud—fraud involving not only men of wealth and of prominence in local politics, but high officers, Representatives in Congress, and even one member of the United States Senate. Unmoved by clamor, appeal, or powerful political influences, unterrified by threats, he has pursued, and is still pursuing, these malefactors to the bitter end. In his speech at the commencement

dinner, Mr. Hitchcock declared that the successful prosecution of these cases would have been impossible without "the inspiration, example, and support at all times and under all circumstances" of President Roosevelt. This, as men familiar with conditions in the Northwest are well aware, is not a mere perfunctory acknowledgment. The bringing of the land-thieves to justice must rank as one of the finest achievements of the Roosevelt Administration. But if Secretary Hitchcock was fortunate in having the hearty backing of the President, the President was equally fortunate in having a Secretary of the Interior who deserved such backing.

The railway catastrophe at Salisbury, by which twenty-three Americans lost their lives, will set many a newspaper reader to wondering if in the matter of accidents English railways are, after all, so superior to American. When the killing of 10,046 persons and the injuring of 84,155 others was reported by the Interstate Commerce Commission as the terrible record for the United States in the year ending June 30, 1904, there was a justifiable outcry against a waste of human life, beside which the losses in many great battles appear insignificant. That there should be systematic effort to check the slaughter is obvious; this feeling has already led President Roosevelt to invoke the law against such railroads as have violated statutes in regard to safety appliances. Nevertheless, comparisons with foreign statistics are often misleading. Of the thousands of victims in 1903-04, only 262 were killed and 4,978 injured by collisions and derailments in the United States. The majority are those who insisted on walking the tracks, stealing rides, and jumping from moving trains, or are employees sacrificed by incompetent officials or by the carelessness of the management. In England, in 1904, 1,158 persons were killed, although the railway mileage in the United Kingdom is but one-tenth of that in the United States. When the English injured for the same period, 18,802, is compared with the 84,155 injured in the United States, it is apparent that the number of killed and injured in Great Britain was greater per mile in that year than in the United States. It is in the number of employees and trespassers killed and hurt that our own railroads may be rightly indicted as far more reckless than the English.

The "Sixth and Final Report" of the two remaining members of the investigating committee of the Mutual Life, William H. Truesdale and John W.

Auchincloss, brings forth new instances of mismanagement and dishonesty. Speaking of the real estate department the committee declares:

In the administration of this branch of the company's operations great extravagance is glaringly apparent on every hand, coupled with entire absence of ordinary business methods and care.

One specification is that the entire real estate investment holdings of the company showed a net loss on cost price of \$5,723,633 on December 1, 1905, and earned approximately 2.444 per cent. on the capital invested in 1904 and 2.495 in 1905. Moreover, there is a discrepancy between the general books of the company and those of the bond and mortgage department, whereby three "temporary" loans were made, aggregating \$410,000, of which the law department has no knowledge and no record of title. Of this whole sum \$300,000 is still unaccounted for. The committee discusses several other transactions of questionable character. As significant as anything in the report is the clear admission that the trustees should not be interested in subsidiary companies or in syndicate operations with the Mutual. A year ago such practices seemed to be almost the rule in life insurance management. The agitation of the subject—to say nothing of the legislation at Albany—has brought to all minds a clearer understanding of the fact that no trustee should be placed where his decision regarding the company's investments will affect his own pocket.

The poor "widow woman" who sewed on trousers for the army and who, threatened with the loss of employment by the heartless contractors at the Schuylkill Arsenal, appealed to the President to save her job, need not fear that her work will be taken over by imported needlemen from London. A patriotic Acting Secretary of War assures us that the British expert on army uniform is only to modify or "smarten" the pattern after which the clothes of our soldiers are cut. Mr. Winter expressed the object of his mission cleverly when he declared: "I am going to make your privates look like officers, and your officers—all like generals." The khaki uniform, leggings, and slouch hat are useful and picturesque; on hard duty our privates yield nothing to Tommy Atkins in the matter of dress. But the "army blue," as it is cut and fitted to the average American recruit, is not calculated to rouse a soldier's pride in his clothes. Only the French and Italian infantry soldier is as dowdy and unimpressive a figure as that shown on the lithographs pasted above the doors of recruiting stations in this country.

If all of our great sartorial designers insist upon taking up illustration and portrait painting, we must bring over from London an artist humble enough to work on an army uniform.

The news that the Hamburg-American Company is to build the first 800-foot steamship is a fresh reminder that the rivalry of Atlantic steamship companies is international. This venture is avowedly to put on the New York route a ship superior to the 760-foot *Lusitania* and *Mauritania* of the Cunard Line. These leviathans were intended to win back for England that supremacy on the Atlantic which the German companies have held for several years. And if, as some would have us believe, every French heart is throbbing ecstatically in unison with *La Provence's* mighty engines, we may soon hear of an 850-foot Frenchman. Canal and dock builders must take notice. The day of the 1,000-foot liner is not far off. The *Great Eastern*, with her 690 feet of length, is forgotten. For the last decade or more there has been a falling off in the desire for very fast vessels. In the eighties, when the *Alaska*, the *Arizona*, and the *Oregon* were making their records, speed was the great desideratum. From 1895 to 1900 more attention was paid to other features. All the companies—particularly the German ones—have found much profit in catering to the many people of small means who want comfortable steamers, but are ready to spend from eight to ten days on the water. The English builders have responded to this demand by constructing such ocean giants as the *Baltic*, the *Cedric*, and the *Celtic*, whose stewards vaingloriously boast of never having had to produce table racks.

The Cunard Company has shown foresight in turning—like the British navy—to turbines. The Germans still hesitate to adopt them, just as they have been over-conservative in taking up the submarine; but the turbine ship is such a vast improvement in steadiness, in the comparative absence of vibration, the lack of unpleasant odors, and in the saving in engine-room force, that its eventual capture of the whole ocean can hardly be doubted. That turbine engines are still in the experimental stage and have not made the saving in coal hoped for, is true. Even the *Lusitania's* turbines and the arrangement of her four great screws have not escaped the censure of engineers. Her reversing engine-power, however, will be tremendous, and she will disprove the early argument that turbine boats cannot back. What further revolutions the liner will undergo no one may dream; but this is certain: the turbine has come to stay until superseded by some still more remarkable invention.

"If I go into a saloon for a glass of beer," declared a loyal union cigar-maker, at a meeting of the Central Federated Union in New York last Sunday, "and I see non-union bolognas, I walk right out." He might be excused, in these troubled days, for walking right out if he merely saw bolognas on the free-lunch counter. But there is implied in his words a fine enthusiasm for union principles—let the mottled segments but show the mystic label, and this man would not only drink his union-made beer, but would eat his sawdust, candle-ends, and tow, disguised as bologna, and be virtuously refreshed thereby. Bit by bit, the horrible treachery of the average working man is being exposed. He buys boycotted beer merely because he likes it; he smokes non-union cigars, and is not choked by the fumes; his wife is allowed to patronize non-union bakeries; his children go to school to be taught by unorganized "scab" teachers; and, worst of all, when he arrives at the dignity of an office in the Central Federated Union, he neglects to find out whether the horse he rides in the Labor Day parade has been shod by a union horseshoer. These are all preventable blunders. Let no guilty union man say that he forgot or that he didn't know, or that his wife didn't ask him. It is only by the rigid observance of such minor points of doctrine that the majesty of the whole union theory is borne in upon the toiler.

The National Sculpture Society is investigating the rather unusual controversy between Charles Henry Niehaus, the sculptor, and the Louisiana Purchase Exposition Company. Mr. Niehaus had made, as was supposed for temporary purposes connected with the exposition, a statue of St. Louis. Learning that it was to be put in bronze and permanently installed in Forest Park, he protested, and demanded opportunity for revision and improvement of the statue, with extra compensation. The dispute has little artistic consequence; it is easier to comprehend the sculptor's desire to suppress the statue than the committee's zeal to perpetuate it. But the case raises an interesting issue of principle. Much avowedly ephemeral work for temporary decoration is done by all artists. Certainly it is desirable that they should retain control over such production. They should, it seems, be protected by a specific form of contract, such as an author enters into when he sells merely the magazine rights of an article, and reserves rights of permanent publication. The case seems to call, not for new legislation, but for more businesslike dealings between artists and arrangers of exhibition pageantry.

Educational authorities who smile

pitiably when a self-made critic denounces "fads" in the schools, may now quote the result of a recent inquiry among Providence parents. A blank was sent to 5,500 parents and guardians of children in public schools, asking for an answer to this question: "Shall the so-called 'fad' studies be taught, or shall the whole effort of education be confined to the teaching of 'the three R's' alone?" Some 4,900 replies were received, 87.9 per cent. of them favorable to the "fads." In special divisions of the questions, the answers were distributed as follows:

	Favorable.	Not favorable.
Music	4,726	173
Drawing	4,663	222
Gymnastics	4,651	231
Nature study	3,844	1,004
Manual training	3,360	1,047

By a majority of five to one, also, the replies favored the teaching of physiology. No single school district failed to return an affirmative majority on any single subject. Over half of the replies, it is estimated, were made by taxpayers.

Harvard's victory in the 'varsity race at New London will stimulate anew the somewhat flagging interest in rowing at Cambridge. Unfortunately, it will also, we fear, fasten the professional rowing coach upon Harvard for a long time to come. Wray has not yet proved himself the match of Courtney at Cornell, but this one victory will make him seem indispensable to many friends of a college which has had only four rowing successes in the last twenty-one years. This we cannot but regret. In the long run, Harvard in particular and college athletics in general, would have benefited far more had the Cambridge authorities stuck to graduate coaching, even at the price of a still longer list of defeats. But the younger graduates insisted on a professional trainer, and a weak Athletic Committee yielded to their opinion. As a result, the contest at New London is primarily one between Wray and Kennedy, and will become year by year more of a duel between these trainers. Meanwhile, the old idea of sixteen young men trained by themselves or their friends and rowing for pure sport, which ruled in President Eliot's day and still holds in England, is relegated further and further to the forgotten past. At Poughkeepsie, for instance, the only question the visitor need ask himself annually is whether or not Courtney has got his material licked into shape. If he has, the outcome is practically certain.

Match play vs. medal play is a question which Horace Hutchinson, the English writer on golf, has been discussing, and which is forced on American attention also by the open championship tournament just ended. Why should the amateur championship be determined by match play, while the open or professional championship is awarded to the

man returning the lowest score after four rounds of medal play? For match play, it may be argued that it pits man against man, and not a man against an ideal score, and so brings out the personal element which adds so much to all competitions in sport. Then there are the delightful surprises, the lucky accidents, the constantly changing aspect of the match. In such picturesque uncertainty, match play is superior. On the other hand, advocates of medal play urge that the object of a tournament is to ascertain, not who is the luckiest or sporadically most dashing player, but who is the steadiest, the most even—in a word, really the *best*. With this end in view, medal play is the only sure test. By this standard, perfection is the aim all through. You cannot indulge in the pleasant sins of slicing or pulling, and comfortably hope that they will not make much difference in the end. Every stroke lost goes down against you. It cannot be denied, however, that, compared with match play, medal play is dull and monotonous. The sight of a hundred men going sternly through a long competition, not with each other, but with an abstract measure of excellence, is not inspiring. Professionals, no doubt, attack the business in a cool and matter-of-fact fashion, as all in the day's work, but to the amateur it is certainly irksome, and for the spectator depressing. These differences fit in well with the differences between the amateur and the professional spirit; so that it is just as well to leave the matter where the golfing authorities have fixed it—match play for the amateur championship, with medal play for the professional.

Disaffection in the Preobrajensky regiment of the Guards must seem to the Czar a final insult. No military organization in Europe has been more famous, and none more closely associated with a royal family. During the exciting days of 1880-1881, this regiment was the mainstay of the Czar Alexander II. When the anarchists in February, 1880, blew up the guard room of the Winter Palace, the dead and wounded were of the Preobrajensky regiment. Its battalions were the first on the spot after this explosion, and to its "ever-loyal members" was granted the privilege of standing watch over the body of the Czar, when he finally became the victim of an anarchist's bomb. Till within a short time before his death, Alexander II. had regularly observed the custom which required the sovereign to bivouac with the regiment during the manœuvres at Tsarkoe-Selo; and he slept among the men with no special guard beyond the regiment itself. That within a quarter of a century this picked organization would openly rebel, defy its officers, demand political and military reforms—
even a free reading room with the revo-

lutionary newspapers they would not look at in 1881—nobody could have imagined. The Czarina herself might as readily have been expected to take up arms. Truly, the Czar seems nearly as helpless as Louis XVI. when he faced the Parisian mobs at Versailles.

Despite the universal weariness with the Education bill, the Liberal Government continues to hold its majorities of nearly three hundred. Last week a substantial concession was made to the Opposition, by authorizing denominational teaching in schools when it is requested by four-fifths of the parents of the pupils. In principle, this approaches the Prussian system, and the result will be, in effect, to continue such denominational schools as can secure the virtually unanimous support of their communities. The compromise will permit a certain number of voluntary—mostly Church of England—schools to come under national control without any essential change in character. So far the bill makes for religious conciliation. The defect of the clause, from the point of view of the broadest interests of public education in England, is that by establishing two different sorts of elementary schools, it leaves a remnant of denominational institutions to be dealt with later. But one can hardly blame Mr. Birrell for deciding to make two bites of the rather unmanageable cherry of secularization.

Discussion of the proposed new income tax in France has provoked a debate about the distribution of wealth in that country. M. Jaurès had affirmed, *en bon socialiste*, that 221,000 persons, "not a single one more," owned 60 per cent. of all the wealth of France. He derived these figures from the statistics of inheritance taxes for a single year. But a skilled economist like Jules Roche had no difficulty in showing in the *Figaro* into what gross errors the eloquent orator had been betrayed. He had taken the figures for a single year, in which it chanced that fourteen exceptionally large estates had fallen. A three-year average was much fairer, and yielded very different results. We cannot go into the details, but M. Roche makes it clear that Jaurès was about 40 per cent. out of the way—as he says, "une différence appréciable." More striking, in a way, is the comparison which he institutes between inheritance taxes in France and England. The conclusion at which he arrives is that there are many more huge English estates, but that the number of moderate French estates is vastly greater. His final deduction is that, whatever the Socialists may think or allege, "there is no country where wealth is less unequally distributed than in France, more mobile, more peculiarly dependent upon labor and initiative."

The death of Manuel Garcia, the centenarian teacher of singing, recalls the changes in the musical world during his lifetime. It was given to him to see an extraordinary development of chamber music, of the piano piece, and the modern song, as well as of the opera and the symphony. When he began to revolutionize the art of teaching by his great invention, the laryngoscope, and by the theories he based upon it, Schubert and Schumann and many lesser lights were developing the "art song," whose very creation must be attributed to Schubert, despite the few pretty *lieder* of Haydn, Mozart, and Gluck. In the opera, Garcia witnessed even more remarkable changes—Wagner's revolution of the whole plan. More than that, America at the time of Garcia's birth was musically quite undiscovered, and remained so until he was well beyond middle life. He survived to see it become not only a great musical country, but able to train its own artists for opera and concert stage without the necessity of a resort to European teachers. In England, too, in his old age, he was able to notice a distinct progress in public appreciation of the best in musical art.

A German military writer calls attention to the fact that, notwithstanding all modern improvements in facilitating communication and locomotion, by telephone, wireless telegraphy, bicycle, and automobile, it has not been possible to diminish the need for horses in cavalry and artillery divisions. On the contrary, the supply of horses, so far as Germany is concerned, is falling short of the demand. While the population of the country increases by nearly a million a year, the acreage for supplying fodder for horses remains about the same, and the demand for horses even in non-military pursuits grows rapidly. Pending the time when every peasant and every merchant shall have his motor car, it will therefore be necessary to provide a military substitute for the horse. Automobiles are out of the question, because of their fragility and their uselessness on roads in the condition in which the march of an army leaves them. Under these circumstances, the only available motor is the steam street locomotive. At least, such is the opinion of Lieut. Otfried Layriz, who has written a book, "Der mechanische Zug mittelst Dampf-Strassen-Locomotive," in which, basing his deductions on the experiences of the last fifty years, he dwells in detail on the uses of these locomotives, in peace as well as in war. He admits that automobiles have their use as a means of rapidly transporting men and mails; but he maintains that for all other purposes, and they are many, the steam locomotive alone can supplement or supplant horses.

THE MUCK-RAKE CONGRESS.

Various Congresses have had various names, in characterization of their chief activities or notorieties. There was the Billion-Dollar Congress, though it will soon be well forgotten in the presence of the Two-Billion-Dollar Congress, presently to be with us. There was the Back Pay, or Salary Grab, Congress, the Credit Mobilier Congress, and so on. Judged by its first session, the Fifty-ninth Congress bids fair to be known as the Muck-Rake Congress.

As used, the phrase is not necessarily a term of reproach. It merely describes the kind of pressure and motive which led to the chief legislative enactments. President Roosevelt is quite right in saying that more general laws of a far-reaching sort were passed in the late session than in any of recent years. But the characteristic thing about it all has been the excitement, the frequent crises, the sensational methods used, the series of exposures, of special messages, of bitter controversies, of Presidential letters, and other deliverances, the steam-gauge often marking an approach to the exploding point. All this fervor and acrimony, this shouting, appeal, protest, threatening, and attack are of the essence of what has come to be known as muck-raking. Without it, we may be certain, Congress would not have passed the two measures by which the session will be chiefly remembered, the railway bill and the meat-inspection law. And the main driving power was undoubtedly the President's. The rate bill was passed in a form which he long fought, and with attendant circumstances that damaged his repute; but it was passed, and Mr. Roosevelt may justly claim the credit. In the case of meat inspection, he made a plain surrender on points which he had declared essential; but by this stooping he conquered, in the sense that he got a law, which, but for his feverish activity, we should not have seen at all.

However, it must not be thought that the Presidential programme proved to be anything like a schedule of legislation. If we compare the list of measures urged in Mr. Roosevelt's message, with the list of laws actually passed, we shall see how many rebuffs even a man of his overflowing energy and fertility of resource must encounter when he flings himself upon the inertia of Congress. Let the comparison speak for itself, including the main subjects:

WHAT WAS ASKED.	WHAT WAS DONE.
Prevention of over-capitalization by corporations.	Nothing.
Regulation of railway rates.	Passed.
Limiting hours of labor of railway employees.	Nothing.
Employer's liability bill.	Passed.
Limiting injunction against labor unions.	Refused.

Federal regulation of insurance.	Declared unconstitutional.
Economy of appropriations.	Increase of \$60,000,000.
Provision of elastic currency.	Nothing.
Prohibition of campaign contributions by corporations.	Nothing.
Federal naturalization law.	Passed.
Ship subsidies.	Nothing.
Immigration law to keep out "the lazy," etc.	Failed in conference.
Revision of copyright laws.	Nothing.
Pure food law.	Passed.
Reduction of tariff on Philippine goods.	Denied.
Citizenship for Porto Ricans.	Refused.
Joint Statehood.	Granted in different form.
Type of Panama Canal.	Settled.
Protectorate over Santo Domingo.	Refused.

Such a large admixture of failure with success results partly, no doubt, from too ambitious a programme. No President ever equalled Mr. Roosevelt in the number of measures which he "earnestly asks" Congress to pass at once; hence no other President has had to put up with so many outright refusals to budge. In one respect, however, Mr. Roosevelt's failures have peculiar significance. In domestic legislation he has had marked success; it is only in his appeals in behalf of our island dependencies, and in connection with the gorgeous dreams of a West Indian and Central and South American protectorate, that the President has been repulsed at every point. Despite his pleas, Congress remained callous to the appeals of the Filipinos, and the Porto Ricans. As for Mr. Roosevelt's grandiose Dominican policy, it again hangs unacted upon, though the friends of his treaty resisted its being brought to a vote, knowing that it would surely be rejected. These defeats indicate pretty plainly the line of least resistance just now in Congressional law-making. Large and generous legislation for unrepresented colonists can be compassed only with great difficulty. Bills to prevent political corruption die of inanition. The protected interests are left immune. But the passion for regulating corporations, for extending Federal functions in new and dubious ways, for piling up appropriations, is now so strong in the land that it visibly asserts its sway over Congress. By falling in with it, the President is able to make the energizing power of his personality seem redoubled. Whether this tendency will be permanent and wholesome, it is too soon to say; but that it is at present a mighty tide in our public affairs, is plain to even the wayfaring man.

The final verdict upon this session of Congress will be largely favorable. It was marred by no great scandals; it passed few profligate bills; it resisted the ship-subsidy clamor; it saw the freedom and power of debate rise to unac-

customed heights; it was, in general, responsive to the will of the people, so far as that will was clearly declared. Its net record undoubtedly puts the Republicans in better shape for the Congressional elections than they dared hope two months ago. But what the issues and what the result of the approaching campaign will be, many are, to be sure, asserting, but no man knows.

THE FAIR-MINDED SOUTH.

This truth at least underlies the assertion that the South must be left to settle the negro question by itself—that without the initiative and coöperation of fair and broad-minded and justice-loving men and women in the South there can be no settlement. It is, therefore, a ground for taking fresh courage when an utterance by a leading Southerner deals with this great matter in a lofty spirit; loyal to his section, yet national in his patriotism; affirming the South's peculiar duty to take the lead, yet insisting that it lead only where believers in equal laws and democratic principles can follow. Such a spirit inspires the address on "Slavery and the Race Problem in the South," delivered at the University of Georgia on June 19 by William H. Fleming.

Mr. Fleming is a man of repute and weight in Georgia. His political service as Speaker in the State Legislature and member of Congress for three terms was honorable, and his professional standing is shown by the fact that for a year he was President of the State Bar Association. An alumnus of the University of Georgia, he went back to speak on a platform dedicated to free speech by the lamented Chancellor Hill. In fact, Mr. Fleming states that the late Chancellor highly approved his choice of a topic, saying to him, just before being stricken by fatal illness: "I wish my platform at Athens to be a place for the freest expression of honest thought."

In the rather sordid Georgia campaign, where rival candidates for the Governorship are competing in promises of negro disfranchisement, Mr. Fleming's speech has a bracing sound. Not temporary and partisan advantage is his aim, but lasting decisions conceived in justice. With a fine gesture, he dismisses "that trinity of impossibilities—deportation, assimilation, or annihilation"—and says, "Let us offer the simple plan of justice." Himself a firm believer in race purity and white supremacy, Mr. Fleming shows by a broad statistical survey how chimerical is the notion of negro domination, and concludes that "the white people of the South, and especially of the State of Georgia, can now proceed to work out their racial problem on lines of justice to the negro. . . . Those fears which once appalled us we may now dismiss and let reason resume its sway."

Mr. Fleming gave one warning which ought to be heeded, for it is based on accurate knowledge. This was that the South can expect no alteration in the Fourteenth and Fifteenth Amendments to the Constitution, except "in the direction of placing under Federal control the entire subject of suffrage qualifications in all national and State elections." "The less we agitate it the better." And the lawyer in the speaker also had some direct things to say about the schemes "to disfranchise the negro by a fraudulent administration of the law." By no other means could the promise be kept of entirely "eliminating" the negro without depriving "a single white man of his ballot, no matter how illiterate or ignorant he may be." Of the various tricks used by the officers of registration in other States, in order to turn away from the polls negroes legally qualified to vote, Mr. Fleming spoke with proper indignation: "It is on this miserable bare-faced scheme of fraud that our proud and noble people are asked to rest their safety and their civilization!" Even of the "grandfather clause"—that favorite device to include white illiterates while excluding black—he expressed the opinion that, whenever the Supreme Court came fairly to pass upon it, it "must fall of its own crookedness."

In lieu of further epitome, we insert a few of the more striking passages from this notable address:

Not only is this campaign against the negro unnecessary and unjust, but it is most inopportune at this juncture. When every county in the State is calling loudly for more labor to serve the household and till the fields and develop our resources, why should we seek to enact more oppressive laws against the labor we now have?

Suppose we admit the oft-reiterated proposition that no two races so distinct as the Caucasian and the negro can live together on terms of perfect equality; yet it is equally true that without some access to the ballot, present or prospective, some participation in the Government, no inferior race in an elective republic could long protect itself against reduction to slavery in many of its substantial forms—and God knows the South wants no more of that curse.

Are there two codes of morality, one for individuals, and another for aggregations of individuals? Can we practise fraud as a collective body of citizens and still preserve our personal integrity as individual citizens?

Let us solve the negro problem by giving the negro justice, and applying to him the recognized principles of the moral law. This does not require social equality. It does not require that we should surrender into his inexperienced and incompetent hands the reins of political government. But it does require that we recognize his fundamental rights as a man, and that we judge each individual according to his own qualifications, and not according to the lower average characteristics of his race. Political rights cannot justly be withheld from those American citizens of an inferior or backward race who raise themselves up to the standard of citizenship which the superior race applies to its own members.

When we place such a deliverance as this of Mr. Fleming in contrast with that of Senator F. McL. Simmons of North Carolina, in the last *Independent*, we have the fair-minded and progres-

sive South alongside the narrow and stagnant, and are left in no doubt which one has the future in its keeping.

THE ARTIST IN OUR WORLD.

The follies of the time and his own frailties did everything possible to undo the great artist in Stanford White, but, fortunately, did not wholly succeed. The pleasure-house which was the scene of his murder remains an imposing monument to his genius; a few more fine buildings testify to the playfulness and exuberance of his inspiration. Many structures of his firm (McKim, Mead & White), the credit for whose work was rather indiscriminately given to the member most in evidence, bear the sign manual of his taste. Yet a review of the work definitely assignable to him shows that it is small in comparison with his powers and with the impression he made upon his colleagues. In actual creative quality, probably only Richardson among American architects was his equal. In physical force he was indomitable. Once he rode all night over the roughest of mountain trails to keep an appointment which he was in danger of missing because he had gone from New York to New Orleans to witness a prize-fight. Why was it that, with the energy and knowledge of the great architects of the Renaissance, and with a wealthy patronage fairly rivalling that of the Medici princes and popes, his work seems so incomplete and episodic?

Severe moralists will find the cause in his devotion to pleasure. Many another great artist, however, has been overmastered by the flesh, with no apparent detriment to his art. His colleagues explain that he was in a sense misplaced, being by temperament and gift rather a painter and decorator than an architect. But this does not really explain anything. It is the essence of genius to make its own opportunities, and his was genius of a high order. An achievement that would be creditable for a smaller man, is confessedly inadequate for him. Surely, then, we have to do with a capital case of unutilized or even perverted energies. He seems to have been in a large degree the victim of the society which he sought above all else to please, to which he was the titular arbiter of taste.

His own æsthetic standards were the highest; but insensibly, as he sold his taste to a wealthy but half-trained society, he condescended to their ignorance and vanity. The time that he should have given to creative design, he spent in despoiling French and Italian country houses of their fittings and furnishings, and he adorned many an American mansion with irrelevant plunder of this sort. Enormously profitable as an incident to his profession, this traffic was naturally congenial to a passionate collector of every sort of art. The fallacy

of the undertaking will be realized when it is noted that the shiploads of antiquities he furnished to his plutocratic clients contained very few objects above respectable mediocrity, while he himself, one of the most-talked-of collectors of our time, has left personal accumulations inferior to those of amateurs of far smaller wealth and opportunity. In other words, he offered the tragic spectacle of a taste gradually adjusting itself to that of its market. Though immensely the superior of his world, he was content to be its purveyor. His career, as you choose to regard it, is that of a magnificent condottiere in architecture, who won brilliant skirmishes, but avoided the laborious operations of sieges and great campaigns; or of an æsthetic major domo to an opulent world, whose especial vanity was the possession of fine works of art. Stanford White gave his clients quite as good as they deserved or wanted, but meantime, in such brokerage, he wasted precious days that should have seen a succession of his own masterpieces.

We have thus dwelt upon this remarkable career because it is typical: it illustrates with singular and pathetic emphasis the defects of art patronage among us. It is, we believe, the business of the artist to please his public, but it is also his privilege to educate his patrons. In the great periods of art the painter and his patron have met on something like equal terms; in fact, the man who pays the money has been very willing to learn from the artist. Between the two classes, under these circumstances, there is a lively and profitable interchange of ideas. Such was the case in the courts of Philip of Burgundy, the Emperor Maximilian, of Charles the Fifth, the Medicis, Sforzas, D'Estes, Louis the Fourteenth; such was the case in the republics of Athens and Florence, and in the Venetian oligarchy. But the artist in America who to-day addresses himself to his natural patrons in the wealthiest classes, meets either a disheartening indifference or a more positively demoralizing vanity.

Possibly, indifference is the more sinister attitude. There is no greater enemy of the artist than the man who, while he fills his house with objects of art, as he fills his greenhouses with orchids, or his stables with thoroughbreds, neither knows nor loves the splendid things his money buys. To the artist, appreciation is the breath of life. For him to be in the position of merely giving a money's worth is suicidal; to be habitually and consciously giving less is artistic death in life. Yet this is the danger that constantly threatens the artist in a day of indiscriminate accumulation. It was a danger that diverted and diminished the career of the artist we have lost. With the arrogance that pretends to know, Stanford White was able to cope. To the vanity that did not care

but could pay lavishly he became a victim.

His career points the difficulty of the middle way that the artist must follow to succeed. A generation earlier or later, we are fain to hope, the flowering of such a genius would have been more normal, and the fruit more abundant. Our age has tended to debase the artist to its own standards, or to shut him up in the musky atmosphere of adoring cliques. The frittering away of genius, as illustrated by the apparently successful career of Stanford White, is an exhortation to all true artists to master that most difficult art of being in the world, but not of it.

FRAGMENTARY SIDE OF THE CLASSICS.

A considerable portion of the *School Review* for this month is given up to a discussion of "The value of humanistic, particularly classical, studies, as a preparation for the study of medicine and of engineering." Professors Vaughan and Hinsdale of the medical schools of Michigan University, and Professor Williams of the engineering department, all agree that the student of medical or engineering science is badly off with "small Latin," and may profitably spend considerable time upon Greek. There is a singular unanimity in the old-fashioned opinion that the study of the classics is more disciplinary than that of the newer subjects which the elective system has imposed upon the secondary schools.

All three speakers dwell upon the value of classical studies in cultivating habits of mental precision. Professor Sadler gives the sense of the meeting when he says:

As a means of inculcating ideas of exactness the study of the humanities is *facile princeps*. The niceties of translation, the importance of gender, number, and case, the proper use of the moods and tenses, and the demands of the relative clause, compel the mind toward a certain definiteness which is lacking in many of the subjects taught in the early stages of education. The most simple translation, or even the study of the grammar of these subjects, demands a directness of attention and a consideration of detail which cannot be otherwise than beneficial to a student whose work in the future will lead him into subjects where generalization is impossible.

About this view there is nothing novel: it has been held by generations of school teachers, and it has been seriously challenged only in our own times—in the name, be it noted, of specialization. Highly significant, then, is a plea for the classics from the ranks of those who are specialists themselves and whose task is to educate specialists. These practical men join Charles Francis Adams and other educational theorists in reverting to the immemorial ideal of athletic mental training as opposed to premature accumulation of special information.

These teachers of medicine and engi-

neering had all found their greatest obstacle in a prevailing intellectual flabbiness among their students. President Thwing, in an article on "College Students as Thinkers," in the *North American Review*, reluctantly notes the same tendency. He regrets that in some cases "an easy-going system [the elective system] results in a neglect of the intellectual severities and virilities." Dr. Thwing refers us to the hopeful fact that "the Anglo-Saxon man, too—even if he be the college man—has the primary power of self-correction." Apparently, a certain number of medical men are distrustful of these automatic healing processes, and would prescribe rather frequent stiff doses of Greek and Latin.

A special plea for the humanities was made by the representative of the engineer's profession. He recalled the intimate relation between engineering science and great commercial exploitations. On the technical side, an engineer making a report or presenting a project, should command the most lucid English and a ready pen. Considering his calling more broadly, he must be able to cope socially and intellectually with all manner of men. In a very true sense, he must be a man of the world, with an easy possession of the niceties of human intercourse. Professor Sadler did not exalt his ideal engineer to the level of Castiglione's ideal courtier, but none the less he outlined a character which, according to the traditional view, is best formed through studies at once difficult and humane.

At present there is indubitably a movement of educational thought back towards the older disciplinary ideals. The discussion we have noticed, and the evidence presented in Dr. Thwing's article, are merely typical expressions of a widespread misgiving. Have the various substitutes for the classical languages fairly justified themselves as disciplinary equivalents? This question cannot be answered satisfactorily until the modern languages, history, and the elements of the sciences have worked out their own definitive methods. One may admit that French and German have fairly warranted the proud title applied to them by President Woodrow Wilson when he hailed "the new humanities." But the case for the varied and crowded curriculum, whether in the college or secondary school, is not yet completely convincing.

In any event, the theory that either in school or college a large fund of intrinsically "valuable information" may be imparted, is being seriously challenged. The doctors scoff at school physiology; engineers make little of the studies preparatory to the technical school; lawyers, we dare say, would rather have a pupil who had had his fill of Cicero and the Latin historians than one who had made a premature ac-

quaintance with the common law. In fact, no one who proceeds to a specialty is likely to set a high value on the mere intellectual accumulations of his school and college years. There is only too much truth in the saying that what we remember is less important than what we have forgotten. It is easy to see that in the apparent drudgery of memorizing declensional forms, and in the mere exercise of rearticulating the words of a Latin period into an English sentence, the youthful mind learns to act cleanly, to deal, in short, uncompromisingly with the inexorable.

It should be noted, however, that if we are to witness a renaissance of classical studies, teachers of Greek and Latin will have to do their part. The present age is not likely to admit a monopoly of disciplinary value in any two branches of learning. The partial supersession of the classics has been due to the fact that classicists rested on authority and tradition, and failed to demonstrate that the old discipline had lost none of its validity through the new ascendancy of the natural sciences. The evident desire on the part of scientists for a revival of a more severe mental training should be a Macedonian call to despondent classicists in school and college. If they will lead the way towards practical humanism, as opposed to heterogeneity, they will not lack a following.

THE CAMPAIGN AGAINST TUBERCULOSIS.

The second annual report of the Henry Phipps Institute for the Study, Treatment, and Prevention of Tuberculosis—a document of some four hundred and fifty pages—contains much matter that is of interest to layman as well as physician. The report is based on the observation of 885 new cases. Dr. Lawrence F. Flick, the director, lays much stress on the fact which, though not novel, cannot be over-emphasized, that tuberculosis is produced by the artificial conditions of life indoors. "Of all diseases," he says, "tuberculosis more than any other is a house disease. It is implanted in the house, develops in the house, and it matures in the house." The first step, therefore, in the task of prevention is to provide proper houses, both to work in and to live in. Light and ventilation for shops and factories is a subject which has already been fully discussed. Dr. Flick is more concerned for the moment over the question whether private houses or apartments are more likely to be nurseries for the disease. His conclusion is that apartment houses (including those of all grades), "as they have been built in the past," are undoubtedly a more serious source of danger than private houses. Cleanliness, ventilation, drainage, comfort, and convenience he enumerates as the factors which count most for health;

and, he adds, a "greater amount of comfort, convenience, and sanitation is procurable with the money at the command of a laboring man in an apartment house than in a private house, provided apartment houses are built with these objects in view, and not for the mere purpose of making money for the landlord."

This last proviso brings us face to face with one of the gravest of problems—that of securing a sufficient number of tenements built primarily for promoting health rather than returning income on investment. Dr. Flick himself suggests no way out of the difficulty. Obviously, in cities like New York or Philadelphia, or even in smaller places like Providence or Buffalo, the bulk of the laboring population must, for a long time to come, be forced into houses which are constructed as mere business ventures. So far as we can look into the future, "model" tenements, built by private capital, can at best be scarcely more than a drop in the bucket. Stringent building laws may accomplish something; but when the landlord has his eye first of all on gain, he will, in spite of inspectors, "scamp" his plumbing. This is the strongest argument offered by advocates of municipal housing for the poor—that the only safeguard against tuberculosis and other maladies is a landlord who can and will set sanitation above everything else.

The troubles of the indigent consumptive are aggravated by certain other conditions on which Dr. Flick dwells. The sufferer is inevitably compelled to seek the most wretched and unwholesome of all the tenements. A man who is coughing and manifestly breaking down is so objectionable to neighbors that landlords want to get rid of him. This is generally easy enough, for the tuberculous laborer can earn but little; he is often without money on rent-day; and he has no alternative but to get out. Thus it is that only the houses which do not rent well are open to poverty-stricken consumptives; and these unhappy people "circulate in the worst and most unsanitary houses, and infect each house into which they move."

The symptoms of tuberculosis are not at all well understood by the inexpert, or indeed by many physicians. At first the malady does not greatly discommode its victims. The average physician does not recognize tuberculosis in a stage earlier than that in which tissue has been destroyed; in all probability he is rarely consulted in an earlier stage. This earlier stage may be found in cases diagnosed as "stomach trouble, neurasthenia, malaria, and many undefined conditions passing current under some convenient name which means nothing." Indeed, Dr. Flick makes the round assertion: "The probabilities are that all people who are considerably below normal weight for their height are so on account of dormant

tuberculosis." On the other hand, though the tuberculous subject is by tradition emaciated, nearly one-half the patients who apply at the Phipps Institute are recorded as looking well. "It is surprising," says Dr. Flick, "how advanced a tuberculous subject may be and yet retain the appearance of physical well-being." The symptom which is most frequently misunderstood and misinterpreted, even by physicians, is that of cough. According to Dr. Flick, "tuberculosis of the lungs in itself does not produce much cough, and [as his tables show] may be entirely free from cough." Moreover, tubercle bacilli are not found in the sputum until the disease has gone beyond incipency; and even when the tissue has begun to break down, the bacilli are not always in evidence.

As to treatment, this second report adds but little to what was said in the first about nourishing food, rest, and fresh air. These are the three luxuries which the poor are unable to command. Under the goad of necessity they neglect the disease until it has made such headway that it has begun to incapacitate them. The huge undertaking, then, that confronts those who have enlisted for the stamping out of tuberculosis is to persuade people to consult physicians in regard to all symptoms that are not those of acute and brief illness; to teach physicians to recognize the early phases of the disease; and to furnish for the imperilled poor a supply of nourishing food and good housing on a scale hitherto unknown.

THE MOST VALUABLE AMERICAN-PRINTED BOOK.

The most valuable American-printed book, which has long been sought after, but of which no copy has hitherto been known to exist in recent times, has, true to prophecy, at last come to light. This is no less than the first printed collection of the laws of the colony of Massachusetts Bay, issued from the press of Matthew Day at Cambridge, in 1648. After years of fruitless search by students and bibliographers, a copy has now turned up in a small private library in England and has been purchased by Dodd, Mead & Co. of this city. The title of this book, beside which the famous "Bay Psalm Book" is, in point of rarity, a common volume, and in point of historical interest far inferior, is in full, as follows:

The | Book Of General | Lawes And Liberties | Concerning The Inhabitants Of The Massachusetts | Collected Out Of The Records Of The General Court | For The Several Years Wherin They Were Made | And Established, | And now revised by the same Court and disposed into an Alphabetical order | and published by the same Authority in the General Court | held at Boston the fourteenth of the | first month Anno | 1647. | VVhosoever therefore resisteth the power, resisteth the ordinance of God, | and they that resist receive to themselves damnation. Romanes 13.2. | [Ornament] Cambridge. | Printed according to order of the General Court. | 1648. | And are to be solde at the shop of Hezekiah Usher | in Boston |

No other "lost" book has been more zeal-

ously hunted for. Such special investigators as George H. Moore, William H. Whitmore, and Dr. Samuel A. Green have ransacked all contemporary writings, manuscript and printed, in search of data concerning it. When the city of Boston published in facsimile the collections of laws of 1660 and 1672, with the intermediate session laws, Mr. Whitmore, record commissioner of the city, and a recognized authority on matters relating to antiquities of Boston, prepared an accompanying "Bibliographical Sketch of the Laws of Massachusetts Colony from 1630 to 1686." In this he devotes thirty-four pages to the discussion of this first printed collection and to transcripts of contemporary statements concerning it. He even succeeded in building up (from citations) a fairly exact table of contents; but he failed in the very vital matter of the date. He speaks throughout of "The Code of 1649."

The story of this first printed law book is most interesting. After congratulating the colonists that in New England the church and the civil state had been "planted and growne up (like two twinnes) together like that of Israel in the wilderness," the editors, or compilers, go on to tell something of the origin of the book:

For this end about nine years since wee used the help of some of the Elders of our Churches to compose a modell of the Iudicial lawes of Moses with such other cases as might be referred to them, with intent to make use of them in composing our lawes, but not to have them published as the lawes of this Jurisdiction: nor were they voted in Court. For that book intituled *The Liberties, &c.* published about seven years since (which containes also many lawes and orders both for civil & criminal causes, and is commonly (though without ground) reported to be our Fundamentals that wee owne as established by Authority of this Court, and that after three years experience & generall probation: and accordingly we have inserted them into this volume under the severall heads to which they belong yet not as fundamentalls, for divers of them have since been repealed, or altered, and more may justly be (at least) amended heerafter as further experience shall discover defects or inconveniences for *Nihil simul natum et perfectum*. The same must we say of this present Volume, we have not published it as a perfect body of laws sufficient to carry on the Government established for future time, nor could it be expected that we should promise such a thing.

These Lawes which were made successively in divers former years, we have reduced under severall heads in an alphabetical method, that so they might the more readily be found, & that the divers lawes concerning one matter being placed together the scope and intent of the whole and of every of them might the more easily be apprehended: we must confesse we have not been so exact in placing every law under its most proper title as we might, and would have been: the reason was our hasty indeavour to satisfie your longing expectation, and frequent complaints for want of such a volume to be published in print: wherin (upon every occasion) you might readily see the rule which you ought to walke by.

The manuscript "book intituled *The Liberties &c.* published about seven years since," referred to in this Preface, was the first body of laws drawn up and adopted for the Colony. It had been composed, mainly at least, by the Rev. Nathaniel Ward of Ipswich, the author of the famous book, "The Simple Cobbler of Agawam." This famous "Body of Liberties" was not printed, but transcripts were made for the use of the various officials requiring them.

The records of the General Court, under date of December 10, 1641, contain the following entry:

Mr. Deputy Endicot, Mr. Downing, and Mr. Hawthorne are authorized to get nineteen Copies of the Laws, Liberties and the forms of oaths transcribed by their several hands, and none to be authentic but such as they subscribe, etc.

No one of these nineteen certified transcripts seems to have come down to our day, but a contemporary copy, which formerly belonged to Elisha Hutchinson, is now in the library of the Boston Athenæum.

It is a curious fact that, though this first Law Book of 1648 had itself been so completely lost, the exact number of leaves in the volume, the number of copies printed, and the cost of the printing and paper for the edition have long been known. This information was discovered in some papers relating to a suit by the heirs of Jesse Glover, who had brought the first press to America, but who died on the passage over. This suit was against President Dunster of Harvard, who had married Glover's widow, and who for fifteen years was the actual owner and manager of the press. This entry reads as follows:

The Law Book, 17 sheets, 600 copies, using 21 reams of paper. Sold at 17 pence a book, £42 10s. The printing cost £15 16s. 3d., and the paper £5 5s.

Now, an examination of the book shows that this record as to its size is correct. It is made up of signatures A, B, C, D, E, F, G, and H, each 4 leaves, and probably I, 2 leaves, in all 68 leaves, consisting of: Title, p. [i]; blank, p. [ii]; Preface, pp. [iii-iv]; text, with heading "The Book of the General Lawes and Libertyes concerning, &c.," pp. 1-59, blank, p. [60], followed, probably, by the Table, 2 leaves, not in this copy. The margins in this copy are entirely uncut; the leaf measures 12x7¼ inches.

Although, as is shown by the printer's statement quoted above, six hundred copies of this Law Book of 1648 were printed, it soon became scarce. The Preface to the edition of 1660 begins:

The Book of Lawes, of the first Impression, not being to be had for the supply of the Country, put us upon thoughts of a second.

Some explanation of this scarcity may perhaps be found in a petition to the General Court of Richard Russell, Treasurer of the Colony, dated the 22d day of the third month, 1651:

Whereas By ye Courts Incoradgment I purchased ye Last printed Law Bookes, and by reason of ye Courts Alternation of summe things in those bookes made them unvendible Insomuch that your petitioner Lost above Tenn pounds, a great pt. Turned to wast pap'r and many of them Burnt, your Petitioner desires this Court would Tenderly Consider ye same, etc.

Mr. Whitmore thought this referred to the first volume, called by him the "Code of 1649." After various calculations he made the deduction that "it will be safe to say that at least one-quarter of the edition [of six hundred copies] was destroyed before A.D., 1651." From the expression "ye Last printed Law Bookes," I think, however, that Russell must have referred to the volume of supplemental laws, which was printed in 1650, and which I shall refer to later.

While there are a considerable number

of laws in the 1660 collection which are not found in the 1648 volume, only one law of those promulgated in 1648 seems to have been repealed before 1660. This is the law against Ana-Baptists, which was passed in 1644. The last paragraph only, somewhat modified, appears in the 1660 volume, under the head of "Heresy."

In the 1648 volume the laws proper end in the middle of page 55, the lower part of this page, and pages 56-59 are filled with various forms of oaths, declarations, etc., for the use of the various officers, headed "Presidents and Forms of things frequently asked." These are practically the same as those of the 1660 edition, except that the 1660 volume contains three additional forms. One form only, that for the auditor-general, is found in the 1648 book, and not in that of 1660.

This volume of the "Lawes and Libertyes" of 1648 is not the only lost law-book of the Massachusetts Colony. Besides certain single-leaf "Capitall Laws," probably broadsides, Mr. Whitmore has made out from the records that the laws passed at the intermediate sessions of the General Court were printed as three supplements to this first book. The first of these was undoubtedly printed in 1650, and included laws passed during the latter part of 1648, 1649, and a few earlier laws which had been thrown out by the editors of the first printed compilation, but which were afterwards incorporated in the general body of laws. The second of these supplements, including new laws passed during 1651, 1652, and 1653, was sent to the press in accordance with a resolution dated May 3, 1654. A third supplement, covering the laws of 1654, 1655, 1656, and 1657, was undoubtedly printed in 1657. No copy of any one of these three supplements, which were probably thin pamphlets of a few leaves each, is now known to exist. The earliest printed volume heretofore known is the second compilation, that of 1660, in which the laws of the four earlier books were collected, rearranged, and occasionally altered in their wording.

In 1641 there was printed anonymously in London a small quarto volume having the title: "An Abstract of the Lawes of New England as they are now established." This is not what it purports to be. It is a series of ecclesiastical laws drawn up by John Cotton, and very probably the "copy of Moses his judicials, compiled in an exact method," which by previous request, Cotton presented to the General Court on October 25, 1636. They were never adopted, but instead the larger compilation drawn up by Nathaniel Ward, the "Body of Libertyes," was adopted in 1641. L. S. L.

THE COMMISSIONERSHIP OF EDUCATION

Dr. William Torrey Harris has retired after seventeen years of service as United States Commissioner of Education, and Prof. Elmer Ellsworth Brown of the University of California is appointed his successor. Below are discussions of the importance of the office, the personality of the two men, and their contributions to education:

The office of Commissioner of Education has never before commanded so great a man as Dr. Harris. Before his coming, the

place was, rather obscure and unimportant. Probably no one thought that the bureau might be raised to prominence and power. The salary, until lately, was ridiculously small, and even now it is considerably less than is paid a number of State and city superintendents of schools. The Government has never treated the office with deserved respect. The disposition of matters that should naturally be in charge of the bureau is an example in point. Philippine school affairs are managed by the War Office; Indian education is a separate organization; agricultural instruction is carried on without reference to the bureau. Inadequate financial support has still further retarded the expansion of the bureau into a national clearing house of educational experience. With the right attitude on the part of the Government, the bureau, with Dr. Harris as its chief, could have been converted, without interference with jealously guarded local prerogatives, into a powerful lever for educational improvement throughout the United States.

Dr. Harris owes nothing to the bureau. His reputation here as well as abroad was solidly established long before he took the office; in fact, he had won a place in the history of American education, in line with Thomas Jefferson, Horace Mann, and Col. Francis Wayland Parker. He is the most commanding figure in the educational field to-day. Neither England nor France nor even Germany, the home of pedagogy, has as great an intellect at work in the philosophical elaboration of the fundamental problems. Jefferson was the first to organize for American education an ideal plan, which is to-day most fully alive, perhaps, in the State of Michigan. Horace Mann announced the basal principles of the common school. Parker was a force which broke the yoke of traditional and European scholasticism, and inaugurated methods in harmony with democracy. Harris has laid the foundation for an American philosophy of education. As a preparation, a mastery of Germany's achievements and of the history of philosophy was an absolute necessity.

In the future the study of philosophy inspired and developed by Dr. Harris in his St. Louis days will be more adequately recognized than it is now as an influence in the intellectual life of America. Never were the history and the thought of Hellas, and the philosophic writings of Kant, Hegel, and Fichte, studied with keener zest, never did Homer and Dante and Goethe appeal more strongly to the leaders of an American community. "Spiritual interpretation of the universe" was the watchword. Gradually the speculative study of education was lifted into prominence. School teaching ceased to be regarded as a mere stepping-stone to something else, and a biding place for those unwilling to do manual work and not qualified for higher intellectual pursuits. The best minds were enlisted in the cause. The belief spread that the highest service to humanity was the bringing up of young men. Under the new dispensation Col. Parker was enabled to win victories for the "New Education," and William James, G. Stanley Hall, and John Dewey to find eager disciples. The Herbartians might never have arrived at their own creed and certainly would not

have found a receptive audience if Harris had not been a preacher in the wilderness. The philosophic circle of St. Louis gave birth to similar clubs in other cities. Some of its outgrowths were the Kant Club of Denver, the Goethe studies at Milwaukee, and the *Journal of Speculative Philosophy*.

When failing health compelled Dr. Harris to give up his educational position at St. Louis, he became a lecturer at the Concord School of Philosophy. His addresses upon education, especially his criticisms of new theories, soon attracted attention to him as an authority. When President Harrison appointed him as commissioner of education, there was general satisfaction. A man had been chosen whose expert judgment commanded the respect of the world. To the credit of Harrison it should be said that the appointment was not influenced by political considerations, and that in fact he knew Harris had not voted for him. At once, the bureau began to attract attention. Visitors from Europe, Latin-America, Polynesia, and the Orient came to America for light, and Washington was the first place they visited in search of information.

The commissioner's range of interests was marvellously wide. Dr. Harris is a versatile scholar. Latin and Greek are his great joy. He is especially fond of mediæval Latin hymns. "I live by them," he said lately in a private conversation. He has few equals in familiarity with Oriental languages, literature, and customs. A Chinese laundry ticket can open the sluices of his knowledge of the variety of dialects, caligraphical usages, and historical developments of the Middle Kingdom. He is regarded as one of the two greatest living exponents of Hegel. His acquaintance with economic theories and statistics has more than once provoked him to break lances with the advocates of various Utopias. When Spencerian ideas struck America, he forthwith had a laboratory established in the rear of his house, and made a thorough study of biology and related sciences. In mathematics and astronomy, and along other lines of experimentation and pure science, he has kept in touch with new developments. He is a sound critic of architecture, sculpture, painting, and music. At one time he greeted the writer on a car leaving Milwaukee, with the genial question, "What is your opinion of the Logos?" inviting and conducting a discussion which lasted a considerable time beyond our arrival in Chicago, and which had not been fully concluded when his train started for Washington.

His sympathies are as extensive and expansive as his mind. A little child in sincere search for help, a young man puzzled as to his destiny, a student on the quest for truth, can command his interest and time to almost any extent. The writer has in his possession a copy of a long letter to a small boy who had written to Dr. Harris as Commissioner of Education to find out what stories would be most interesting for boys to read. Dr. Harris tells the books he himself enjoyed when he was young, and then speaks with especial fervor of Walter Scott, whose novels, he adds, he still reads and enjoys.

Dr. Harris established the kindergarten in America as part of the common school

system. He devised the first rational plan for the classification and promotion of pupils at school. He was the first to mark out the distinctive purposes and limits of elementary, secondary, and tertiary schools and to set forth their proper correlation and articulation. Never a servile follower of German schools of speculation, he has extracted from all whatever was best and has welded it with his American philosophy. Enthusiastic agitators of new ideas have sometimes called him an arch reactionist, because his calm prevision of the future puts a damper on most cherished pretensions. From history, however, he has acquired the patience to wait for things to take the turn that he is sure some day they must. And in waiting he carefully watches his opportunities to advance the cause, ever ready to sacrifice minor points for the gain of greater ones.

To my view, Harris's greatest literary contributions are his "Psychologic Foundations of Education," and his book on "The Spiritual Sense of Dante's Divina Commedia." OSSIEN LANG.

BERKELEY, Cal., June 25.

If any younger man can be expected to carry forward the educational movement of which Dr. Harris is the protagonist, in none, surely, may hope be more confidently reposed than in Elmer Brown.

Dr. Brown is not only a teacher of practical and successful experience—who has worked his way through all the grades of the American school system, from instructorship and principalship in the public schools to headship of an educational department in a great university—he is not only a practical teacher, but a scholar. His is not the superficial pedagogy of the "faddist," or the spasmodic procedure of the empiric. He has had a thorough training in philosophy and the history of it, in psychology and the perils of it, in the classics and the perennial vitality and need of them, in history and the unchanging fact of it, in modern languages and their efficiency in education, so far as it goes. He has the advantage of many professors of the incipient science of pedagogy in possessing an uncommon sum of common sense, in being a scholar, and a man among men as well as among teachers. He is an historian of education, versed in its relations to civilization and modern civil polity. His associates in the University of California have been impressed with his accuracy of information, his modesty and tact, his hospitality to ideas, and, withal, an unobtrusive persistence of purpose and an unshaking attainment of ideals. Personally, he is an eminently just and true man; kind beyond the ordinary run of men.

Professor Brown was born in 1861 at Kiantone, Chautauqua County, N. Y. His father, Russell McCrary Brown, a farmer in Kiantone, and later in Illinois, was a soldier in the Civil War. His earlier education was obtained in the public schools of northern Illinois; in 1881 he was graduated from the State Normal School of Illinois, and began his career as a teacher in Belvidere. He taught in Illinois till his matriculation in the University of Michigan. After taking the degree of A.B., in 1889, he studied at Halle, and gained his Ph.D. in the brief period of a year. In

1890 he became principal of the High School in Jackson, Mich., but was recalled to the University of Michigan the next year, as acting assistant professor of the science and art of teaching. His success in higher education was immediate. Few young men in his field could compete with him in happy combination of scholarship and experience. Consequently, when, in 1892, the Regents of the University of California were seeking an incumbent for the newly created chair of education they chose Dr. Brown. He has so managed the department as to make it one of the most important in the university and in the direction of educational affairs in the State at large. He has, of course, been a prominent member of the educational associations and councils of California. He has contributed largely to the efficiency of the California State Text-Book Committee; and has been a vital force ever since 1895 as an *ex-officio* member of the State Board of Education.

In the University he has stood for a settled policy to elevate teaching to a professional plane as high as that of law or of medicine; and to make the department of education immediately helpful, by expert service, to the varied interests of the schools of the State. In this relation to the educational system of the State Dr. Brown has done much to further a spirit of coöperation among the various departments of public schools. He has labored for State aid in the maintenance of the high schools; and for the appointment, retention, and promotion of teachers on the basis of professional fitness alone. He has also aimed at securing a better system of text-books for the lower schools.

Since 1891, Professor Brown has been an active member of the National Educational Association. In 1897 he was made a member of the more select body, known as the National Council of Education; and of that he has been president since 1905. He was a member of the Congress of Arts and Sciences at St. Louis, and there he read a notable paper on secondary education in its relation to recent advances in psychological research. In religious organizations, too, he has performed an unobtrusive, but still executive part. He is a member of the Religious Education Association, and has been for some years a trustee of the Pacific Theological Seminary of the Congregational Church.

In his educational relation with the country at large, Dr. Brown's activities have been directed toward promoting freedom in organization and control of State school systems. He has always insisted that the prescribed studies which necessarily predominate in the earlier years of school work should be leavened in the classroom with whatever spontaneity of method teacher and pupil may jointly evolve; and that the larger freedom of election in the later years be safeguarded by the personal direction and assistance of teachers who know enough to be more than methodical or formal.

A more industrious, and at the same time original and inspiring writer on educational topics than Dr. Brown, would be hard to find in America. A list of his occasional articles, scattered through pedagogical magazines and reviews and periodicals of more general interest, would occupy about

one-half of the space available for this notice of his career. There are monographs on all sorts of phenomena dear to the magisterial mind, from children's drawings and manual training, up to education and national character; from graduate instruction and the baccalaureate course in relation to the professional schools, and secondary instruction, all the way down to naughty boys. His book, "The Making of Our Middle Schools" (Longmans, Green & Co., 1903), is a recognized authority on the history and organization of our secondary schools. It is at once the most complete and scholarly survey of the subject that we possess, and the most seductively constructed. It actually entices one to whom the word "pedagogy" is a source of shudders. For Professor Brown has not only a keen appreciation of historical and literary values, but also an ability for historical presentation and an admirable gift of literary expression.

CHARLES MILLS GAYLEY.

GERMAN ART IN LONDON.

LONDON, June, 1906.

Apart from the big annual shows, there are, this summer, large and important exhibitions of Flemish and modern Belgian artists at the Guildhall, of early German art at the Burlington Fine Arts Club, of Munich artists at the Grafton Gallery, of modern German art at Prince's, Knightsbridge, of modern Austrian art at Earl's Court. It looks as if there had been some sort of general plot to force upon the British public facilities for studying the German and kindred schools. In truth, however, it is the merest chance that these different exhibitions should be held at the same time.

As for the opportunity to study these different schools, it is by no means what might be expected from the number and size of the exhibitions. To begin with the Guildhall, unquestionably one of the most interesting of all. The historical sequence is followed with fair success from the Van Eycks, Memlings, Malense, through Rubens, Jordaens, Van Dyck, down to Alfred Stevens and Braekeleer, Jan Van Beers, and Fernand Kbnopff. The Flemings are well represented, though not as well as in Bruges three years ago, while the room in which they hang is so crowded that they cannot be seen with pleasure—the last thing, however, the Morelian looks for from a picture. In comparison too little space has been reserved for Rubens and his group, nor is it easy to understand the principle on which the examples here have been chosen. But if it is unexpected to find Franz Hals among the Flemings, it is none the less a delight to see his "Young Man Playing a Guitar," lent by Earl Howe; a study so animated, so alive in its simple, straightforward realism, that Rubens's exuberant vivacity seems in comparison to have the reality only of a brilliant pose.

The modern work is disappointing. It was not possible to show very much; therefore, nothing but the very best should have had a place. There is, however, a great deal that is anything but the very best. The large historical pictures by Baron Leys, Willem Geets, De Vriendt—artists who have been of such service to Mr. Abbey and some of the English paint-

ers of history—are characteristic, though it would have been easy, surely, to find finer canvases by Leys. Two or three of the paintings by Alfred Stevens would explain his reputation, if it needed explaining—beautiful little interiors, in which the subject counts for as little as in the pictures of Ver Meer or Terborch, and all the beauty is in the color, the quality, the tone; but they suffer from having in their midst his large, flashy "Fedora," a portrait so meretricious, so vulgar even, one can only wonder how Stevens came to paint it. The modern who really stands out with most distinction is Braekeleer, not half as well known as he ought to be. From one picture, "Antwerp," you look out upon the roofs and gables and towers of the town with a woman who sits sewing at the open window of a room as bare and unadorned as her dress is poor and simple. But in this emptiness, in this simplicity, the modern painter has seen, and has made us see, as much loveliness as Ver Meer found in the detail to which too many artists to-day think they must return in search of the pictorial. It is wonderful how the gray, quiet light, the cool, restful atmosphere of the room, is suggested, though the town is seen red and brilliant; wonderful, too, how carefully everything is studied, even to the reflections in the sashes of the window opening inward. Braekeleer died all too soon. For the rest, most of the modern Belgians have been represented to greater advantage at the International.

I need say little of the show at the Burlington Fine Arts Club. It is restricted to early German art, and has been easier to arrange successfully than a collection that attempts, as at the Guildhall, to cover several centuries. There is no question of its importance to the student—especially the student whose interest in art is archaeological. But few Primitives suffer so much from having their work displayed away from the place for which it was designed as the German. Primitives ought always to be seen in churches, or in palaces, or on the panels of old chests—that is, on the walls or objects they decorated. The early Germans never had the same feeling for beauty and grace as the early Italians; and in the cold light of museums or galleries they impress you chiefly by the clumsiness of form and line, the unrelenting realism of painters who are determined to give you Nature as they saw it, and whose models were not so apt to familiarize them with beauty as those of the Italians. Much of the early work is extremely curious, but hardly more until you come to Cranach and Dürer. A surprising portrait of a lady by Cranach shows how well the genius among these early painters could feel and express character, notwithstanding his flat modelling and the apparent joy with which he reproduced and dwelt upon every detail of an elaborate costume. The Dürer paintings are not so remarkable as the Dürer drawings: strong studies of heads, detailed designs for armor, a proposed sketch for the "Triumph of Maximilian," a most marvellous little study of a stag-beetle—all triumphs of draughtsmanship by the artist who had the respect for sound knowledge so rare nowadays when ambition would grasp the prizes of art

without submitting to the apprenticeship. It is not only painter and draughtsman who have a place. The goldsmith and the jeweller, the medallist and the sculptor, are also included, and most delightfully. But the special value of the exhibition is that it should be held just in time to make possible a comparison between early German art and modern as illustrated in the three remaining exhibitions. Not one of these, to be sure, fills the great gap between Cranach and Dürer on the one side, Lenbach and Böcklin on the other. But though long years and centuries are not accounted for, it is evident that, no matter how much German art has developed, or retrograded, as you will, it has retained something of the old tendencies and character.

The exhibition at Knightsbridge undertakes to cover the entire field of modern German art. Inspired by the International, its immediate organizers are certain British artists who have sold pictures to, and received honors from, the German Government, and who have felt they should make some effort, in return, to encourage German art in England; and they have had the support of a number of more or less well-known people who believe an "Anglo-German understanding" can thus be promoted. Unhappily the enterprise was rushed through too emotionally, or too fast; and the present exhibition is not worthily representative.

There are no pictures by Menzel, nothing except a few drawings, and these cannot compete with the fine series shown by the International only a few months ago. When all is said, it is to the work of Menzel one returns from the experiments and new departures, the secessions and sensations so dear to the modern German artist—to Menzel, the supreme draughtsman, the master. He dominates German art for the better part of a century, but there is no sign, no suggestion of this domination. If you did not already know Menzel's position, the exhibition would not help you to discover it. Nor is this because only living painters are included.

There are two large pictures by Böcklin, another of the dominating figures in Germany during the last century, for if he was a Swiss by birth, if he lived mostly in Florence towards the end, the Germans seem to have adopted him as one of their own. Böcklin is hardly known, save by name, in England, and the pictures selected will only make Englishmen wonder why his name should be so great in Germany. One is the "Pietà" from the National Gallery in Berlin, theatrical in color and treatment as in sentiment; the other the "Elysian Fields" from the same gallery, an arrangement of the centaur, mermaids, nymphs, and romantic landscape that Böcklin delighted in, but without the beauty, the charm, the real splendor of his masterpieces. It is hard and sharp in color, it has not his usual dignity of composition, like the "Pietà"; it is theatrical, not dramatic, in feeling. And yet, even in Berlin, it should have been easy to secure a Böcklin that would have justified and maintained his reputation. And so with the only picture by Von Stuck, a "Procession of Bacchantes," a little group of Rubens-like figures in a fresh green landscape under a cloud-swept sky, animated, accom-

plished, but not one of the artist's most important canvases, though decidedly worthier of him in every way than "The Fight for the Woman," now at the Grafton.

There is no painting at all by Max Klinger, and only one, a not very noteworthy portrait, by Hans Thoma. I do not think the Lenbachs can compare to the series at the Grafton—none of the portraits equaling the "Bismarck" there; nothing by Kaulbach appears; the one Leibl, a "Young Peasant," an interesting study and little more; the one Liebermann, "Flax Cleaning in Laren, Holland" (also from the National Gallery of Berlin), is a good, sound, academic performance; the Von Uhdes, both here and at the Grafton, are the familiar Scriptural subjects interpreted in modern terms, but the least pleasing in color and composition. Stronger work by Von Bartels has already been shown in London. The best things are a Whistlerian interior and London landscape by Sauter, studies of still-life by Schuch, perhaps a quiet landscape hidden away here and there; the big and powerful (to the point of brutality) equestrian portraits and studies by Wilhelm Trübner. If few of the artists are seen at their best, neither is there any of the work the Germans can do most successfully nowadays—the large paintings, like the decorations of Klinger, or such pictures as "The Flagellants" by Carl Marr, for instance—paintings that in the German exhibitions must strike any one fresh from England with the ability and energy and courage of the painters. Instead of the distinctively German work you would prefer to find, you get reëchoes of the various recent movements—impressionism, pointillisme, and so on—movements not started in Germany.

But, with all these drawbacks, the collection seems astonishingly virile and vigorous as you see it in its present quarters, while the Academy and New Gallery are still open to mark the difference. You feel that the German artists are men who have learned their trade, who are not afraid of experiment—men who are alive. But though they are ready to adventure themselves in almost any new movement, to take up enthusiastically any fad or sensation of the moment, in their work, as in that of the early Germans, you are conscious of an unrelenting realism, of a strict adherence to nature as they see it, as they find it—nature in all its crudity and clumsiness. No matter how imaginative they may be in their subjects, there is always this insistent realism in their rendering. You can see it even in the hide of Böcklin's Centaur, in the scales of his Mermaids, and their reflections in the water. Far apart as the work at the Burlington Fine Arts Club and the work at Knightsbridge are technically, in this respect they are in close sympathy, being always essentially German.

At the Grafton Gallery the show is limited to the work of Munich artists, selected and arranged by one of the principal Munich dealers. Therefore, the variety is less, while more room has been given to artists like Lenbach and Kaulbach. To go into detail would be to come to very much the same conclusions as at Prince's.

The Austrian exhibition is a small part of a big show that is a welcome excuse for

a summer garden and outdoor theatre of varieties, where all London may amuse itself when the weather gives all London the chance. You carry away the impression—and it is all I have space now to record—that the Austrians plunge deeper into experiment even than the Germans, while their finer sense of beauty helps them to more careful selection and rejection in the study of Nature. They know what to leave out without any sacrifice of truth. I can only add that the Secessionists, here at least, prove that there is something more in their secession than the name, and that the group of Bohemians, especially in their sculpture, show a freshness of vision and observation for which I, certainly, was not prepared, simply because the very names of the exhibitors were unknown to me.

Correspondence.

THE TEST OF GENIUS.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* of May 24, I find a suggestive article, "Schools for Geniuses." You conclude by saying that, no doubt, there would be considerable difficulty in the way of the teachers at such *Sonderschulen*. True, but let me point out another—if you will, a previous—difficulty, namely: How will you select your pupils? I am strongly inclined to think that the teachers recommending such pupils would be guided by wrong principles. In Germany they would universally be guided by the pupils' *Auffassungsgabe*—that is to say, by his capacity for the acquisition of knowledge, be it of language, or history, or mathematics. In America we should be sure to hear the word *quick* in this connection—that is, the scholar must be quick to perceive and acquire what is presented to him. Now, I submit that these tests do not answer the question to which an answer is desired. For, indeed, which scholar comes nearest being a genius—the one who excels in *Auffassungsgabe*, or (what comes to nearly the same thing) who perceives and acquires quickly, on the one hand; on the other, he who thinks independently, and critically? Undoubtedly, the latter. But then, how will you test his capacity for thinking? There is the rub.

Now, I will here propose a test, which, upon due consideration will be found to serve our purpose. Ask the scholar not about Latin or Greek, or history, or mathematics, but hand him a short list of well-known proverbs, and common sayings, or parables; desire him to select one and express his opinion, concerning the truth or untruth of such saying, its validity and applicability, giving his reasons for such judgment. If at this point it should be objected that the pupil would simply repeat what he had heard others say, the answer is that we can easily guard against this by interposing questions. One more remark concerning the nature of the proverbs or sayings. Be sure to select *easy* ones, and see *how* your young athlete handles the light weight.

How many teachers have tried the plan? I can assure them that they will often

be surprised at the depth of pupils who are not quick.

WERNER A. STILLE.

Hanover, Germany, June 16.

Notes.

Beginning with this issue, the *Nation* will be conducted by Hammond Lamont, for six years managing editor of the *Evening Post*, and Paul Elmer More, literary editor of the same newspaper. The aim will be to hold the *Nation* to the standards and principles with which it has been identified.

It is just six years since we reviewed Mr. John M. Robertson's "Short History of Free Thought, Ancient and Modern" (Putnam's). The title is still retained, though the work has expanded into two volumes in the second edition now before us. A leading defect has thus undoubtedly been repaired, but we cannot pursue the particular changes that have been made.

The Francis D. Tandy Co.'s "Gettysburg Edition" of the supplemented Nicolay and Hay's "Complete Works of Abraham Lincoln" proceeds with vols. v. and vi., and for the first time really justifies its catch-title by printing a facsimile of the Gettysburg speech from the original draft. Lincoln's portraits are evidently now becoming scarce, and the quality of the introductions is not improved by McKinley's having been drawn upon for a formless and platitudinous eulogy.

Of all Edward FitzGerald's works we ourselves return least frequently to his versions from the Spanish stage. They are, as a whole, too sombre and painful, however enlivened here and there by humor and good intercalated verse. Still, one may be glad to have the "Eight Dramas of Calderon" in the original handy Macmillan form. It will save searching in a general collection, and can be comfortably held in the hand.

A new edition of Sir Walter Armstrong's pocket life of Gainsborough has been called for (Dutton), and justly.

Sara Coleridge's translation of the Chevalier Bayard's "Right Joyous and Pleasant History," and the "Travels of Mungo Park," are very acceptable additions to the Newnes-Scribner handy volumes so tasteful in their bindings. The Park has the more open letter-press.

From Messrs. Scribner we receive the sixteenth revised edition of Baedeker's "The Rhine" and the sixth of "Great Britain." Tourists need but the bare announcement.

We can give nothing more to the second edition of Lewis F. Day's "Alphabets, Old and New" (London: Batsford; New York: Scribner's). It is an instructive compendium of examples from all ages and on many materials, together with some recent designs by the author himself and others. Partial alphabets have freely been eked out in the spirit of the extant letters. This will at least save trouble to the craftsman.

Accustomed as we are to the perennial flow from Canon Rawnsley, it still gives one a little shock to receive from his publishers (Glasgow: James MacLehose & Sons; New York: Macmillan) three volumes at once on that favorite garden which he cultivates so incessantly and intensively. Two of them, however, are quickly seen to

be old acquaintances with a new face, viz., "Literary Associations of the English Lakes," over twelve years old. The third is a fresh product of the Canon's ingenuity, "Months at the Lakes"—i. e., a chat for each month in the year, with pleasing photographic illustrations of scenery. Another novelty is that our worshipper of the Lake poets and Lake landscape and commingled associations forbears to drop into verse of his own. This will propitiate some. The texture of the work is quite of a piece with that of its predecessors, and is too well known to call for comment.

With some introductory notice of Milton and of his youthful "Ode on the Morning of Christ's Nativity," by Prof. G. L. Swiggett, the University Press of Sewanee sends out that poem in a little *édition de luxe*, which opens pleasantly in the hand.

The praise which we accorded five years ago, at some length and quite analytically, to Carmichael's "In Tuscany" (London: Murray; New York: Dutton), we will not withhold from the third edition just received. It is a handsome and an entertaining book by a sympathetic and light writer.

"The Highlands and Islands: Painted by William Smith, jr. Described by A. R. Hope Moncreiff" (London: Black; New York: Macmillan) is not a very happy pendant to Mr. Moncreiff's earlier "Bonnie Scotland." It covers the remoter Highlands, West and North, to St. Kilda and the Shetlands, but its forty colored illustrations fail completely to render the glamour of that rain-steeped, sun-swept atmosphere. The subjects tend to the commonplace, and the treatment to the chromo. In part there is a lack in the needed daring—notably in some sun and mountain effects—and in part there is overmuch, as in a Whistleresque Oban Bay at night. Through the letter-press Mr. Moncreiff rambles in his wonted style, feeling, perhaps, some little lack of material. So a chapter is given to a very entertaining onslaught on Dr. Johnson as a Highland traveller, and another to a heart-breaking account of the Sutherland clearing. Such melancholy histories were not for this book, however to be remembered. The cover is very striking.

Professor Vambéry's "Western Culture in Eastern Lands" (E. P. Dutton & Co.) could easily have been reduced to half its length and been a much better book. It essays a defence of the author's known pro-British views through an elaborate statement and comparison of the methods and results of the two "culture-bearers," Russia and England, in Asia, and brings out a very good balance on the English side. His reckoning is probably correct enough, for the very defects of Russian rule in Central Asia are exactly those made very clear as existing in European Russia. Our own political system, as we have discovered, has not been made corruption-proof by transport to the Orient. A less threadbare and more puzzling subject is handled in the third part of the book, which asks what is the cause of the present backward state of the Muslim world, and whether there is any future for Islam. Even in Islam itself Professor Vambéry finds stirrings which will bring about in the future a great awakening and upset many plans. The Ottoman Empire has not known the time of its visitation, but in that empire

is still some hope if its rulers could understand. For the Turk can administer; only his administration is corrupt. It is the tyranny and obscurantism of its rulers that have hindered Islam—not anything in Islam itself. Yet why such rulers were necessarily produced by Islam is not explained; and the conclusion is that, as things are, the still independent Muslim countries will have to give that independence as a price for modern civilization, and can be regenerated only under the protection and direct administration of Western Powers. This means subject races and exploitation, and is, in truth, a hard doctrine. The book is distinguished by Professor Vambéry's usual extraordinary Arabic, and by his quoting as "Koran" all sorts of traditions from Muhammad which never had any connection with the Koran.

The Clarendon Press of Oxford (New York: H. Frowde) has just issued in English translation the second volume of Professor Suess's "Das Antlitz der Erde" ("The Face of the Earth"), dealing principally with the physics of past and present oceanic basins and the all-important geological topics of elevation and subsidence. This excellent translation, for which the student is indebted to Hertha Sollas of Newnham College, Cambridge, and to Prof. W. J. Sollas of Oxford, is fully worthy of the original work, which it now brings directly to the English-speaking geologist, and fittingly supplements the earlier volume, which has already been noticed in these columns. Although the better part of twenty years has elapsed since the appearance of the German work, it still remains the foundation for modern thought in geology.

A more careful obituary notice than ordinary fills the regulation place in the July issue of the *New England Historical and Genealogical Register*. The subject is the late Robert C. Winthrop, jr., a man of great charm of character, but who did not seek the public ways trod by his eminent father, of whom he became the biographer. Lacking the pecuniary incentive to produce, he accepted a "life flowing full without a plan." An English correspondent points out a new and important source of genealogical information soon to be exploited. It proceeds from early seventeenth-century political and religious persecution, the proceedings being held and recorded in the courts of Star Chamber and High Commission. Many of the remonstrants eventually came to this country.

In the *National Geographic Magazine* for June Prof. C. Cobb describes in an interesting way, with illustrations, the chain of islands and fringing sand reefs extending along the North Carolina coast. He explains the growth of the sand dunes, largely through deforesting, by which villages have been buried, and tells how, by planting the seed of the loblolly pine, he changed in twenty years a moving sand waste into a forest. Through this means he believes that the islands could be made subtropical gardens for early fruits and vegetables, and conservative lumbering could be added to the industries of the islanders. These are not "the slothful bankers and rude wreckers pictured in song and story. They are fair women and brave men, most of whom live and do for others—life-savers, heroes." Mr. G. F. Williams, for fifteen

years manager of the De Beers diamond mines, tells of the methods by which the diamonds are won from the "blue ground," and how the affinity of the stones for grease has been used in the invention of an automatic sorter. Professor Jaggard of Harvard University gives a graphic picture, with illustrations, of Mount Vesuvius as it appeared when he ascended it shortly after the eruption in April, and Mr. R. A. Harris outlines, with accompanying charts, a system of co-tidal lines for semi-daily tides throughout the world.

The most interesting part of Weld Blundell's account of his explorations in Abyssinia, in the *Geographical Journal* for June, relates to the gold washing in the Blue Nile and its tributaries. The outfit of the natives is an oblong shallow dish, a sharpened stake, a flat curved scoop like a hockey stick, a small gourd, with a string to fasten over the head and hang behind the ears, for carrying the gold nuggets, and a huge pipe also made of a gourd. The annual amount of gold exported from the principal market is estimated at \$400,000. The industry is traced back to early days. Prof. Scott Elliot advocates a systematic inquiry into the resources of the British Empire through surveys which should ascertain and map the character of the vegetation of the different colonies, and through a catalogue of all the Government documents and valuable literature dealing with them. The paper, when read before the Royal Geographical Society, provoked an animated and suggestive discussion which is given in full. From an examination of standard atlases, school geographies and guidebooks, Mr. R. A. Daly of Ottawa shows the lamentable lack of uniformity and confusion in the nomenclature of the North American Cordillera, between the 47th and 53d parallels of latitude. He prefers Cordillera and, as the best alternative, "The Pacific Mountain System."

"The Territorial Development of the European Colonies," by Dr. A. Supan, editor of *Petermann's Mitteilungen*, has recently been published by J. Perthes. It is noteworthy as being the first attempt to write the world history of colonisation in chronological order. The different periods into which the work is divided are the Spanish-Portuguese, 1492-1598; the Dutch, 1598-1670; the French-English, 1670-1783; the English-American, 1783-1876; the European-American, 1876-1900. The narrative is accompanied by an historical atlas, and there are forty maps in the text.

Professor Rhys's paper on the "Celtic Inscriptions of France and Italy," read before the British Academy on May 23, is to all intents and purposes a continuation of his "Celtæ and Galli," read before the same learned body twelve months ago. It embodies the results of investigations which the Professor undertook on the spot, and covers nearly the whole domain of the Celtic inscriptions of the Continent. He has examined about forty in all, some a mere name, some (e. g., the Coligny Calendar and the Rom "defixiones") containing a fair number of words. The collation of these latter with previous readings (those of Dissard for the first, of Jullian for the second) has brought to light some inaccuracies, but none of such importance as to upset his interpretation in the main, or to lead him to believe with D'Arbois de

Jubainville that the documents are Ligurian rather than Celtic.

We lately received a copy of the Inaugural Lecture of H. E. Egerton, the Oxford professor of Colonial History (H. Frowde). The chair, which he is the first to fill, was founded not long since by Mr. Beit, and would seem to be the logical complement of the scheme of the Rhodes trustees. His lucid address was a statement of the claims of the study of Colonial History in the University of Oxford. He urges it not so much for the sake of research, as for its bearing on current questions, *c. g.*, compulsory arbitration, the legal minimum wage, Chinese labor, and tariff reform.

—Edmund Gosse contributes to the *Atlantic* a fifteen-page appreciation of Ibsen, whom he couples with Nietzsche as representing pure intelligence in its proudest and most independent form among men of the second half of the nineteenth century. Sprung from an impoverished and remote civilization, dwelling among a people "suffering from that radical inaptitude for receiving the truth which comes from knowing too much and yet not enough," he was like a man in a lunatic asylum devoting his whole energy to the task of keeping his own sanity intact in the midst of a world of illusion and absurdity. Mr. Gosse finds in him many affinities with Euripides, "the agitator of the people," as interpreted by Dr. Verrall, and surmises that his attitude of bitter revolt, in some of its manifestations, would have presented matchless opportunities for ridicule if Christiania in the seventies had had an Aristophanes among the defenders of the old ideas. The determinist, it is suggested, may well find reason to question the sufficiency of his formula in the character of Ibsen, turning doubt and despondency into the props of his youth, according to his own declaration, and developing not in conformity with, but in unceasing resistance to, the motives acting upon him. The failure of the two great Anglo-Saxon countries to assume towards Ibsen the attitude of appreciation long since manifested by other civilized communities, Mr. Gosse assigns to two causes: one that his moral anger cannot be understood by those who have grown up under the influence of the dominant Anglo-Saxon optimism, and the other that we tolerate the stage only as a place of physical amusement and hence do not realize that anything seen at the play, or written for it, can be serious or intellectual.

—The aim of *Scribner's* this month is to entertain rather than instruct or convince, the one noticeable exception being a paper on Glasgow by Frederick C. Howe, who seeks, of course, to turn the successfully managed municipal industries of the Scotch city into an argument for similar methods in American cities. Here, as in his recent book, Mr. Howe presumes too much on his belief that the exorbitant profits of public service franchises in private hands constitute the only seriously important corrupting force in city government. The leading illustrated articles of the number are by Ernest C. Peixotto and Edward Penfield, the former dealing in a general way with Dalmatia and the latter selecting a little village of Holland for more intimate presentation. In his references to the earlier history of Dalmatia Mr. Peix-

otto passes over one point not unworthy of mention in such an article, the fact that it was in a campaign against the Dalmatians that Asinius Pollio accumulated the fortune which enabled him to open a library to the public in Rome and to set himself up thereafter as a liberal patron of letters and literary men. The third paper in the "Railways of the Future" series describes the projected transcontinental system of Canada. Friends of "Bob and the Guides" will read "The Perfect Tribute," by Mary R. S. Andrews, with some surprise. One cannot avoid a strong desire to know just how much historic basis there is for the minute details of the Lincoln incident which she relates.

—In the *July Century*, John L. Cowan describes a method of soil-culture destined to play perhaps as great a part as irrigation in the development of the semi-arid regions of the West. "Dry farming," as it is called, consists in such mechanical preparation of the soil as will hold and utilize the small amount of rain which does fall. With implements specially adapted to the work, the sub-soil is finely pulverized and firmly compacted, thus becoming a good bed for the retention of moisture. The surface soil, on the other hand, is kept finely pulverized and loose, acting as a kind of mulch to let the rain and melting snow through to the sub-soil easily, and retain it there. This preparation is, of course, excellent for the roots of growing crops, aside from its special relation to the dry climate, and extensive experiments have shown that regions with an annual rainfall of not more than twelve inches have produced as bounteous crops under this system as with irrigation. Professor Bailey, of the Cornell College of Agriculture, applies the statistical method on a small scale to the question, Why boys leave the farm, presenting tabulated replies to inquiries submitted to students from farming communities in Cornell University. The substance of these replies may be simmered down to the two objections, that farm life is dull, and offers no road to great financial success. Of genuine literary interest is a paper by Julia Scott Vrooman on the friendship between Robert Louis Stevenson and Jules Simoneau, the old restaurant-keeper of Monterey, who kindly allowed liberal extracts to be made from his rich treasure of Stevenson letters. Perhaps the most piquant quotation is a balancing of the English, "hypocrites, good stout, reliable friends, dishonest to the root, and fairly decent to women," over against the French, "free from hypocrisy, incapable of friendship, fairly honest, and rather indecent to women."

—Mr. Howells is never an inconsiderable part of a number of *Harper's*, but an appreciation by Mark Twain, in addition to the usual twofold contribution from his own pen, makes him inevitably the leading feature of the July number. For forty years Mr. Clemens has found his English a continual delight and astonishment, notable for its clearness, compression, verbal exactness, and seemingly unconscious felicity of phrasing. The attempt to rewrite a passage of Howells and reproduce its compactness he compares to the case of a man whose trunk has been packed by a woman; he can get the things out of it,

but he can never put them all back. Naturally, the reader looks for his opinion of Mr. Howells as a humorist: "I do not think any one else can play with humorous fancies so gracefully and delicately and deliciously as he does. . . . His is a humor which flows softly all around, about, and over and through the mesh of the page, pervasive, refreshing, and health-giving, and makes no more show and no more noise than does the circulation of the blood." In those artifices which authors are forced to employ to give a natural setting to a scene or conversation, he finds in Howells a pleasing contrast to writers who overdo their "stage directions," and "spend so much time and take up so much room in telling us how a person said a thing and how he looked and acted when he said it, that we get tired and vexed and wish he hadn't said it at all." Mr. Howells's English paper for the month deals with Bradford-on-Avon, with its eighth-century Saxon chapel and its old stone cottages, handing down from generation to generation an inheritance of colds in the head as unbroken as their other traditional appurtenances. "How rheumatism must run riot among the joints of age in the very beds and chimney-corners! Better, it sometimes seemed, the greatest ugliness ever devised by a Yankee carpenter in dry and comfortable wood than the deadly beauty of such dwellings." The *Easy Chair* satirizes in its own way the recent attempt to prescribe a certain manner of dress as a prerequisite to appearance at the dining-table of a New York innkeeper.

Among the theatrical novelties promised for next season there are few which will be awaited with more hopeful expectation than "The Hypocrites," the new comedy by Henry Arthur Jones, which will be presented in the Hudson Theatre in this city early in September. For some reason or other Mr. Jones has been treated with scant justice by many contemporary critics, who have been more eager to dwell upon his defects—his tendency to preach, dogmatize, or exaggerate, for instance—than to recognize his many excellences as a potent satirist, a good story-teller, and a composer of humorous or witty dialogue. His latest piece is reputed to be a companion play to "The Liars," which is one of the cleverest comedies of modern times.

A discussion has been started in some of the English newspapers as to whether the British public is or is not prejudiced against American plays. The excuse for it is the comparative failure of "The Lion and the Mouse," which has been so successful in this city. Of course, the public here, there, or anywhere else, cares nothing about the nationality of any play. It is governed entirely by the impression of the moment. Plenty of American plays and players have succeeded in England; and plenty of English plays, including some very poor specimens, have been exceedingly prosperous here. About the cool reception extended to "The Lion and the Mouse" and "Shore Acres" there is very little mystery. The former dealt with conditions, types, and interests perfectly familiar to American audiences, but little known, and therefore, in a measure, insignificant, in London, while the play itself, apart from its main purpose and subject,

was not a particularly good one. In its earlier scenes, indeed, it was both lame and feeble. As for "Shore Acres," it was so deformed and transfigured that it might, with almost as much propriety, have been called a Dutch play as an American.

George Alexander has assigned all his American and Canadian rights in Stephen Phillips's "Paolo and Francesca" to H. B. Irving. It seems probable, therefore, that Mr. Irving will include that piece in his repertory when he comes to this country next fall.

Paul Souchon's pastoral play, "Le Dieu Nouveau," which has just been produced at Champigny, in France, appears to be a strange composition. A brief synopsis of it is as follows: The gods of Olympus have been hunted out of Hellas, and have taken refuge in Provence. Some shepherds have seen them there, and Apollo with the nine muses is in a smiling valley near the little white town of Arles. Apollo appeals to the shepherds to protect them against the new God, the God of the Nazarenes, and against his doctrine, which is, says Apollo, destructive of joy, liberty, and love. But Lazarus and Magdalen come to Provence and hound the Gods out of Arles again. The people of Arles take the part of the shepherds, and Apollo would have lost his life but for the appeal for mercy which Magdalen makes for him. Conquered by the new God, Apollo disappears into exile, and waits for his revenge.

After a career of thirty years as an operatic tenor, Hermann Winkelmann had farewells to the stage a few weeks ago at Vienna, where he had been a member of the Imperial Opera for twenty-three years. His numerous admirers prepared a great ovation for him, and in thanking them he promised to reappear occasionally in the concert hall—a foolish promise, for if his voice is no longer good enough for opera, it certainly cannot be satisfactory on the concert stage, where he will lack the accessories which enable an operatic tenor to atone in part for vocal shortcomings by excellent acting. Americans who have heard Winkelmann in recent years say that he usually sang atrociously in the first act of an opera, better in the second, and superbly in the third, when his vocal cords were, so to speak, thoroughly limbered.

Like Alhert Niemann (who is still living) Winkelmann has been renowned for his histrionic gifts quite as much as for his singing. Wagner chose him to impersonate Parsifal when his last opera was first performed at Bayreuth. Other Wagner rôles in which he has been famous are Tannhäuser, Lohengrin, Siegfried, Siegmund, Rienzi, and Tristan. He also has had few equals as Florestan in Beethoven's opera, and as the Prophet, Otello, and Merlin in the operas of Meyerbeer, Verdi, and Goldmark. His birthplace was Braunschweig. He was "discovered" by a writer, Hugo Wittmann, who persuaded him to cultivate his fine voice. After singing for some years at Hamburg and elsewhere he made his home in Vienna, where he became the idol of a special cult. There was also a Reichmann cult, and whenever both the tenor and the haritone appeared in the same opera there was sure to be abundant applause, as each coterie, tried to outdo the other. New Yorkers had a chance to hear Winkelmann

when Theodor Thomas brought him over, with Materna and Saria, for his great Wagner Festival.

When Edvard Grieg was made a Mus. Doc. at Oxford, the other day, one of England's leading musicians, Sir Hubert Parry, made a Latin speech, in course of which he said: "How great and how individual the beauty of his songs! The force and grace of expression, the sweetness of sound, the exquisiteness of their representation touch the innermost chords of the human heart, and by merely touching them make men stronger and better. There is no lyric hard who has to such an extent won at once the admiration of the critic and the love of the public." Let anyone who doubts, get volume iv. of the Grieg Album in the Peters edition, and see for himself. The eight songs in this volume were written by Grieg in ten days, at a white heat of inspiration, to words by the peasant-poet Vinje. No set of songs quite equal to this has ever been created except Schubert's "Winter-journey," the musical "Book of Joh." Of indescribable charm also are Grieg's "Ragna" and "Ragnhild," which he had on his second London programme—simple as folksongs, yet every har a bar of gold.

Regarding the causes which led to Mozart's early death, a number of interesting details are given in a recent number of the Paris *Revue Médicale*, which is printing a series of articles in which the maladies of famous men of the past are studied in the light of modern medical science. On the strength of the death certificate, it is commonly assumed that Mozart died of inflammation of the membranes of the brain. Dr. J. Barraud of Bordeaux, however, shows conclusively that what he succumbed to was Bright's disease. As a boy of six, Mozart, though healthy, was delicate and very nervous; he would almost faint at the sound of a trumpet. At the same age he had scarlet fever, and three years later, typhoid, with a relapse. During the time he ought to have devoted to convalescence, he worked hard, writing six symphonies and as many sonatas. In 1767, he had smallpox in a virulent form; during nine days he was almost blind. In 1781 he was again weakened by a persistent attack of influenza. The body which he brought to the great tasks of the last years of his life was so feeble that he fainted on the slightest provocation and had to take to his bed. Poverty compelled him to add overwork to the causes which undermined his health. When the success of "The Magic Flute" promised to improve his financial resources it was too late; the mischief was done; any slight accident upset his brain. Hallucinations were frequent during the last month of his life; his hands and feet were swollen, and he was pitifully pale and emaciated. Dr. Barraud thus sums up the case: "Overwork, constant feeling of exhaustion, direst distress. Mozart is used up at the age of thirty-five; all his vital force is gone, and now he is seized by the disease which carries him off; rapid loss of strength, attacks of suffocation and swooning, swelling of the extremities—if that is not Bright's disease then there is no such malady."

The late W. G. Hurlstone of London is spoken of as "one who regarded music

as an art to live for rather than to live by"; which would make a fine epitaph for any musician.

BENSON'S PATER.

Walter Pater. By A. C. Benson. (English Men of Letters Series.) New York: The Macmillan Co. 75 cents net.

Mr. Benson's Pater, like his Rossetti and his FitzGerald, is one of the better of the rather uneven new additions to the useful Men of Letters Series. It is not quite an ideal biography. The ordonnance of the material is a little casual, and it was a mistake, we believe, to present an abstract of every one of Pater's essays. The texture of style, charming in the main, lacks, nevertheless, the entire *ordo concatenatioque veri*, and is a little loose and repetitious, as of a talented writer composing in too great haste with other irons in the fire. The reader does not feel that the heart of Pater's mystery is finally plucked out. Yet as a whole the volume is a most agreeable piece of writing and is generally adequate both on the personal and on the critical side.

The singular inwardness of Pater's life is shown anew in the fact that while Mr. Benson has consulted all of his author's surviving friends and relatives—he gives a formidable list of them in his preface—he has discovered no new incidents of importance in the development of that composed, self-centred career, and has adduced few hints of temperament and intimations of character beyond those already cited by Mr. Gosse, Mr. Sharp, and other writers. Nevertheless, there is a touch of fresh picturesqueness in Mr. Benson's pen portrait of Pater, and it has several marks of distinction from those of other writers who have found it hard to refrain from trying to make him look the part of the Cyrenaic. Mr. Benson concedes him the "Japanese" look, the complexion as of old ivory, the air of world-wearied languor which have always figured in accounts of his person, and he grants that "he had a slight stoop, and dragged one foot slightly, advancing with a certain delicacy." But he calls to mind that he was "broad-shouldered, strongly built, sturdy, and gave the impression of soundness and toughness of constitution," and that his "low, deferential voice, his shy smile, the delicate phrasing of his sentences, and his obvious interest in the temperament of his companion gave the feeling of great and sincere humility."

Of the few fresh anecdotes which Mr. Benson has collected, one or two are of some significance. Thus, we are told that Pater once said: "I admire Poe's originality and imagination, but I cannot read him in the original, he is so rough; I read him in Baudelaire's translation." And that singular love of ceremony which was the life-long trait of the author of "Marius" comes out vividly in Mr. Benson's account of the delight which Pater had in his office of Dean, a purely honorary post, having as its only duty the presenting of men for their degrees, but giving the holder a dignified stall, "that on the extreme right on the decani side, next to the altar—the stall dignified by an especial canopy and an exalted desk." "Sitting in this stall," says Mr. Benson, "his large, pale face, his heavy moustache and firm chin, his stoop, his

eyes cast down on his book in a veritable *custodia oculorum*—all this was deeply impressive, and truly revealed the solemn preoccupation which he felt." He never failed to occupy his stall, we are told, both on Sunday morning and evening, and he was a strong advocate of the Sunday services being compulsory.

Of the personal isolation of Pater, Mr. Benson says pointedly: "He could be kind, courteous, considerate, and sincere; but he could not be intimate; he always guarded his innermost heart"; and Benson is the first writer on Pater to point out clearly and definitely what many of his friends were sorrowfully aware of, that while this peculiar isolation was at root a temperamental matter, it was in large measure fostered by a discordant environment. Pater had fallen on evil days.

"Oxford itself," says Mr. Benson, "which should have been the home of intellectual and artistic speculation, was crowded by a younger generation whose idea of a university was a place where, among social and athletic delights, it was possible to defer for a time the necessity of adopting practical life. The older men, those who were accepted by the academical world as men of leading, were too often men of bur-sarial minds who loved business and organization better than intellectual freedom. Even the keener spirits, both among the younger and older men, were of a dry and rigid type, believing in accuracy more than in ideas, in definite cumulation more than in intellectual enjoyment. In this atmosphere, Pater felt himself misunderstood and decried."

If Mr. Benson has added little that is startling to the criticism of Pater as a writer, he has, nevertheless, phrased his quality with a curious felicity. Take this, of his style:

Indeed, the writing of Pater may best be compared to the opal. It has not the clear facets, the limpid color of the unclouded gem; but it is iridescent, rounded, shot with flashing lights, and suffused with a milky mist, of which one can hardly say whether it be near or far. It is this strange sense of depth, so inherent in a cloudy gem, that it gives one. One can measure to a millimetre the actual bulk of the jewel; but within that limit what spent lights gleam, what misty textures roll! It is like a little colored eye-hole through which one can discern the orbits of pale stars, the swimming vapors of some uncreated world.

In its perfect and ornate expressiveness, this, save perhaps for the "little colored eye-hole," might have been written by the *parfait prosateur* himself. Indeed, like nearly all except the most unsympathetic writers who have had their say of Pater, Mr. Benson seems to experience some difficulty in freeing his mind from the echo of the Paterian cadence. Once, in the elaborate and not quite tactful passage in which he panegyricizes Pater's love of cats, Mr. Benson pays, it seems to us, the penalty of discipleship, but in the main his humor as well as his critical sense preserves him. Perhaps the most suggestive and satisfying bit of criticism in the book is that in which he points out the frequent humor of Pater's writing—a humor so delicate, so mournfully disguised, that it has escaped the notice of some of the most attentive readers, and caused those who have ventured to assert its presence to be regarded as fantastic and paradoxical persons.

It is the kind of humor (says Mr. Ben-

son) that one may sometimes discern in the glance of a sympathetic friend when some mirth-provoking incident occurs at a solemn ceremony at which it is essential to preserve a dignity of deportment. At such moments a look of silent and rapturous appreciation may pass between two kindred spirits; such in its fineness and secrecy is the humor of Pater's writing, and presupposes a sympathetic understanding between writer and reader.

The burden of Mr. Benson's interpretation of Pater is the reiteration of the truth that has been many times stated of late—that Pater was far from being the sbad-owy aesthete that he so long appeared to downright persons, the Mr. Rose of Mallock's parody, living, in the suppressed phrase of his own, in a "medicated air," concerning himself about "remote and unaccustomed beauty, somnambulistic, frail, androgynous." But though Mr. Benson is wholly successful in painting the delicacy and devotion of Pater's temperament and the fundamental austerity of his mind, we do not derive from him a wholly satisfactory understanding of the inner spirit of that "new Cyrenaicism" which was, when all the evidence is considered, the true reflection of Pater's personality. This, no doubt, is because Mr. Benson quite rightly sees how much there is in the world other than new Cyrenaicism. But he would, we think, have been a truer interpreter of Pater if he had contrasted less and compared and expounded more. New Cyrenaicism, as it is taught in the "Renaissance" and in "Marius," is more than a mere æsthetic philosophy of life which might have found its arch saint in Benvenuto Cellini and its fallen angel in Dorian Gray. It was, as Mr. Benson capably points out, a synthesis of piety, humanistic scholarship, and the most delicate artistic appreciation in the deep imagination of a dreamer forever busied in reconstructing "with lucid purity of soul" the evanescent dreams, the abiding visions, of other dreamers and embodyers of dream in old forgotten ages of the world. So far, Mr. Benson is an excellent guide. It is only when he would introduce us to the cool, inscrutably smiling figure of Pater himself that we fail to be sure that he has a perfect comprehension of the quality and source of that elaborate, yet, as it were, passionate, serenity which was the chief trait of Pater as a man and as a critic of letters and art and life.

TWO NOVELS.

Fenwick's Career. By Mrs. Humphry Ward. Harper & Bros.

The Bridal of Anstace. By Elizabeth Godfrey. John Lane.

If a novel is to go off well there must be something likeable about the principal character. It is not in the nature of man to sympathize with the brother whom he can't like, or even to take more than a perfunctory interest in a narrative of his ups and downs. There is nothing to like in Mrs. Ward's "John Fenwick," and therefore we are not moved from indifference by the well-told story of his misfortunes and wrongs, his success and failure. The best reason that can be given for not liking him is that his strong instincts are wrong. He makes a great show of despising popular success in his art (the art of painting),

yet that is what he craves and instinctively works for. He dislikes men who openly bid for and win what he secretly covets, and hates men whose social experience and accomplishment are greater than his own. After his wife takes revenge for his practical denial of her existence he instinctively blames her for the rupture, and for many years (when he happens to think of her) is filled with "fierce and inextinguishable resentment." His friendship for Mme. de Pastourelle is thoroughly egotistical, resting always on what he thinks she can, may, or will do for him. From the beginning he is easily seen through, and hope of pleasant surprises diminishes as his career unfolds.

It does not appear probable that his wife's abandonment of him had the baleful effects which Mrs. Ward would have us believe. Indeed, she seems to us to have espoused the wrong side in the quarrel. The most that can be truthfully said of Mrs. Fenwick's conduct is that it was hasty, when great caution was important. At the moment when she found Mme. de Pastourelle's portrait in her husband's studio and her letters on his table, she is described as being in "an abnormal state, the victim of morbid processes of brain developed in her by solitude and wounded love and mortified vanity." It would be fairer to say that she was angry, naturally and justifiably angry, finding as she did what seemed to be excellent evidence of the faithlessness of a husband from whom she had already suffered (with indifferent patience) neglect that almost amounted to desertion. At this critical juncture the author exclaims: "One hour with him—one hour of love, scolding, tears—would have saved them both!" We cannot share her hopefulness. Fenwick had just been paid for two pictures, and had gone off to talk about his success to fellow-artists. It was his pious intention to go down to Westmoreland the next morning and share his good luck with his family. Supposing that he had returned to his studio and found his wife in a fine rage, nothing that the author has told about him justifies her beatific vision. It is more likely that, during the hour, he would have decided that he needed his money for a higher purpose than the support of his wife and child, and that Phoebe would have been packed off by an early train to enjoy a further period of seclusion in her native hills.

By espousing what seems to us the wrong side, the author has contrived to make a good ending. After twelve years of exile in Canada, Phoebe comes home, sensible of error, humble and suppliant, and her passionate eagerness to win back her husband supplies some emotional moments. As an entertaining picture of artists and their lives, wherein these differ from more equable people pursuing humdrum professions, the book cannot be commended. There is plenty of the temperamental irritability ascribed to artists, but no compensating temperamental gayety. Fenwick's musings about art and the "shop" talk are stiff and formal, rarely spontaneous. Mrs. Ward is more fluent and plausible in the discussion of politics or current questions. It is only in construction that "Fenwick's Career" seems to us better than her preceding novels.

Miss Godfrey's new novel opens instead of ends with a marriage ceremony. An

English girl is wedded to an Asiatic Greek count—more specifically, belonging “to one of the old archontic families of the Fanar”—whose proud boast was “that the blood of the Paleologus” ran in his veins. The bride has accepted his religion with himself, and is about to be wafted with him on his yacht to live on an isle in the Ægean, among orange trees and ilex-bordered terraces. A terrible collapse occurs—nothing less than the disappearance of the bridegroom while the carriage waits at the door. Nor does he loom in sight again till the three-hundredth page. In the meantime, Anstace flees to a remote point on the English coast, where she hopes to find calm and privacy with an old nurse, married to a coast-guard officer. The year she spends in this wild, lovable region goes far toward making the reader forget the lost bridegroom. Here, beside the coast-guard folk, lived the Stonedge quarrymen, “a race apart, marrying only in their own community, keeping their own trade and trade-customs, and regarding every stranger as an intruder.” “Not only no stranger, but no base-born man may even work in [the quarries], far less own them, and this has made them descend from father to son in a kind of perpetual entail.” Some kindly souls there were in this clannish community to be hospitable to the unhappy refugee. By their distinctness they might be called village types, if that hackneyed name did not suggest hackneyed folk, whereas the men and women of Stonedge were ruggedly original.

Presently Anstace finds her intellectual level with the clergy and gentry of the region. She enters upon the enjoyment of their wonderful libraries and their collections of rare Greek manuscripts, makes catalogues and teaches the Romaic fashion of pronouncing; she learns their histories, too, and finds that all like herself have their private griefs. Thus she is slowly attuned to the great world-symphony of suffering, and learns to play her own little pipe with courage. Then comes the dénouement, bringing no conventional joy for her, but, instead, the peace of understanding, and she finds that, after long torture, to understand is to be almost happy. That for the reader there may be some weak points in the explanation is possibly only a tribute to its reality. There usually is a weak point in an explanation, and frequently more than one in the person who has to explain. As mysteries and solutions go, these will pass, and they have the advantage of a certain amount of originality. The book would be well worth while even if it had been written solely to picture the life of Anstace among the “Ancient Company of Marblers,” wandering over their beautiful downs, learning their superstitions, seeing their ghosts. The Greek element is effective, but its fires flare now and then. At such moments its smoke is less of the torch than of the midnight oil. Just the least little suppression of its fumes, just the least touch more of the concealing art, and there need not be a sense of a story growing up around a study. Manners, customs, and pronunciations come in with the breath of research in their garments. But these easily-seen inequalities do not prevail over the fine and interesting features of the story. In construction and in omission, it is the most masterly novel Miss Godfrey has yet written.

Life in the Open: Sport with Rod, Gun, Horse and Hound in Southern California. By Charles Frederick Holder. New York: G. P. Putnam's Sons. \$3.50 net.

The Log of a Sea Angler: Sport and Adventures in Many Seas, with Spear and Rod. By Charles Frederick Holder. Boston: Houghton, Mifflin & Co. \$1.50 net.

Mr. Holder has long been one of the most prolific of sportsman-naturalist writers, but two such books as we have before us at a time is a “double” somewhat beyond the ordinary, even for him. “Life in the Open,” with its wide margins, large type, superior paper, abundant inset illustrations and appropriately decorated binding, is a volume which will take hold of the book-lover at once, regardless of contents; but it would be a pretty exacting reader who could feel any material disappointment after its perusal. Mr. Holder is well known to sportsmen as the original demonstrator of the fact that the leaping tuna of Southern California waters can be taken with rod and reel with a sufficient percentage of success to make the effort a fine sport for the expert angler. His organization of the famous Tuna Club followed this demonstration, and through its influence not only has tuna fishing been rescued from the unsportsmanlike and wasteful methods which formerly attended it, but the movement for the ethical elevation of sport in general has also received additional impetus. The reader of his books may feel assured from the start that he will be spared such disgusting details of enormous catches as disfigured much of the literature of angling in a not remote past. Paradoxical as it may seem to the uninformed, the most intelligent devotees of the rod and gun are to-day taking place as the most persistent and effective advocates of every rational movement to preserve our native fishes, birds, and wild animals from extinction. Let the zest for gentlemanly sport of this nature die out, and the “fish-hog,” pot hunter, and milliner would go their old way rejoicing.

Mr. Holder's appreciative pores are open to every phase of nature and life in California. It is not only a good winter resort, but a good place for the summer as well, and he expresses hearty approval of the man who long years ago dropped into a Southern California town for a day's sojourn, vowed within a few hours that he would never leave it, telegraphed for his family, and now, in the ninth decade of his life, is still “growing up with the country.” There are paragraphs in his book, as in the chapter on “Life in the Sierra Madre,” which are strongly suggestive of the nature-writing of John C. Van Dyke, in such volumes as “The Desert” and “The Opal Sea.” We do not mean to suggest imitation, or even unconscious influence of the one writer upon the other. The similarity is doubtless due to a certain likeness in the mental attitude of the two men towards the phenomena of nature. It would take more than internal evidence to show that the devotee of the rod, and not of the brush, penned the following sentences:

I have stood on the high peaks at night and watched the fog come stealing in from the sea, until it spread out, an opaline vestment, filling all the valleys with seas of silver, through which the tops of hills and lesser mountains protruded like islands; an sea of marvellous lights and shades. In

early morning it is vermilion or violet or silver, a splendid spectacle, as though the very air had frozen and filled the lowlands with a rolling, billowy sea of ice that stretched away to the horizon and wound its way around the limitless world.

Of course, it is easy for such nature descriptions to slip insensibly into a mere habit of the pen, only indirectly the product of real feeling and incapable of begetting real feeling in the reader. Mr. Holder's shooting-stars and Mariposa lilies bloom together often enough to arouse a disquieting suggestion of the literary bouquet-maker, but on the whole the scent of the real blossoms is conveyed to his pages with noteworthy success.

We have suggested points at which the nature vision of Mr. Holder coincides with that of the art critic, John C. Van Dyke. Readers of the remarkable volume on “The Desert” will recall that Mr. Van Dyke's eye is open to certain moods and phases of Nature so sombre and heartless, so relentless in her carelessness of such a petty thing as man's fleeting interests and feelings, as to be profoundly depressing to the reflective mind. Whether from temperament or from conscious choice, Mr. Holder paints the outer world to us almost exclusively in its brighter and more optimistic phases. Henry Van Dyke could not go over Mr. Holder's pleasure haunts without adding to his literary record scores of sharply individualized pictures of human character, as definitely and lovingly presented to the mind of the reader as any of his sketches of lake or woodland or “little river.” Mr. Holder's guides and companions are too vague in their outlines to stick fast in our memory as personal acquaintances, though in some of his chapters, especially in “The Log of a Sea-Angler,” their successful characterization would add materially to the desired effect.

When it comes to his tales of fishing and hunting, the critic finds Mr. Holder somewhat of a puzzle. One feels wholly unwilling to classify him along with “the tribe of Ananias and Sapphira,” a tribe much given to fishing and hunting, and yet the details of his long and remarkably comprehensive experience with gun and rod do make very heavy drafts upon the bank of human probability. We recall an old friend whose carefully chosen tackle appeared in the window of the village hardware store for sale. An exclamation of surprise brought from a store-box philosopher the remark, “Oh yes, he's resolved to put away his rod and gun and henceforth to lead a better life.” Perhaps, however, we ought not to bring an angler's interpretation of his experiences to the clumsy standards certified by the official sealer of weights and measures. He is no grocer, or carpenter, but an artist, of the school of impressionism. How his captured tuna would balance against a bushel of coal in the opposite scale-pan is not the question, but how it balanced at one end of his nicely adjusted tackle, against his own high-strung, nervous and muscular organization at the other. From this and not the basely material point of view we may read without being disturbed the story of Mr. Holder's record black sea-bass, a monster that in thirty minutes' fighting had drawn full seven hundred feet of line from a reel which, according to his express statement

but three paragraphs back, had but about six hundred feet on it when the lure was tossed into the water. It is one of the most indubitable proofs of Mr. Holder's possession of the true spirit of the angler that, "inch for inch and pound for pound, the gamest fish that swims" (Dr. Henshall invented the formula, if we remember rightly) is found in many waters and under various forms and names. The power to eliminate every other possible consideration by the joy immediately in hand, when a game fish is actually on your line, is the *ne plus ultra* of the angler's bliss, and, of course, removes all limit to the possible number of gamest fish or most exciting captures.

On the naturalist side, Mr. Holder shows some of the marks of the "new school." If we are to take his words, in various passages, at their face value, the fish that cuts the line against a projection of coral, tangles it in the weeds and then jerks loose because of the unyielding resistance thus secured, or springs into the air and throws the hook from its mouth by a muscular rebound from a suddenly assumed curve, is acting on a rational plan, as definitely conceived as that of a man who removes a fish-hook from his finger by cutting the line and drawing the shank of the hook on through the wound, to prevent the laceration incident to drawing the beard backward. All this takes no account of the fact that the first fish hooked in a virgin lake or stream, where no experience with contrivances of the kind has been possible, either to that particular fish or its ancestors, will go through exactly the same manoeuvres as one of the same species in frequently fished water. The characteristic shake, we might almost say *shudder*, of a small-mouthed black bass, as it springs into the air with a hook in its mouth, is too natural a reflex effect of the sudden pain and nervous shock experienced to need any explanation which lugs in the advanced mental processes of the civilized human being. However, the gross amount of this new-fangled animal-psychology of the story writers is too small to be regarded as a serious drawback to Mr. Holder's books. All in all, we shall be surprised if the present season brings forth any comparable offering in the way of outdoor literature.

The Heart of the Railroad Problem: The History of Railway Discrimination in the United States, the Chief Efforts at Control, and the Remedies Proposed; with Hints from Other Countries. By Prof. Frank Parsons, Ph.D. Boston: Little, Brown & Co. \$1.50 net.

Some years ago, when the mania for serial biographies was at its height, a magazine publisher is said to have rejected a proffered manuscript with the remark, "What I want is a *snappy* life of Christ." The quality which the publisher required is very much in evidence in Professor Parsons's book. The volume is before everything else a "snappy" indictment of the railroads. Its thesis is, that "our railway practice is a tissue of unjust discrimination, denying the small man equal opportunity with the rich and influential." That there is very substantial ground for this charge is undeniable, but the author pursues his quest in curiously discursive

fashion symptomatic of *la courte haleine*. Instead of assembling his counts under three or four main heads, he meanders through more than thirty chapters, each devoted to some phase of railroad iniquity. Again and again he recrosses his own argumentative trail. Thus, chapter 14, on Locality Discrimination, chapter 27, on The Long-Haul Anomaly, and chapter 28, on Other Place Discriminations, all treat of essentially the same theme. Chapter 13, entitled Imports and Exports, duplicates chapter 29, on Nullifying the Protective Tariff. In chapter 30, his "assortment of favoritisms" numbers over sixty separate offences. Browning's

Twenty-nine distinct damnations,
One sure if another fails,

is simply nowhere by comparison.

The average chapter is short, and rather more readable than the usual assault upon common carriers. Interviews and fragments of testimony, both questions and answers, are interspersed in the text. Occasionally a happy phrase throws a gleam of humor upon the discussion. Thus, on page 76, Professor Parsons remarks: "Aside from these sudden fainting spells of the oil tariff at convenient seasons for the Standard, the ordinary arrangements showed thoughtful care for its comfort." The author has an extensive knowledge of concrete facts about railroads. He has interviewed many railroad officials, and has travelled widely in quest of information. But no one will ever charge him with an undue tendency towards discrimination. He does not adequately sift the instances he cites. He does not always cross-examine his facts. An ex-parte statement, as on page 56, is as good as a court decision if it tends to help his case. He habitually underestimates or minimizes the influence inevitably exerted on rates by water transportation. A tyro could explain the disparity in the rates between New York and Ogden, and between New York and San Francisco (p. 25). Occasionally Professor Parsons falls into downright error. Thus, on page 232, he asserts that the Interstate Commerce Commission "has not been overruled in respect to questions of fact, but on the application of what it believed to be law." And yet in the San Bernardino case the Circuit Court declared the facts "to be widely different from those set out in the report of the Commission."

Professor Parsons evinces no very thorough grasp of the theory of transportation. He has never taken to heart the adage, *non multa, sed multum*. He evidently inclines to a gradual realization of the postal principle of uniform charges irrespective of distance as the rule for railroad rates. Thus, on page 293, he remarks: "The equalization of rates through application of the principle to one commodity after another, or the gradual extension of zone distances in a zone tariff, offers the only hope of attaining a really just and scientific system of rates."

The sanest, most judicious part of the book sounds a warning against entertaining extravagant hopes that discrimination will practically cease if the power to set maximum rates is conferred on the Interstate Commerce Commission. Twenty-two States have given their respective commissions certain powers of fixing rates on intra-State traffic. "In none of the States does

the power to regulate rates appear to have produced results of much value" (p. 255, note). Many kinds of discrimination, as Professor Parsons shows, will hardly be removed even if pooling is legalized. As an opportunist policy the author supports the Hepburn bill, but he looks forward with hope to the eventual nationalization of our railroads.

The book is a readable collection of single instances of railroad enormities. In the hands of one acquainted with the essentials of transportation, it may prove of service; in the hands of a novice, it is likely to engender prejudice and disseminate error.

The Dynamics of Living Matter. By Jaques Loeb. Columbia University Press. New York: The Macmillan Co. \$3.

Chemistry of the Proteids. By Gustav Mann. Macmillan. \$3.25.

It is needless to say that no living wight comprehends even the outlines of the dynamics of living matter or the chemistry of any protoplasmic body. But it is an intensely interesting thing to see with what resistless march science seems to be now approaching the final investment of the two strongholds, of which the latter must be the key to the former. The attack upon that may be said to be the highest enterprise that man has ever undertaken with any reasonable prospect of success. The body of a living being is a chemical "works" of stupendous complexity, whose operations are of a most delicate nature. One could not, thirty years ago, have ventured even upon that statement without fear of contradiction; but it is now plain that it is a problem of chemistry, in which other sciences have to be considered about in the same proportion that they must be in explaining the manufacture of sulphuric acid.

In his "Concluding Remarks," Professor Loeb declares that the goal of biology is "experimental abiogenesis." He doubtless thought the time had not come to pick one's words upon such a point, but in any sense in which such a feat could be the goal of biology, it must include a practical understanding of the chemical constitution of albumens and nucleic acids. These are all optically active bodies, twisting the rays of light which pass through them, albumens to the left, nucleic acids to the right. At present, we can isolate such bodies only by the aid of other optically active bodies. Indeed, as yet we do not know what holds the atoms even of ordinary chemical compounds together. If chemical synthesis were uniformly accompanied by an evolution of heat, we should, no doubt, infer that attractive forces hold different kinds of atoms together in one molecule; but as long as there are decidedly stable bodies, such as acetylene, in whose synthesis heat disappears, it is plain that something besides attractions or repulsions must be concerned in the effect.

When we say that we understand the constitution of a chemical substance, we mean that we know what all the linkages of pairs of atoms are, and also what those modes of connection are that are not described by saying with what atoms each atom is linked and by how many bonds, but require a "stereochemical diagram" to represent the case. We now know that the

reactions of a chemical body depend, not only upon its constitution, but also upon its impurities; for many of the most violent reagents are absolutely inert when they are absolutely pure; and there can be no doubt that the minute quantities of different salts which accompany the different albumens are essential to their chemical behavior. Even neglecting them, we cannot write the constitutional formula of any natural albuminous substance; and even if some archangel were to draw it up for us, with its fifteen thousand atoms represented by close-packed letters on a large sheet, where is the human intellect to which the diagram could reveal much? We do, however, now know, in a general way, that perhaps three-fourths of an albumen molecule consists of various alpha-amino-acids (which unite the characters of acids and bases), linked together as acid-amides—a description which, to a chemist, is sufficiently comprehensible and does not imply any terrible intricacy. There are further theories of Dr. Mann which appear to be almost proved, and which promise a still more definite conception of the protein bodies. It can no longer be said, as the chemistry books of only a few years ago told us, that the constitution of the proteins is "completely hidden in night." Dr. Mann gives a list of twenty-eight of their "primary dissociation products," or bodies which are almost fully present in the albumens, and discusses them clearly. His work professes to be based upon that of Prof. Otto Cohnheim, but in truth has many original merits of its own, and upon more than one point opposes Cohnheim's opinion, sometimes with great ability.

Dr. Mann's volume is severely scientific. Professor Loeb's, without any special charm of style or manner, recounts a history of ingenious and sound research by many biologists which will absorb the attention of average readers even if they find a reference to a dictionary occasionally helpful. Its main purport is that all the phenomena of development, self-preservation, and reproduction are capable of plain and complete physical and chemical explanation. It is not pretended that we are already in possession of such complete explanation; but that the explanation awaits only a further development of chemistry and of physiology (possibly of anatomy, too) to come to light. Upon this point, which is the kernel of his volume, Professor Loeb does not make his logic quite clear. His conclusion, that physiological life is fully explicable upon physical and chemical principles, is repeatedly asserted by him in unmistakable terms. His declarations are so emphatic that he is led to deflect such terms as "mysterious" and "metaphysical" from their precise philosophical acceptations in order to intone the disapproval, not to say reprobation, that he entertains for the opposite opinion. Yet he never tells us just how his position is supposed to be logically justified. If he only meant that it is a thoroughly vicious scientific method to introduce any other than purely physical and chemical hypotheses, in the present state of the question, then the reviewer, to speak for one very humble intelligence, would go along with him most heartily (though in opposition to some eminent anatomists), and would quite agree that it is morally wrong to contaminate science with

such uncalled-for considerations. But such a merely regulative maxim of method would, after all, concern the scientific investigator alone, and not the general public, since it would not necessarily carry with it the slightest denial of the likelihood that "mysterious" and "metaphysical" agencies are at work, but only a denial that we are yet in a condition to prove their existence scientifically. Or, again, if Professor Loeb merely meant to say that the facts already in our possession are sufficient to render it improbable that the "mysterious" and "metaphysical" agencies, even if they exist, play more than an exceedingly subordinate part in the phenomena of physiological life, then we could understand how he might perhaps logically have reached such a conclusion. But his language is too absolute to afford room for such an interpretation.

The last sentence in the book, in its two clauses, both defines his position and affords some ground for characterizing it. It runs thus: "The idea that mutation is working in a definite direction is a mere anthropomorphism [this expands the term "anthropomorphism" to a vast and nebulous word, expressive of little but the utterer's aversion to that of which it is predicated], and, like all anthropomorphisms, is in contradiction with the facts." That is to say, because the writer is a brilliant leader in a difficult branch of physiology—a degree of eminence which can hardly have been attained without almost exclusive absorption in that branch of activity—he undertakes to make an absolute pronouncement upon a vexed question which concerns every department of human experience. Nevertheless, think what we may of such questions of logic, it is undeniable that the book is full of the most instructive and extraordinarily interesting matter, in large part new to all but the most fully informed, which is presented with great perspicuity, and put in as simple a form as possible.

The Origin of Life: Its Physical Basis and Definition. By John Butler Burke. New York: Frederick A. Stokes Co.

The mad Laird's plaintive cry, "I dinna ken where I came fra," is still repeated insistently by thoughtful men everywhere. From the questions of individual and family genealogy with which the most ancient records are burdened, the inquiry has proceeded to the origin and evolution of the human race, and the source of life itself. The theories of philosophers and biologists have been endless, and the discussion has received a distinctly novel impetus from the field of the new physics, especially the recently promulgated facts and theories of radio-active matter and the dynamic philosophy of such students of physical chemistry as Ostwald. General interest was aroused by the publication some months ago of the remarkable experiments of J. Butler Burke of Cambridge, England, upon the effect of radium salts upon sterile solutions of bouillon and other organic media. Under the influence of the radiations, small bodies (termed "radiobes") appear in the medium which behave strikingly like micro-organisms in that they grow in size and later exhibit nuclei and then divide. It is held that they are not bacteria nor even protoplasm, but that they are really alive, and represent transitional and evanescent

forms of matter and energy lying between the common inorganic types of matter and stable living aggregates. This author has just published a bulky volume entitled as above, in which these facts are fully presented, with illustrations, in a setting which shows their relations to the new electric theories of matter and energy and to a general philosophy of dynamic idealism. While biologists generally will probably regard this presentation, like the earlier one, as failing to prove the author's main thesis, viz., that his radiobes are in any ordinary sense alive, nevertheless, the volume will serve a valuable purpose as an excellent *exposé* of both old and new theories of the origin of life, and of a philosophy of nature which is growing in popularity.

The Federalist System, 1789-1801. By John Spencer Bassett. Pp. xviii., 327.—*The Jeffersonian System, 1801-1811.* By Edward Channing. Pp. xiii., 299. [The American Nation, vols. xi., xii.] New York: Harper & Bros. \$2 net each.

The above volumes of the "American Nation" series treat concisely two short periods of American history which, more than any others of equal length, are at once clearly defined and sharply contrasted. Nowhere in the constitutional period do we find a more decided break in spirit and temper than in passing from the administration of John Adams to that of Jefferson; and never, surely, has there been exhibited more complete oppositeness of view and aim. Into the first period of twelve years fall the organization of the Federal Government under the new Constitution, the erection of an administrative system, and the determination of certain primary rules of constitutional interpretation. The second period saw an effort to curtail the elaborateness and repair the excesses of Federalist administration, and to enthrone in the national field a new democratic spirit. Each period is burdened with intricate and vexatious controversies with foreign nations, and with dangerous revolts against the Government at home; each is marked by violent party struggles, all the more bitter because of the personal elements which entered into, and in a measure inspired, them; but while the Federalists, more and more disregarding of public opinion, eventually pulled down their party house upon their own heads, Jefferson contrived so to guide his political following as to give it long life and even essential permanence. Lastly, while Federalist "loose construction" evolved a theory of the Constitution under which almost anything may well have seemed possible, Jeffersonian literalness, persistently decrying the whole theory for which Federalism stood, calmly accepted an epoch-making expansion of national territory for which nobody pretended to find the slightest constitutional warrant.

The treatment of these two periods by Professor Bassett and Professor Channing is in most respects praiseworthy, and, at some points, superior. The ground has been gone over so often that particular novelty in arrangement is, of course, out of the question, though the story gains in clearness by the subdivision into short chapters which is characteristic of this series. Of the two volumes, that of Pro-

fessor Bassett presents the least that is new; indeed, while the narrative shows throughout a careful sifting of material, it does not often strike much below the surface. The chapters on English manœuvring in the Northwest, Spain in the Southwest, Genet's mission, the quarrel with France, and the social conditions of the time, are distinctly good. The grave defect of the book is its singular neglect of constitutional matters. The great battle over construction, in which Hamilton and Jefferson were the leaders, must ever remain one of the most profoundly significant facts in American history; but Professor Bassett barely alludes to it, and then only to dismiss it in the most summary fashion. When one considers that all the essential substance of Marshall's doctrine is elaborated, and for the first time, in Hamilton's opinion on the constitutionality of a national bank, the document is certainly worthy of more notice than the two or three lines (p. 39) here accorded to it. The same criticism, with some relaxation, must also be passed on the account of the financial organization of the Government.

The first decade of Republican control presents, in comparison with the Federalist period, few constitutional questions of importance; and Professor Channing's hands are left free for a task in which he has long since proved himself an adept—the clear and orderly presentation of complicated happenings, the unravelling of tangled skeins of purpose and motive, and the discrimination of personal agency. We are disposed to think that the "Jeffersonian System" is decidedly the best piece of condensed work the author has yet done; and even the elaborate history of Henry Adams, to which general indebtedness is freely acknowledged, has been corrected at a number of points by this brief volume. Particularly notable are the fresh and unconventional appreciation of Jefferson as President and man, the well-drawn contrast between his earlier and later policies, and the account of the battle of orders, decrees and embargoes. If Professor Channing's work does not make Jefferson appear more admirable, it at least makes his official conduct more intelligible; while the handling of John Randolph, though critical, is distinctly more sympathetic than that of Henry Adams's biography. On the whole, the book must be accounted one of the most successful contributions to this valuable series.

The apparatus and general make-up of the series continue to be well provided for. So far as the footnotes of the present volumes show, the main reliance has been printed material. The bibliographies are reasonably full, that to Professor Channing's volume being particularly valuable because of its more extended critical comments. Of the numerous maps, special mention may be made of those showing the Georgian claims and Spanish boundary, 1789-1802, and the progress of emancipation, 1777-1804, in the volume by Professor Bassett; and the Louisiana purchase, West Florida, and Indian cessions in the Northwest, in that by Professor Channing. The collection of all the maps of this series in a single volume would be a boon to students. We note two misprints in "The Federalist System": Vigal for Vigol (p. 112), and 1900 for 1800 in the title of chapter x.

The Struggle for Self-Government. With a Dedication to the Czar. By Lincoln Steffens. New York: McClure, Phillips & Co. \$1.20 net.

With the exception of the extended dedication, which is of course new, the present volume is a reprint of the author's magazine work of the past two years, with little alteration saving the addition of a footnote here and there. The title hardly represents the contents, which deal more with corrupt conditions than with efforts for improvement. Mr. Steffens objects to having his work classified with the "literature of exposure," since he maintains that he writes only what everybody knows. In the various chapters, dealing with six different States, there is constant insistence on a fundamental identity of origin for all the corruption encountered, and that origin is the use of the machinery of government by unscrupulous business interests for private ends. With the growth and amalgamation of business interests in general, this malign species of industry has also spread and consolidated until no merely local reform of administration can be of any permanent value. Local, State, and national reforms must go together, and the people must be so thoroughly and generally awakened to the situation as to take the reins of government effectively into their own hands and out of the hands of the special interests which have gained control, partly through popular indifference and partly through a fallacious idea, natural enough in a distinctively industrial era, that business interests really ought to be in control. Self-government, Mr. Steffens holds, and not "good government," should be the first demand. The worst buccaneers who ever got possession of a city or State may consent to give "good government," clean streets, effective police administration, etc., merely as a blind to cover immensely more profitable channels of corruption. Once establish a genuinely representative government of the people, and good government will be a comparatively simple problem.

If there is any serious fault to be found with this book it is a fault of style rather than of substance. A reader whose imagination is not already unduly heated on the subject, by the constant perusal of the more sensational dailies, can hardly fail to get an impression of exaggeration, and still a careful examination gives one no basis upon which to accuse Mr. Steffens of exaggerations of fact. His indictment of the Cox régime in Cincinnati has been more than justified by the panic-stricken admissions and restitutions of just a few of the guilty beneficiaries, startled out of their usual presence of mind by the possibility of an involuntary visit to the penitentiary as a result of the recent political revolution in Ohio. The trouble, apparently, lies in too continual effort for emphatic form of statement. One's ear grows tired of such persistent hammering, and a temptation to drop the book as the mere ranting of an insincere "yellow journalist" is the price which the author pays for conceding too much to the latter's habits of speech. We fear that the dedication runs more chance of passing as a bit of up-to-date journalism than as the effective political satire evidently intended. Mr. Steffens has qualifications for very useful work as a reform-

er if he will but avoid a pit or two upon the brink of which he seems inclined to play.

Figures Byzantines. By Charles Diehl. Paris: Armand Colin.

M. Charles Diehl, whose archæological studies have carried him far and wide along the shores of the Mediterranean, seems to possess a special fondness for the life of the Eastern Empire. Here he passes from the vestiges of art that still attest the power of New Rome, to the portraiture of notable individuals. So far as this work has a special purpose, it will be found in the desire to set forth the importance of the feminine element at the court of the Byzantine Cæsars. Eudoxia, Theodora, Irene, Theophano, and Zoë are perhaps the most celebrated women whose whims or convictions affected the course of politics at Constantinople; but, from the accession of Arcadius to the Fourth Crusade, the Augusta of New Rome held, by virtue of her rank, a position such as was never attained by the consort of Charlemagne or Otto. The Salic Law is popularly known from a single provision, but of that famous ordinance against the succession of women there is no counterpart among the edicts of the Byzantine state. The notion, however widely held, that the princesses of Constantinople were reared and lived in Oriental seclusion, is erroneous. The empress had her place in the palace system, and a place which came only just below that of the emperor. Not only could she work through intrigue, as queens of the West undoubtedly did when forced by masculine prejudice from the open field of politics, but she had very considerable prerogatives, could at times mount to the throne herself, and was a factor of the first importance, whether in the days of peaceful routine or on the eve of a *coup d'état*. Theodora guarded a dethroned patriarch of Constantinople for twelve years in her own apartments, and the fact that he was there seems not to have leaked out until after the death of the empress herself. Such was the seclusion of this precinct and the completeness of control possessed by the Augusta over her private arrangements.

Unlike the queens of the West, the Byzantine empress was seldom picked out for her wealth or for the greatness of her connections. At times, to be sure, an empress was chosen in the West as Judith was chosen by Louis the Pious, simply for her good looks. But at Constantinople beauty was the pearl of great price, the necessary dower of the Augusta. By dint of a systematic quest the comely damsels were found and brought before the eye of Cæsar that he might select a spouse whose appearance would comport with her position. Doubtless in Latin Christendom beauty was never disregarded, but at Constantinople it was the determining consideration. Where a man could rise to the throne from the humble beginnings of Basil the Macedonian, it is not strange that Theodora should become an empress. Never have the vagaries of human vicissitude been stranger, more incredible, than in New Rome. It is among these beautiful women of the Byzantine court that M. Diehl finds most of the figures whose careers and personalities are depicted in the present volume. His sketches are both

scholarly and entertaining. The only feature of his manner at which we are disposed to carp is a certain fondness for wide and sometimes contradictory generalization. For instance, on page 51 he says that Theodora is the only empress of Constantinople who is at all well known; on page 217 he states that Theophano almost vies in celebrity with Theodora. Also, on pages 31, 33, and 49, there are several statements regarding the attitude of Eudoxia, after her conversion, towards Christianity which it is difficult to reconcile with each other. Apart from this tendency to employ sweeping formulas, the volume calls for nothing but praise. Perhaps the most interesting single sketch is that which portrays the ambitions of Irene, although readers of Mr. Harrison's "Theophano" will be glad to see how M. Diehl has used the narrative of Leo the Deacon in making up his tale of a famous tragedy. Regarding Theodora there is always something more or less new to be said, but such novelties of judgment as M. Diehl offers are not very startling. He inclines to soften the scandals and to give the empress credit for sustained cleverness. But nothing can soften the implacability of her resentments, or leave her with a reputation for higher qualities than those which find employment in the strife of party politics.

Shinto: The Way of the Gods. By W. G. Aston. New York: Longmans, Green & Co. \$2.

Writers on Japan who have little or no perspective are apt to imagine that Shinto has been a great educator of the Japanese people. Many wonderful things are credited to what is tautologically called "Shintoism," while the supreme part played by the ethics of Confucianism in the training of the intellectual leaders of the nation and by Buddhism, the universal faith of the people, is apt to be ignored or its importance minimized. Those writings which profess to deal with Shinto, found in the old books by European authors, from which even philosophers like Herbert Spencer obtained their so-called facts and whence they drew their deductions, were grossly misleading. They dealt with what was really a form of Buddhism, which, for the sake of revenue and other considerations, chiefly those of priestcraft, had overlain the primitive cult. The revival by a few scholars of "Pure Shinto," beginning a century or more before 1868, was made manifest and enforced by Governmental edict in that epochal year. The only writings in a foreign tongue about Shinto which are trustworthy are those of that small but noble band of British civil-servants, Satow, Aston, and Chamberlain, who, after profound researches into the early documents and primitive language, translated the rituals, poetry, and sacred books of Shinto. After years of ripened thought, they have given us the philosophy in addition to the facts. Now, thanks to their labors, one can read the "Kojiki," and the "Nihongi" in English, with an elaborate apparatus for study in the form of notes and commentary.

The earlier book, the "Kojiki" (Notices of Ancient Records) gives us the primeval legends and mythology of the islanders in purely insular moulds of thought, while the other, the "Nihongi" (Chronicles of Japan)

presents substantially the same lore, but set in the elaborate framework and terminology of Chinese philosophical conceptions. Studying these basic documents, we find that there are several cycles of tradition, showing repeated migrations from some river-valley in continental Asia, and making it pretty clear that the very many, very mixed and independent tribes in the archipelago, whether Ainu, Malay, Negrito, or Yamato, knew very little of their ancestry. They had no family life, as that term is understood in English. They did not practise ancestor-worship, and adoption was unknown. The emergence, out of phallicism and primitive beast worship, of what was in later days called Shinto, at a time when it first appears in documentary form, shows that the Way of the Kami (superiors, or "gods") is the least developed of the religions which have an adequate literary record. On the other hand, Shinto is not a primitive cult as of people in absolute savagery, for it had already in the eighth century an organized priesthood and an elaborate ritual, and the primitive forms of life of hunters and fishermen had been left far behind, while the people who held to this faith were agricultural—a fact which profoundly reacted upon the religion itself. These Shintoists, without writing and most of the higher arts of civilization, had nevertheless a settled form of government. They brewed liquor from grain, made pottery, boats and bridges, and were metal workers. In a word, they were men with bronze and iron weapons surrounded by tribes living in the Stone Age, and these tribes, their fellow-islanders, the primitive Shintoists proceeded to conquer by means of their superior weapons and their superior theology, namely, Shinto. The area of the Japan of the "Kojiki," within the ken of its first writers, was that part which may be covered when one lays a ruler over the map containing Kiu-Shiu, Shikoku, and only the southern and western half of the main island. The northern half of Hondo and Yezo was unknown, and of China and Korea the inhabitants hear only in very late times.

Borrowing from China in the seventh century both civil government and military organization, these former emigrants from the mainland and probably from the Sungari River valley, began the conquest and pacification north and south of the tribes in the archipelago. After four hundred years of activity there was, in the eleventh century, for the first time a Japanese nation. The method of the conquest is clear in the "Kojiki" and the "Nihongi" narratives. Armed with the dogma that the Mikado-clan and tribesmen were from heaven, or descended from the celestial gods, while the people to be conquered were but earth-born, Shinto was made a coercive and converting engine of high power. Nevertheless, such political machinery was in its essence only the Japanese expression of the doctrine of divine right, and was but the local variation of ideas that have prevailed wherever an immigrant race has overcome an aboriginal people. Possibly, even, it was not so different from the behavior of the average American in the Philippine Islands to-day.

Mr. Aston, who has in his various writings dissected the doctrines of Mikadoism and exposed facts patent to the critic, sums

up his life-work in this volume. He does this with pitiless logic and unanswerable argument. He treats of personification and the deification of men (that is, of the general features of Shinto), and then analyzes the myths and mythical narrative. He makes us acquainted with the odd and curious characters of the Shinto pantheon, some of whom are barely mentioned, while others are pictured with lively episode, in the ancient books. While in childish credulity the profoundly learned Japanese scholars, like Motoori and Hirata (without any sense of humor), took the stories of the "Kojiki" as real history, this author shows the Chinese origin of many if not most of them. His pages are rich also in literal translations of the rituals and the narrative texts. He proves, too, that a large amount of things unknown in the "Kojiki" and "Nihongi" are now part of modern Shinto. Incidentally, it is shown how numerous are the miraculous births and pregnancies in Japanese myths. "Mankind have a rooted propensity for imagining that it is possible to improve on the means ordained for this purpose by Divine Providence." In Shinto the substitute for and variation of a virgin birth is seen when "Susa no wo" proposed to the Sun-goddess "that they should each produce children by biting off and crunching parts of the jewels and swords which they wore and blowing away the fragments. Eight children born in this way were worshipped in after times . . . who figure largely in the genealogies of Japanese noble families."

One exceedingly valuable feature of this book, for the serious student, is that Mr. Aston has not suppressed facts, statements, and quotations which, in other books on the religions of Japan, have been expurgated from the text, in order to suit a general public on whom publishers relied for revenue. One may therefore trust his work for its truth as well as its fullness. Without taking further space in either criticism or commendation, we can heartily refer the reader to the volume, which has a good index. It is the only complete monograph on Shinto. In his final chapter, on the decay of Shinto and its modern sects, the author declares that the official cult of the present day is substantially the result of the writings of two modern native scholars, and that it has very little vitality.

A rudimentary religion of this kind is quite inadequate for the spiritual sustenance of a nation which in these latter days has raised itself to so high a pitch of enlightenment and civilization. . . . The main stream of Japanese piety has cut out for itself new channels. As a national religion, Shinto is almost extinct. But it will long continue to survive in folklore and custom.

Aus dem Leben eines deutschen Bibliothekars: Erinnerungen und biographische Aufsätze. Von Otto Hartwig. Marburg: Elwert.

When Otto Hartwig, after retiring, in 1898, from the post of Director of the University Library in Halle, settled in Marburg in Hesse, near his old home, it was his intention to devote as much of his leisure as his impaired eyesight would admit to put on paper his recollections of his life, using his personal reminiscences chief-

ly as the connecting links for an account of the affairs of his time, accompanied by comments and reflections on German libraries and librarianship. He printed, in 1900, in a small edition for private distribution, a pamphlet entitled "Aus dem Leben eines alten deutschen Bibliothekars. I., Lehr- und Wanderjahre," which was to be followed by a second part, "Arbeits- und Ruhejahre." But when he died, on the 22d of December, 1903, only the beginning of this part was finished for publication, carrying the story of his life down to 1876, or just to the moment when his real work began.

Hartwig was born on the 16th of November, 1830, in Wichmannshausen in Hesse, where his father was pastor. In 1850 he entered the University of Marburg to study theology and philology. He did not study theology in order to become a minister, but partly because his father wanted him to do so, partly because of his interest in religious questions. He took, however, in 1855, the theological examination, after which he went in residence to Göttingen to write his doctor's dissertation, on the mediæval Hessian poet, Heinrich von Langenstein, which the following year was accepted by the philosophical faculty of Marburg. In 1857 he accepted a position as "Repetent" at the University, among his duties being two hours' daily service at the University Library. He remained here until 1860, studying and working, beginning a journalistic activity which was to be, in times to come, considerable, both in quantity and quality; but the outlook was not happy in Hesse at that time for a man of liberal mind, and he accepted, therefore, in that year an offer to go to Messina, in Sicily, as pastor for the German free congregation in that city. Here he remained five years, interrupted, however, by a journey to Germany in 1863 to be treated for an eye disease which was to follow him through life, and which prevented the realization of many literary plans.

His sojourn in Sicily—his real "Wanderjahre"—was of the greatest interest and importance to him. A new field for fruitful study opened up before him, and, even if his plan to write a modern history of Sicily came to naught, his studies gave him many opportunities for literary work. He edited the earliest known city code of Messina, published in 1867 and 1869 two volumes of historical studies, "Aus Sicilien," and wrote articles and book reviews on Sicilian subjects. The Baedeker volume on Sicily is based on a manuscript that he prepared, and contains many contributions entirely from his pen. Hartwig's interest in Sicily brought him to the study of general Italian history, especially Florentine; one of his few published books is a work in two volumes entitled "Quellen und Forschungen zur ältesten Geschichte der Stadt Florenz," printed in 1875 and 1880. In 1865, Hartwig returned to Germany; in 1866 he received a temporary appointment as instructor at the gymnasium in Rinteln; and in 1867 he entered the service of his old alma mater as secretary of the University. A separate chapter of his reminiscences is devoted to the ten years during which he was connected with this institution, first as secretary, and from 1874 as sub-librarian. He says little of his actual work, and all the more, in this as in the other chapters,

of the men who lived and worked at the University, and of the general conditions of the Hessian Electorate. His reminiscences end, as already remarked, with the year 1876, when he was appointed University librarian of Halle. Twenty-two years he remained here, refusing an offer to go to Breslau as Dziatzko's successor. These years include the reorganization, recataloguing, and reclassification of the University library and its installation in a modern building, the foundation of the *Zentralblatt für Bibliothekswesen*, and an extensive literary activity, not only for that journal, but as contributor to several literary and critical magazines, such as the *Deutsche Rundschau* and *Die Nation*. But the story of these years he did not live to relate.

The volume before us contains, besides Hartwig's reminiscences and a few articles on political subjects, three biographical sketches—of Karl Hillebrand, Louise von François, and Ludwig Bamberger. Hillebrand and Bamberger both belonged to the men of '48, of whom so many came to this country and cast in their lot with what is best in American politics and civilization. Bamberger was only by accident prevented from following Friedrich Kapp to New York; he entered instead the banking house founded by his uncle Bischoffsheim in London. As banker he worked for more than a decade in London, Holland, and Paris, and returned in the middle of the sixties to Germany, where he took that prominent part in the politics of the Empire which has made his name known far and wide. Hillebrand settled in France, and soon acquired fame and influence as a littérateur in four languages, contributions from his pen being found in French, Italian, German, and English periodicals, the *Nation* included. Hartwig's memoirs of these two brilliant men were written shortly after the death of each. They are excellent examples of his art as portrait-painter.

A Modern Slavery. By Henry W. Nevins. Illustrated. New York: Harper & Bros. \$2.

The motive which led Mr. Nevins to Western Africa was the desire to show that the negroes employed upon the plantations of the Portuguese islands of San Thomé and Principe are in all but name slaves. To secure the necessary evidence he went last year into the interior of the province of Angola, whence the "serviçaes" (servants), as they are now called, are brought to the coast. His book consists of letters written at different stages of his journey and originally published in *Harper's Magazine* and *Weekly*, describing his experiences and giving the results of his investigations.

The main facts, as gathered from his statements, are these: The mortality of the serviçaes is so great (practically one-fifth die annually) that several thousand have to be imported every year; 4,572 were taken to San Thomé alone in 1901, and 1,386 in the first four months of 1905. Traders, accordingly, make a business of going into the interior, where they buy men, women, and children who are sold for various causes, as, to wipe out an ancestral debt, on account of the poverty of the family, or for the alleged crime of witchcraft

on the death of a relative. Some are simply raided or exchanged for a gun. A woman with whom Mr. Nevins had an interview at a rest-house on the old slave-route, told him that "she had come from a very long way off. . . . She thought four moons had gone since they started. She had a husband and three children at home, but was seized by the men of another tribe and sold to a white man for twenty cartridges. . . . She did not know where she was going. She supposed it was to Okalunga—a name which the natives use equally for hell or the abyss of death, the abyss of the sea and for San Thomé." They are brought down in large gangs; one passed by Mr. Nevins numbered seventy-eight, nearly all boys under fourteen. At times they are chained together, their hands shackled, and their necks held fast in forked sticks. He never saw this, but he found numerous shackles hanging on low bushes beside the path, and was assured that each shackle represents the death of one who had been unable to keep up with the march and so was murdered or left to die. Parts of his route were strewn with skeletons.

When the poor creatures reach the coast they are brought before the official representative of the "Central Committee of Labor and Emigration for the Islands" to be "redeemed" from slavery. Each native is asked by an interpreter if it is his or her wish to go to San Thomé, or to undertake some other form of service to a new master. Of course the answer is "Yes." "When a man has been brought hundreds of miles from his home by an unknown road and through long tracts of 'hungry country'—when, also, he knows that if he did get back he would probably be sold again or killed—what else can he answer but 'yes'? Under similar circumstances the Archbishop of Canterbury would answer the same." In this way the native declares, so the document reads, that "he has come of his own free will to contract for his services" for five years at a certain monthly wage, the minimum for men being about \$2.50, for women \$1.80. Although the laborers on the plantations visited by Mr. Nevins did not appear to be ill-treated, few live more than three or four years after their landing. This is due partly to the intensely hot and humid climate, but mainly, according to the testimony of the doctor who was making his official visit, to anæmia caused by misery and homesickness. The Government apparently makes no attempt to stop the buying of the natives in the interior, but considers that it has discharged its obligations to them by their "redemption" at the coast. Its only excuse is the pressing needs of the island planters. "A manager in Principe, who employs one hundred and fifty slaves on his roça, told me that it is impossible for him fully to develop the land without two hundred more, but he simply cannot afford the £6,000 needed for the purchase of that number." There is, however, a growing feeling against the practice on the spot and in Portugal. A little newspaper (*A Defeza de Angola*) appears occasionally at Loanda, in which the shame of the whole system is exposed, and it is the chief subject of conversation and politics in the province, for the population is being decreased by the traffic and its prosperity is seriously endangered.

There can be no reasonable doubt that

the slave trade and slavery exist in their worst forms in Portuguese West Africa. The question what can be done to secure its abolition is not one for philanthropists merely. As a nation we are in a measure responsible for it. The representatives of the United States were the first to sign the Brussels "General Act" of 1890, by which they declared it to be our "firm intention of putting an end to the crimes and devastations engendered by the traffic in African slaves, of efficiently protecting the aboriginal population of Africa, and of securing for that vast continent the benefits of peace and civilization." Mr. Nevinson's appeal to us, therefore, to "stand as the bulwark of freedom against tyranny" is one to which we should give most earnest heed. If public sentiment against the evil should be thoroughly aroused, his sanguine words might hopefully prove true. "Let America declare that her will is set against slavery, and at her voice the abominable traffic in

human beings between Angola and the islands will collapse."

Though human bondage is the main subject treated, it should be added that the book contains many interesting and vivid pictures of life and travel in a country about which comparatively little has been written. We regret the chapter on missions, as it has no bearing on his subject; and though the author cordially praises the missionaries for their hospitable kindness to him, his utter lack of sympathy with them makes his account of their work a mere caricature. For the rest, we unreservedly commend Mr. Nevinson for the courage and devotion with which he gave himself to his noble task, facing undauntedly not only the perils of the climate, the swamp and the forest, but the graver danger of falling a victim to those whose nefarious work he was exposing. We trust that his efforts will not have been in vain.

A New Fern Book How Ferns Grow

By Margaret Slosson. With 46 plates by the author. Large 8vo. \$3.00 net; by mail \$3.30.

A valuable contribution to fern literature in that it not only enables fern students to distinguish different species of mature ferns, but points out characteristics of the different kinds at all stages of development, and shows the genetic relations of ferns to each other and to the rest of plant life. The plates, nearly all reproducing ferns at their natural size, are particularly excellent.

George Washington

Patriot—Soldier—Statesman—First President of the United States.

By JAMES A. HARRISON,
Professor in University of Virginia.

No. 41 in Heroes of Nations.
Cr. 8vo. Illustrated, Net \$1.35.

This latest biographer of the father of his country loves to contemplate the romantic side of Washington, and to color his picture highly. For the rest the volume evinces a full study of the Revolutionary period on the part of its author. The backgrounds of the narrative are everywhere admirably painted in. The book is full of spirit and aglow with patriotism. Its author, himself a Virginian, writes with a very natural pride of Virginia's greatest son.

The Week.

Fighting the Presidential campaign two years in advance is a sort of *Kriegspiel* much in vogue just now. Apparently, every newspaper writer, every man in the street, has, in this particular, at least, taken to heart Mr. Roosevelt's exhortation to be prepared for battle before battle comes. On paper, and in the mouths of the impressive wise men who request you to mark their words while they proceed to exercise the gift of prophecy, the election of 1908 is already over and its results declared. People of this kind, whose spirits, like Metternich's, ever wrestle with the morrow, will doubtless find an impulse to redoubled energy of political speculation in the fact that Mr. Bryan admits that he would take the Democratic nomination under certain conditions, and W. R. Hearst announces that he is not a candidate. Of course, everybody can see that the assaults of Hearst upon the Democratic party have made its flesh creep and have led many of Bryan's old enemies to think well of him. But that alone could not have led to the changes by which this fiery radical of other years is made to seem almost a sober-paced conservative. The transformation is unquestionably due to President Roosevelt's policies of railway rate regulation and action against the Trusts. As Secretary Taft put it in his speech at Greensboro, N. C., on Monday night, the Democratic leaders are indignant that the Republican party "is putting into practice the principles which they, with a superb self-complacency, claim are really covered by a Democratic patent." In this radical movement, some of the Republicans—like Senator La Follette—are sincere, while others have merely wanted to take the wind out of Bryan's sails. But whatever the motive, the result for Bryan has been a surprising recovery of prestige.

Secretary Taft's message to the North Carolina Republicans is in the main characteristic of the man. In frankness and straightforward dealing it is on a par with his Ohio speech of last fall, in which he resolutely attacked the Republican State boss, and thereby, in the opinion of many, made Democratic success possible. With charming *bonhomie*, he proceeded to tell the Republicans of the South just what pitiful political figures they cut. "I do not wish to seem ungracious, but I must be candid," he declared; and he truthfully portrayed those Republican organizations

below Mason and Dixon's line which come to life only when there is Federal patronage to be had. None the less, Secretary Taft struck a lower note than the country has been accustomed to expect from him. His appeal was more to pocket than to principle. "You have become miners and manufacturers," he said in effect, "hence you should benefit by the special tariff privileges we are dispensing; and don't forget that we are going to line your purses by building the Panama Canal." With Mr. Taft's main contention that the South needs nothing so much as to divide politically, every one will agree except the dwindling number of Southerners who like to be deluded by the cheap politician with his single issue of white supremacy. Democratic solidity is as baneful to the South as long years of Republican success have been noxious in Vermont and Pennsylvania. In our system of government, an effective Opposition, and even the rotation in office of parties, is so indispensable to pure administration that some Republican partisans are beginning to ask whether sixteen consecutive years in Washington would not be injurious to their party as well as to the nation.

Currency reform must still be preached, though it seems at present like crying in the desert. Frank A. Vanderlip's address before the State Bankers' Association last week was made, not in the expectation, we presume, of any immediate reform, but in the hope that repeated warnings may prepare the public mind for action when an acute crisis comes. Among bankers and economists it is the general conviction that something ought to be done for our limping currency system, but that Congress will do nothing till spurred on by sharp financial distress. In this view, Mr. Vanderlip's reiteration of sound doctrine may be useful in showing what remedy we shall have to try when we suddenly discover that we are ill. There is no lack of knowledge among those versed in the question; Chairman Fowler gets good bills reported out from the House Committee on Banking and Currency; but Congress will not budge. Republican bankers may as well grasp the fact that the politicians who stand pat on the tariff will also stand pat on the currency.

Washington dispatches represent the Navy Department as "greatly relieved" that there has been no necessity this year for compulsory retirements of officers, there having been enough voluntary applications from men anxious to leave active service to make the required

number of vacancies. The Roosevelt Personnel act of 1899 provided that, in the event of there not being within each year 13 promotions of commanders, 20 advancements of lieutenant-commanders, 29 of lieutenants, and 40 of lieutenants, junior grade, a board of rear-admirals should compulsorily retire enough officers to make that number of vacancies in each grade. Every officer retiring voluntarily or by compulsion receives the next highest rank and three-fourths the sea-pay of that grade. Thus a lieutenant may be promoted to the rank of lieutenant-commander and then be retired at once, on his own application, as a commander with an annual pension of \$2,625, or \$25 more than the sea-pay he was receiving as a lieutenant. With this assured income the officer, probably just in the prime of life, can either obtain employment on shore from the Navy Department, in which case he receives the full pay of lieutenant-commander (a small increase), or may seek a position in civil life. His knowledge of engineering, of ordnance, or of electricity, generally secures him a good berth. Well-informed officers now privately admit that the attractions of voluntary retirement are withdrawing from the service not merely the drones and the physically feeble, but many of the most competent. This contention is sustained by a detailed examination of the retirements in 1905 and 1906. This year, for example, four captains, one commander, and nine lieutenant-commanders have been retired, of whom no less than five are of special value. A movement to change the law would not be surprising, particularly as the retired list has grown from 475 in 1898 to 720 at present, not including the Marine Corps. Somehow or other, the best officers should be retained on the active list.

The International Policyholders' Committee has formed an organization which commands respect and must exert wide influence. The names of Richard Olney, Gov. N. B. Broward of Florida, Judge George Gray, James C. Hemphill, Alton E. Parker, Benjamin F. Tracy, and Thomas B. Wanamaker mean a serious effort to give the policyholders actual representation on the directorates of the New York Life and the Mutual. If the men nominated for directors by this committee are of equally high standing, the election cannot but have a wholesome effect upon both companies. The existing administrations are inevitably under suspicion. Many policyholders will, on general principles, refuse to vote for trustees who are picked out by those now in power and are presumably friendly to them. Policyholders justly

demand that directors and officers under whom abuses flourished or under whom thorough investigation has been checked, should step out. In order to stem this tide of disaffection, the present managements must make up tickets of men who will be more than mere dummies. Indeed, the New York Life has already offered a list of uncommonly strong candidates. In glancing at the names one's first wonder is, What has become of the grave contention, repeatedly advanced before the Armstrong Committee, that you simply could not get insurance trustees unless they were permitted to take their rake-offs in syndicate transactions? Here are merchants, lawyers, judges, publishers, and others, quite ready, apparently, to take the places of Wall Street operators. Thus by pressure on the administration, the opposition, even if not victorious in form, may be so in fact.

The colored farmers of Texas at a recent convention at Houston, took a noteworthy step, by organizing vigilance committees for different sections of the State. These bodies are to run down and prosecute negroes guilty of criminal assault. The farmers have been led to this step by 73 cases of this crime within fourteen months. It is needless to say that the leaders of the race look with especial abhorrence upon criminals of this kind who not only offend against the laws of society, but do incalculable injury to the prospects of the negro. From Booker T. Washington down, influential negroes have inveighed publicly against the perpetrators of these outrages, and occasionally parties of black men have joined in bringing offenders to book—even in lynching them. The Texas movement is to be welcomed as the first organized effort on the part of negroes. It would be better for the State in the long run, however, if the authorities would organize a negro constabulary as an adjunct to their State Rangers, to preserve order in the country districts. The example of Jamaica shows the beneficent results of such a force. Law and order would be better served than by vigilance committees. Incidentally, the South has just had an interesting example of the speed with which courts can move in cases of assault. A negro who committed the crime in Maryland six weeks ago was sentenced to death last week after a trial in which all his rights were preserved. The falsity of the old excuse for lynching—slowness and uncertainty of the courts—is thus once more exposed.

A serious accident in the Manchester Ship Canal on June 21 gives fresh and ominous point to the warnings which William Barclay Parsons and other engineers addressed to the Senate com-

mittee. They argued against the plan of placing three locks in flight at Gatun, as in the accepted project for the Panama Canal, pointing out the peril of thus putting all the eggs in one basket. They maintained that if, by accident, a ship should get out of control and crash through the gates of one lock, she would be certain to carry out all three; whereupon the canal would be drained, and it would be the work of two or three years to put Humpty Dumpty back again. Well, something very like that, in miniature, happened at the Irlam locks of the Manchester Canal. A steamer of only 700 tons, the *Cassia*, by some blunder made for the wrong lock. Though she had but little way on her, she destroyed one of the gates, the weight of water broke in the others, and the safety gates which were promptly set were also speedily swept away, and all the water higher up the canal poured out to sea. Traffic was entirely suspended for two days, till the spare steel gates could be got in place. It was, of course, a comparatively simple affair in such a canal; but imagine an accident of the kind at Gatun, 85 feet above the sea!

As the passage of the Education Bill in the Commons draws near, Liberals like Lloyd George and Secretary Churchill are beginning to attack the Lords. The reason is that the latter have threatened to emasculate the measure, if not to reject it outright. Hence the violent talk about "worn-out Parliamentary machinery," and "an irresponsible assembly." But it is extremely improbable that a sharp issue will be raised in this way in English politics. The lesson read to the House of Lords in 1832 has not been lost upon it. The peers know well that there are limits beyond which they cannot safely go. They ran some risk when they rejected the Home Rule bill of 1892, but the Cabinet was not ready to follow Gladstone in an appeal to the country to "end or mend" the House of Lords. That body's active membership is composed of men who know what is going on. They do not live "up in a balloon," as Gladstone rhetorically asserted. Many of them have served in the Commons, and know its temper; they read the newspapers; they converse with their fellow-beings. So they know that it would never do to provoke a trial of strength with the Commons deliberately. While, therefore, they may amend the Education Bill, it is unlikely that they will stand out too long or too stiffly on the essential clauses. When they really want to lock horns with the representatives of the people, they will choose firmer ground to stand on.

Fears for the supremacy of Marseilles as a Mediterranean port may seem groundless, yet they were expressed the

other day in Paris by M. Guillard, president of the Society for the Defence of the Commerce of Marseilles. Since the opening of the Suez Canal restored to that city her old prominence, and gave fresh title to Chavannes's fresco representing her as "Marseille, Port de l'Orient," her position as a shipping centre has been thought to be beyond challenge. But Genoa is pressing hard, while Barcelona is coming forward rapidly. Yet Marseilles perceives a still more formidable rival farther north. She is disquieted by the great diversion of Oriental trade to Hamburg. The rapid progress of that port is, indeed, used by Marseilles as a powerful argument for the improved communication which she wishes. Hamburg sits at the confluence of vast interior water routes. Rivers and canals, as well as railroads, bring and take the goods that pass through that harbor. But Marseilles is almost isolated. Her railroad connections are meagre, and nothing has been done to carry out the project, as old as Vauban, to connect her with the Rhône by a canal. The execution of this plan is now demanded as a means of making Marseilles, not merely what she now is, the first commercial port of France, but the leading point of trans-shipment in the Eastern trade.

Gen. André, former French Minister of War, is publishing in the *Paris Matin* some highly sensational recollections of official experiences. The first instalment contains an almost incredible story of an attempt to thwart his efforts to end the tyranny of the military bureaucracy by a thorough-going reform of his department. He soon decided that three lieutenant-colonels of the General Staff should be removed for the good of the service. The chief of the General Staff, Gen. Delanne, tried to resign, but, not being permitted to, insisted that he alone could make changes in the staff. While the situation was still critical, there appeared in Gen. André's office, Count Muravieff, the Russian military attaché, who not merely asked, but bluntly demanded, the reappointment of the three lieutenant-colonels on the ground that he, the representative of an allied Power, wished it. Naturally, Gen. André refused this extraordinary request, whereupon Muravieff exclaimed: "I am bound to tell you that you have not kept to the Russian alliance." This "bluff" nearly succeeded, for Gen. André had never seen the secret treaty. He speedily learned, of course, that nothing in that document bore in any way upon the French General Staff, and that Muravieff was merely the tool of the General Staff clique which had hitherto run the army as it pleased, and actually believed that Gen. André would permit a foreign officer to dictate his policy. The incident recalls the revela-

tions of the Dreyfus retrial, and proves again that the French General Staff was corrupt and demoralized—a national danger instead of a safeguard.

The German colonial scandals show no signs of abating; and the official Cologne *Gazette* has found it necessary to come once more to the defence of the Colonial Bureau, now attacked on all sides. It demands a cure-all for present troubles the creation of the independent Colonial Department which the Reichstag refused to allow. Meanwhile the police have searched the office of the Berlin *Freisinnige Zeitung* in a vain effort to ascertain names of the officials who recently supplied the paper with a confidential report to Prince von Bülow. This document has naturally made a sensation. It was the result of an investigation into the allegations against Herr von Puttkamer, governor of the Cameroons, by a permanent official of the bureau, Privy Councillor Rose. That gentleman recommended retiring Von Puttkamer on a pension, and dropping the whole matter. As this report was confidential, and of recent date, there is obviously a serious leak in the Colonial Bureau. Fortunately for the public, the incident has compelled Herr von Puttkamer to change his mind and ask for an investigation of his administration by a disciplinary court. Meanwhile, Berlin is full of rumors and allegations of misdoing, not only in the Cameroons, but among troops and officials in German Southwest Africa. Germany is reaping the crop of her colonial sowing.

The visit of the German editors to London has started a controversy as to whether the modern journalist is or is not the chief cause of war. Dr. Theodor Barth, the distinguished Berlin editor, maintained that the "press of every civilized country" was "always in arms," and called upon the Hague Conference to begin its work by "disarming the journalists." Lord Avebury was of the same opinion, and asserted that newspapers can make peace or declare war. This the *Spectator*, whose editor was a speaker on the same occasion, denounces as "pure clap-trap." Disagreements among nations, it says, arise only out of the policies of rulers and governments. Of course, there is truth on both sides, as may be illustrated by the part played by our sensational journalists in bringing on the war with Spain, and also by the hostilities engendered by our monstrous tariff. The dispute did not detract from the success of the visit of the German editors. Like that of the burgomasters in May, it has done much to bring about a better understanding between the two countries. Their peace is menaced only by the now rare indiscretions of the German ruler and by the

venom of those newspapers, German and English, which harp on a jealousy that has but slight ground for existence.

Gen. Trepoff's assertion that the Jews are responsible for the Russian massacres by provoking the Christians and "skilfully posing as martyrs," may reflect the policy of the reactionaries, but it is none the less preposterous. Who ever heard of men willing to incite massacres in which they are certain to be killed, their women dishonored, and their children butchered? Moreover, the Munich *Jugend* has just reprinted from a Russian Government organ an item which shows that Trepoff's theory is not original with him. It is entitled "A Conversation Overheard at Bialystok," and runs as follows:

First Jew—"I must say I am no longer happy in Russia; for three weeks there has been no massacre of Jews, and where is there such happiness to be found as being massacred?"

Second Jew—"How would it answer if we should kill the priest?"

First Jew—"That would not do. We must infuriate the Christians to the point of losing their senses. Think of the disappointment if after killing him we should not be massacred!"

Third Jew—"What if we should set fire to the church?"

Second Jew—"Even that would not be certain to cause our death."

First Jew—"But if we should throw a bomb into a procession?"

The Others—"God bless you for this thought! What joy! I already feel my eyes being torn from my head. I see a bloodshed never before equalled. Heaven be praised that we can at least induce these miserable Christians to slaughter us."

The Russian newspaper, always hitherto a supporter of the Government, adds: "And so it came about. Our report of this conversation is the most reliable, since it was written by the agent of the Government who himself threw the bomb into the procession."

The report that Lyman J. Gage, formerly Secretary of the Treasury, is dallying with theosophy as expounded by Mrs. Tingley at Point Loma, Cal., raises the question as to the attraction of this religion—if such it may be called—for certain minds. Many years ago a callow youth in a Western city was reading that stupendous work of Madame Blavatsky's, "Isis Unveiled," which was the foundation of theosophy. He had got through the first volume and was begging the young woman at the Public Library to save the second for him, when it came in; for the book was in constant demand. "How did you like the first volume?" said she. "Very much," replied the lad, "only I didn't understand it all." "Ah," cried she, ecstatically, "but you are not expected to understand." She understood hu-

man nature so well that she is now at the head of one of the largest libraries in the country. The young man was only in his first childhood, and so recovered; but the incident shows the fascination which theosophy has exercised over the unstable. Here is mystery flung at you with both hands, here is a system of ethics which professes to date from the beginning of civilization; and here, too often, is an alluring, half-expressed idea that the restraints of common morality are for the uninitiated alone, and that in the higher regions the acts of the body have no effect on the life of the soul. It need not be said that theosophy as commonly taught is about as near as Christian Science to the genuine religion of ancient India. The only strange thing is that theosophy, with all its glamour of pseudo-Orientalism, has not, like Christian Science, drawn multitudes in its wake. The explanation, no doubt, is that it has never advertised its attractions by offering health without drugs.

"American Advertising" is the title under which the London *Athenæum* exposes a scheme for swindling. The vicar of a country parish, it seems, was shocked to receive the following post-card:

REV. SIR: I feel it my duty to bring before your notice an extraordinary attack made upon you in chapter ii., page 15, of a recently published book entitled "Parsons and Pagans." The book is published by Henry J. Drane, and the author's name is Vivian Hope. The matter may possibly have been brought to your notice, otherwise it seems to demand attention. Could not the law of libel be invoked?

Yrs. truly,
(signed) E. FITZHERBERT.

The quiet clergyman knew the card had been seen by the postman and by his own servants who must have inferred that he had done something disgraceful; but when he got the book he found it contained no reference to himself, direct or indirect. Later he discovered that other persons had also been victimized. The publisher, Mr. Drane, when called to account, explained that it was "an American form of advertising," for which the author, not he, was responsible. Mr. Drane may be well informed. Certainly, this method of pushing a book has a diabolical ingenuity worthy of American enterprise at its worst. Moreover, because of scandals in life insurance, beef-packing, and railway and Trust management, the commercial reputation of America is so blackened, that the world is ready to lay at our door any unfathered villainy. Yet we hesitate to admit that the United States has a monopoly of depraved intelligence. Europe was well stocked with rascals before ever the caravels of Columbus set sail; and it was not our Government which issued a patent to the inventor of the seven deadly sins.

THE JUDICIARY NOMINATORS.

After the Jerome Nominators of 1905, the Judiciary Nominators of 1906. The second movement is clearly modelled upon the first, and is of almost equal political significance. We have had much vague talk about "taking the judiciary out of politics," but this is the real thing. What we have had in the past has been an occasional upheaval over a scandalous judicial nomination, like Judge Maynard's, or a scandalous refusal to renominate, like that in the case of Judge Daly; but the general idea about taking the judiciary out of politics has been to let two bosses, or two machines, get together and divide the judicial spoils. From all that the Judiciary Nominators of New York have cut loose, and have given us a ticket named without consulting a single boss or currying favor with a single politician. A similar movement has already taken form in Erie County, and judges are to be nominated by the same method in Brooklyn. If the plan is successfully carried out, it will echo through the country as did Mr. Jerome's success, and, like it, will be a fresh demonstration of the fertility of Americans in political resource. Thus it is that the details of this contest are of interest, not merely in New York city and State, but wherever men are working to heighten political independence and purity.

Nothing but praise is heard of the candidates for the bench whose names are now announced. They were sifted from among the more than two hundred lawyers whose fitness for the judicial office was scrutinized by the committee. Political affiliations were entirely ignored; and legal attainments, age, and capacity for hard work made the sole tests. Notable is the omission of certain names that had been supposed "sure of a place." They were of men like Senator Nathaniel A. Elsberg and Corporation Counsel John J. Delany. Their legal qualifications may be conceded, but their claims were political. They had fairly "earned" judgeships, it was said, by faithful service to party. But they were wisely passed over by a committee bent on showing that the way to advancement lies in ability and character, rather than in subservience to party organization or boss. Hence the names that do not appear on the ticket are as significant as those that do. It is safe to say that a judicial ticket selected with such care and intelligence, and so free from stratagems and spoils, has never before been offered to the electors of this city.

One objection clings which is likely to be urged wherever the example of New York is followed: this is a "professional" ticket. Lawyers are nominating themselves. They are standing apart from the rest of the community. They

would set up as a close corporation, representing the narrowness and jealousy of a profession. Well, we think the lawyers may rightly make their own the reply of Lord Lyndhurst, when he and the other law lords were accused of "jealousy" in opposing Palmerston's proposal to create new law lords with only life peerages. The old Chancellor turned the objection against into an argument for. He and his fellow-lawyers were "jealous." They were jealous for their profession, "and, my lords," he added, "do not forget that jealousy is of the very essence of our Constitution." That is to say, any one great interest or power in the state must be on its guard against encroachments by another. In that sense, the lawyers of this city, and of other cities also, do well to exhibit a proper jealousy. They have seen their profession raided and debauched by politicians. They have seen unfit men put on the bench by politicians. They have seen judicial honors practically bought, or given to grovellers. They have seen the courts congested and justice denied, partly on account of incompetent judges. It was high time, then, that they bestirred themselves to remove the reproach from their profession and the evil from the public service. If in a narrow sense their movement is in behalf of their own calling, in the truest sense it is for the public good. It comes down to this: lawyers must be chosen as judges; who is better fitted to select proper candidates, their fellow-lawyers, or dickered politicians? Grant that the lawyers are acting *pro domo sua*; they are at the same time working for the common weal.

The ticket is up. It will be legally put in nomination by petition. It will stick till election. What the party managers will do about it does not yet appear. They are at present sniffing at it like puzzled dogs, just as they did at Mr. Jerome's nomination last year. If they are wiser now than they were then, they will endorse the work of the Judiciary Nominators, instead of attacking it with disaster to themselves. But in any case there should be instant response to the appeal for volunteers in this judicial campaign. Work will be needed and organization and money, in order that this promising movement for the further enfranchisement of the people from the tyranny of boss government, and for the dignity and independence of the judiciary, may not fail.

A UNITED STATES COURT IN CHINA.

Another of the improvements which Secretary Root's legal acumen and good head for business have brought about since his going to the State Department is the creation of a United States Court in China. At the urging of Mr. Root, Congress passed a bill to establish it, and now comes the appointment of the

first judge. The present Attorney-General of the Philippine Islands, Lebbeus R. Wilfley, has been selected. His training and experience promise success in this novel jurisdiction. It has been set up in order to supersede, in part, the extraterritorial jurisdiction of our consuls in China, and to correct judicial abuses which have grown up under that system. Consuls are still to have jurisdiction in civil cases where the sum involved does not exceed \$500, or in criminal cases where the punishment is not greater than \$100 fine or 60 days' imprisonment; but appeal shall lie to the United States Court.

This news falls significantly with a recent dispatch from Dr. George Ernest Morrison, the Pekin correspondent of the London *Times*, setting forth the unsatisfactory administration of justice in Shanghai. Under the system of mixed courts, in which a Chinese magistrate sits with a foreign assessor in all cases affecting foreigners, unhappy practices have been introduced. Naturally, the native judge seizes every opportunity to assert a purely native jurisdiction, with the result, affirms Dr. Morrison, that "in civil cases both plaintiff and defendant can be squeezed unmercifully, while in criminal cases the poor are punished brutally and the rich can buy immunity." Foreign governments have long been seriously dissatisfied with the working of this system. After years of discussion, without result, they last March submitted to the Chinese Foreign Office, through the Diplomatic Body, a set of redrafted regulations to govern the mixed courts; yet an agreement has thus far been blocked by the Chinese. Now we have our new court.

It is, of course, a part of that extraterritorial jurisdiction which we, in common with several other nations, have by treaty the right to exercise in China. The time seems distant when the Western world will be content to waive this in China, as we did in Japan in 1894. Chinese conditions of government, and of the administration of justice, being what they are, resident foreigners would not feel that they were safe in submitting to native courts. And the amount of legal business concerning American merchants and missionaries resident in China is large, and constantly increasing. The last "Statesman's Year-Book" puts the total number of foreigners living in the open ports of China at 27,227, about one-half of whom are resident at Shanghai. There the United States Court is to be erected, though its jurisdiction is to extend over several provinces. According to figures published by the customs authorities, there were, at the end of 1904, more than 3,000 Americans residing in the open ports. In connection with their mercantile contracts and transfers of property, both before and after death, there must be frequent need of getting judicial deci-

sions, and it is axiomatic that they ought to be rendered with as great authority and integrity as possible.

Consular jurisdiction has been, for obvious reasons, unsatisfactory. Those scalawag appointees of McKinley's who have recently had to be removed from the consular service in China, were under grave charges of malfeasance in precisely their character as judges. If we may believe what was publicly alleged of them, a Chinese *taotai* could not have been more oppressive or venal. But leaving out corruption, and supposing that all our consuls were honest, few of them know law enough to make them fit judges. Nice questions of nationality, of domicile, of marriage, of inheritance, of taxation, of property rights, to say nothing of crimes, are all the while coming up for adjudication, and what consul is sufficient for these things? He should have a fair knowledge of the common law, with some acquaintance with the *lex loci* and a good understanding of the principles of international law. That the actual consul in China as we know him has been deficient in these respects, no one will deny; hence the importance of the court which is new to hear and dispose of cases involving Americans in the Chinese Empire will be generally conceded.

In addition to the general exercise of extraterritorial jurisdiction in China, there are special privileges attaching to the concessions, with their foreign communities, at the treaty ports. The greatest of these is at Shanghai. Here the various nationalities have their concessions, within which land may be rented in perpetuity; and though China still asserts sovereign rights over the whole, they are practically never enforced, and are little more than an empty form. There is even a sort of foreign municipality at Shanghai, under the land regulations of 1866, which has power to levy taxes and enforce municipal ordinances. The legality of the latter was upheld by Secretary Bayard in 1887. We refer to these complexities of government because they reinforce the argument for having a learned judge, instead of a haphazard consul, in charge of the legal interests of American business men and missionaries resident in China.

BRIGADING THE ARMY.

Secretary Taft's announcement that the army is hereafter to be concentrated in large posts or barracks will be heartily welcomed by the troops and by those interested in economical administration of the service. For the present, seven posts have been selected for enlargement: Forts Riley and Leavenworth in Kansas, Sam Houston in Texas, Robinson in Nebraska, D. A. Russell in Wyoming, Sill in Oklahoma, and Oglethorpe on the battlefield of Chicka-

mauga. To these will soon be added a post in the East, perhaps in Pennsylvania, and one on the Pacific Coast. When these changes have been carried out, the break with the army of 1870 to 1898 will be complete. In uniforms, equipment, training, spirit, in everything save in tradition and in the continued influence of politics, the army of to-day is an improvement upon that of the quarter of a century succeeding its reorganization in 1870.

In those years the thirty-five cavalry and infantry regiments were scattered over the frontier in small one or two-company posts. Sometimes there were battalion posts and less frequently regiments came together for brief periods. Manœuvres there were none, save in 1886 and 1893. Generals never took actual command except in the emergency of serious Indian uprisings, most of which were settled by captains and colonels. Company officers might spend years in the service and never see a battalion drill. But as the West was opened up by the railroads and the Indian wars died out with the Pine Ridge campaign of 1890-1891, the Washington authorities came to a realization that a rearrangement was advisable, particularly as many an old post was tumbling to pieces. Unfortunately, the War Department decided upon the regimental-post policy, which easily fell in with the schemes of politicians. Thanks to their influence, the new posts were often located with far less regard to strategical value than to benefits to be derived by land speculators or trades-people. Hideous brick barracks, devoid of architectural beauty, began to appear near centres like Chicago, Little Rock, Spokane, Burlington (Vt.), Des Moines, etc. At Omaha a beautiful old post was abandoned, and a new one built to please the city; and at dwindling Helena the ugly post of Fort Harrison was constructed to reward certain politicians.

The new policy goes a step further. It looks to the creation of posts garrisoned by between 2,000 and 3,000 men, so that officers may be trained not merely in battalion and regimental evolutions, but in brigade exercises as well. Instead of separate posts for infantry and cavalry, there will be garrisons comprising not only horse and foot, but also light artillery. Thus the three combatant branches will drill together, and each learn about their mutual dependence and their respective functions. More than that, small posts are uneconomical from the military point of view, because many men must be deducted from the active strength for guard duty, punishment, illness, and for performing police and other duties executed in England by the general service corps. In two-company posts, where the strength was, say, 120 men in all, it was rarely possible to parade more than 35 men to a company, with the result that exten-

sive drills were impossible. Practically as many men are needed for fatigue duty in a small post as in a large one. At least, the concentration of 3,000 men in a post enables a far larger proportion to turn out for drill than where there are 120 or 200.

From the point of view of the quartermaster or commissary, the large post is also much more economical. Food and supplies for 3,000 men can more easily be delivered at one place than at five, particularly if some of those five are not on any railroad. Hence the taxpayer should doubly welcome Secretary Taft's plan. He should get a more efficient army at relatively lower cost. Fort Leavenworth, our American Aldershot, years ago proved the desirability of large posts from the strictly business point of view, as well as the military. And if, as is to be hoped, the United States, by withdrawing from the Philippines, shall be able to reduce its army as it did in 1870, the establishment of brigade posts would not interfere with the mustering-out process. Such as are not then needed may be used by the militia, or kept up for national emergencies.

Finally, the brigade posts will be of great value to our generals. Until lately these men have been merely officers of the roll-top desk, sometimes never wearing a uniform or mounting a horse in a year's time, and wholly disassociated from the troops. Their commands in many cases are still merely geographical divisions, arbitrarily laid out, and their function the signing of official papers before forwarding them to Washington. In brief, the American general prior to 1898 was, except for clerical routine, as idle an official as could be found in the pay of the Government. As a result, when war broke out in 1898, only three of our generals—Miles, Merritt, and Brooke—had ever manœuvred brigades, and their experience was almost wholly due to the civil war. Under the new plan, a general will have opportunity to learn his duties, and will be compelled to show his ability to handle large bodies of men. The abolition at least of some of the geographical commands should soon follow.

ENGLAND IN EGYPT.

Sir Edward Grey's fears of a Mohammedan uprising in Africa, and especially in Egypt, are not to be lightly passed over. The Liberal Foreign Secretary does not belong to the school of diplomatic sensationalists; and trouble of this kind is the last thing his administration is hunting for. Memories of the humanitarian Gladstone bombarding Alexandria to check what Lord Randolph Churchill called the "legitimate uprising of an oppressed people" and waging against them "a wicked war, an unjust war, a bondholders' war," ought

to make Sir Henry Campbell-Bannerman wary lest history repeat itself. There are, as it is, quite enough parallels with Gladstone's Government of 1880 and its unwieldy majority, without courting a repetition of his bungling Egyptian campaign. England, moreover, has fought enough for this generation. Hence a vision of Egypt and the new-won Soudan blazing afresh with fanatical warfare is enough to make any Ministry uncomfortable.

True, no Kandolph Churchill is now at hand to badger the Prime Minister about his Egyptian policy; but lesser critics are ready to heckle at every opportunity. For instance, John Dillon's protest against the barbarity displayed in publicly flogging and executing the natives who recently murdered a British officer was proper and manly. For this performance Sir Edward Grey has assumed full responsibility, but he should realize that a Mohammedan outbreak, if one be impending, can no more be checked by this means than the progress of liberty in Russia by official orders for bloodletting. Such repressive measures are only fuel for the flames of discontent. The fellaheen who witnessed the executions may have been impressed by the severity of their English rulers; who can believe that their liking for their self-appointed masters has been increased by this ferocious reprisal? Indeed, the most depressing part of the whole affair to Englishmen ought to be the demonstration that, for all her reforms, England controls in Egypt only by her rifles.

Some realization of this sad state of affairs may have lurked in William J. Bryan's mind when he said in his Fourth of July speech that "wars have been waged for the alleged improvement of those attacked, and still more frequently philanthropy has been adulterated with selfish interests." Undoubtedly, it was a pecuniary motive which, first of all, led England into Egypt; but since Lord Cromer began to bring order out of the chaos of 1882, it is only fair to say that his Administration has been primarily for the Egyptian himself, instead of for the foreign bondholder. How remarkable his achievements have been, is set forth in detail in Sir Auckland Colvin's new volume, "The Making of Modern Egypt." The winning back of the Soudan, the complete reconstruction of the Governmental machinery, the improvement in the courts, the success of vast irrigation projects, and the laying by of great surpluses where formerly there were large deficits—all these triumphs Sir Auckland describes. Egypt is probably the best illustration of the government of an "inferior race" by foreigners; yet nowhere to-day is the failure of the conqueror to win the affections of the conquered more evident. Sir Edward Grey and Lord Cromer may, if they please, think

the Egyptians ungrateful; but the fact remains: England is battering down a fire in the land of the Pharaohs, and after striving earnestly for two decades for its regeneration, finds herself compelled, on the twenty-fourth anniversary of the bombardment of Alexandria, to increase largely her garrison of European troops. Boast of Anglo-Saxon prowess as you may, it has never yet fought or governed its way into the affections of a subject people.

Religious differences naturally are one main cause of this failure. But they cannot explain everything. The fellaheen are richer and freer; they enjoy a justice unknown under Ismail and Tewfik, and forced labor is practically abolished. Yet somehow they are still dissatisfied. Even if translations of Sir Auckland Colvin's excellent book were to be freely distributed, disaffection would not cease. The natives might be pleased to recall that before Cromer's coming there were no telephones and no electric cars in Cairo. Boatmen no longer pay heavy tolls for passing under the bridges of the Nile. The whole system of fisheries has been reorganized and bettered; and a great educational structure has been reared. Yet, as Sir Malcolm McIlwraith, the judicial adviser to the Khedive, has admitted, every step in the introduction of European officials and European methods is still systematically denounced in the native press.

Mr. Bryan perceived another truth when, speaking of the effect of self-government in the United States upon the world's ideals, he said that such a conception "will sometimes revolutionize an individual, a community, a State, a nation, or even a world, and the idea that man possesses inalienable rights which the State did not give and which the State, though it can deny, cannot take away, has made millions of human beings stand erect and claim their God-given inheritance." There is still behind the Egyptian situation that national feeling which Mr. Gladstone crushed when he defeated Arabi in 1882. The fellaheen would gladly be poorer if they could but get rid of the haughty white man. Nor is this fact denied in Sir Malcolm McIlwraith's observation that the upper native classes feel a profound distrust, and even alarm, when wider power and responsibility are put upon native officials. Similarly in the Philippines some Filipinos dread what might happen if the Americans should withdraw. But whatever the sentiments of the upper classes, the rank and file of the people are angry and sore. Indeed, the whole Egyptian experiment is full of warnings for those who believe that Americans, too, are called on to govern another people against their will.

HUMOR IN HIGH PLACES.

The dying hours of Congress were enlivened by several humorous speeches. Two Representatives, in particular, Mr. Boutell of Illinois and Mr. Cushman of Washington, got and held the ear of the House, and enraptured the galleries. Neither of these gentlemen would confess to being a humorist. That would be almost suicidal for a Congressman. Proctor Knott's fate is still a powerful deterrent to aspiring statesmen, who perceive what solemnity has done to make some men great. Yet it is true that Messrs. Boutell and Cushman are among those most gladly heard, and that their humorous sallies may be said to be typical in our Congressional oratory.

In general, they aim at broad effects. Exaggeration, distortion, the extreme of caricature, are frequent in their mouths. Mr. Boutell, for example, in his controversy with Representative Rainey, accused him of advocating "Government by Advertisement," and proceeded to read a lot of imaginary advertisements. They were all of the "shriekingly funny" kind. The point of one of them is, we suppose, due to the fact that Mr. Rainey is rather hirsute. It runs:

Ganderine for the Head, the Most Amazing and Stupendous Discovery of this Age of Marvels. What is Ganderine? It is an occult distillation of the secret alembic of an unknown chemist who has lost the prescription and forgotten the formula.

[Laughter.]

Ganderine is duplex in its action and works while you sleep.

[Laughter.]

Shake it with the right hand and Ganderine removes hair from the scalp and wheels from the brain; shake it with the left hand and Ganderine puts wheels in the brain and hair on the scalp, etc.

To sample Mr. Cushman's humor, observe him in a duel of wit with Bourke Cockran. It was ended by the Washington Representative saying:

I want to pay the gentleman a tribute. My admiration of him was so great that a few days ago I went to a near and dear friend of his to make some inquiries regarding the gentleman. And I said to that friend of his: "Is it possible, sir, that in all of those equally masterful and misleading addresses which the gentleman 'pulls off' upon this floor he speaks entirely without preparation—absolutely extempore? Has the gentleman no thought of what he is going to say when he rises to speak?"

And his friend said to me: "Mr. Cushman, I not only assure you that he has no idea of what he is going to say when he rises to his feet, but what is more wonderful than that, he speaks with such unusual fluency and enthusiasm that he does not even know what he has said when he sits down." [Great laughter.]

These specimens would, we presume, be called types of "American humor." They are at least types of Congressional humor. But we are not sure that the

physical conditions under which it is produced do not determine its character. Imagine a vast and noisy hall like the House of Representatives, with tired and indifferent members all about and drowsy people filling the galleries, and then ask how delicate sword-play of wit would fare in such a place. The cleaver or bludgeon becomes almost the enforced weapon. Jokes must be bellowed, or they will not be heard. The funny man must speak through a megaphone. He must make his caricatures as big as a barn and as red as a country school-house. The Speaker knows that everything of the nature of subtle innuendo, quiet asides, and suggestive allusion would be lost, and so he goes in for the big bow-wow of humor.

House of Commons humorists have a great advantage over our Congressional. They speak in a room so small that a low-pitched voice may easily be heard. Often, they lean across the table to stick pins into their adversary on the opposite bench, instead of having to shout long-distance defiance at him, as our Representatives do. The nicer play of wit is possible under such circumstances. You then get "Lulu" Harcourt planting his *banderillas* in Chamberlain's neck; you get Herbert Paul and his Oxford rival, Mr. Smith, delivering their rattling fire of epigrams and sub-acid retorts and classical reminiscences at each other's head. The audience, the tradition, count for much, but the contracted space also for much. House of Commons wit is more like dinner-table wit, partly because the House is not much larger than a dining room.

The sparkle of *esprit* in the French Chamber may likewise be attributed in a measure to physics and acoustics. There is, of course, a differing standard of wit, as of oratory; but when the tribune is close to the desks, it is easier to have such a flashing give-and-take as occurred the other day between Clemenceau and Jaurès. That the distinction between the humor of Deputies and that of Congressmen is one of form rather than substance, may be gathered from the final exchange of retorts:

Jaurès. "Vous n'êtes pas le bon dieu."

Clemenceau. "Et vous, vous n'êtes pas même le diable."

THE KING'S ENGLISH.

"The King's English," recently issued from the Clarendon Press, has excited more comment in England than any work of the kind since Dean Henry Alford's "The Queen's English" (1863) and George Washington Moon's tart rejoinder, "The Dean's English." The book has attracted this attention partly because many of its horrible examples are culled from the respectable columns of the *Times*, *Spectator*, and *Westminster Gazette*, and partly because it is, for a treatise on rhetoric, uncommonly sane.

The *Spectator* takes the drubbing with good humor, generously praises the book as "delightful reading, if only for its wit and urbanity of style"; with sorrow confesses its sins, but asks whether, after all, "the tests are not too hard."

From one point of view they are too hard. Writing for daily or weekly publication can seldom strike a high level. Modern journalists too often follow Shakspeare's example in never blotting a single line—not that they regard their product as impeccable, but that they have scant time for revision. The event of the week, an earthquake in San Francisco or the adjournment of Congress, presses for notice; the clock ticks, "Now or never." All things considered, the wonder is not that journalistic writing is generally bad, but that it is ever good. To censure its fugitive sheets as less carefully finished than Gibbon's "Decline and Fall" is like condemning a shelter tent because it is not St. Peter's at Rome. And yet if editors were content with the average output from their shops, the English of all dailies and periodicals would melt and swim in a deliquium of inanity. The ambitious journalist must keep his eyes on the classics. As a critic of books he is far inferior to Sainte-Beuve; as a political philosopher, he is not to be thought of with Burke; but unless he is familiar with his Sainte-Beuve and his Burke, unless he aims to come as near them as his powers and his subject permit, he fails. However indulgent his readers, he must always be intolerant of his own slipshod performances—hitch his wagon to a star.

He may well take to heart, then, the warnings of "The King's English." He may not assent to all the rules and suggestions, but he cannot deny that he should prefer the familiar word to the far-fetched, the concrete to the abstract, and the single word to the circumlocution. He knows, when he stops to think, that "bad as the weather has been" is far more effective than "despite the unfavorable climatic conditions"; and that to press "proposition" into service at every emergency, and to confuse "sewage" and "sewerage," "transpire" and "happen," "visualize" and "see," "shall" and "will," tends to destroy the usefulness of all these words.

Yet "The King's English," excellent as it is, has the defects of books of the kind: it is concerned chiefly with details of phrasing; it inculcates the negative virtue of avoiding gross errors, but offers little on the constructive side; it does not show—perhaps no book can—how to shape and proportion the whole, and impart interest and life. Of course, no man can be interesting unless he has something to say; but he must also be able to disentangle the significant from the insignificant, and to distribute his emphasis justly. The complete master of the precepts in "The King's English"

might produce articles inflexibly precise and at the same time so slow in movement as to be unreadable. The fault of much manuscript submitted to this journal, for example, is not erratic punctuation, grammatical blunders, or improprieties. These are superficial vices. The articles are clogged with words, all of them correct, a fourth of them superfluous. In preparing manuscript for press more editorial labor is spent on trimming out the undergrowth of words than on any other one thing. Learned gentlemen imagine that we are eager for papers which begin thus:

Among the many interesting questions—and they are various and important—which are being discussed at the beginning of the twentieth century by educators in all parts of this country, none demands more, if as much, serious consideration from parents, teachers, and pupils, from college trustees and school superintendents—in a word, from all those who are devoted to the development of humane studies—than the instruction of our boys and girls in the fine, and we may even say indispensable, art of writing English.

All this recalls an incident in Boswell's "Life of Johnson." "I took down Thomson," said Johnson, "and read aloud a large portion of him, and then asked, 'Is not this fine?' Shiels having expressed the highest admiration, 'Well, sir,' said I, 'I have omitted every other line.'" Every other line is not enough in the passage printed above. Apply the blue pencil unsparingly, and we get something like this:

Teaching English composition is one of the most important questions now before educators.

Pruning is not everything, but it often makes an apparently dull article almost vivacious. The only safe rule, for amateurs and professionals alike, is to challenge every sentence and paragraph, and to hold every adjective, adverb, and qualifying clause under suspicion. The presumption should be that each, until proved innocent, deserves capital punishment.

Public Library
PROFESSOR LANGDELL AND THE
STUDY OF LAW.

CAMBRIDGE, MASS., July 9.

The death last Friday of Prof. Christopher Columbus Langdell, at the age of eighty, terminates a career which is singularly complete and triumphant, and which must receive careful attention in any history of law or of education. Born in 1826, in the little New Hampshire village of New Boston, he was educated, largely by means of money he himself earned, at Phillips Exeter Academy, Harvard College, and the Harvard Law School. Thereafter for nearly twenty years he practised law in New York, known to few besides the lawyers by whom he was largely employed. It was not until 1870, when he had reached the age of forty-four, that he found his great opportunity. In that year

he became Dane Professor of Law and Dean of the Law Faculty of Harvard University; and from that time until now there has been a Langdell system of study, and to describe or attack or defend that system has been one of the most frequent undertakings of law students and of law teachers. For a generation, no professor's name has been more widely known. Lately the discussions have been less heated, and perhaps less numerous, than formerly; but even now the question most often and most pressingly asked as to any law school is whether it uses the Langdell system. Professor Langdell himself spent no time in disputation. He simply devised the system, used it, and was content to let results test the correctness of his theory.

To introduce a new system of study at the Harvard Law School in 1870 was an act of great bravery. The school had been in existence for half a century. It was in great repute. Its professors had produced treatises which held, and still hold, a high place in the esteem of the profession. Even laymen have heard of the works of Story, Greenleaf, Parsons, and Washburn. Their productions had been largely the fruit of class-room lectures. By the method of instruction then current the student listened to lectures and read treatises; and, in order that the task might not be merely the memorizing of generalizations made by the lecturer or the text writer, some instructors devoted much time to discussing concrete problems. Many men are still living who know that the work of those old days must not be treated disrespectfully; but Professor Langdell, though trained in the method then current, was of opinion that he knew a method more scientific, more thorough, and better fitted to produce successful lawyers. He knew—as, indeed, every law student learns in the first week of his studies—that the existence and limits of a rule of law must be proved finally, not by a text-book, but by the reported decisions of courts. He knew that when a lawyer has occasion to test a rule of law he searches for those decisions. Professor Langdell determined that the student should be trained to use those original authorities, and to derive from judicial decisions, by criticism and comparison, the general propositions which text-writers, if they do their work conscientiously, find in the same manner; that, in other words, the student should not be fed with predigested food. The plan, as worked out, was that the instructor should reprint from the reports the cases adapted to show the growth of legal doctrine; that the student should master five or six cases in preparation for each class-room exercise; and that the exercise should consist of stating and discussing these cases and solving related hypothetical problems. However easy it may be to-day to see that this plan is reasonable, in 1870 it appeared to many persons, and indeed to most, impracticable and unscientific. The fact seems to be that this was an extremely early attempt to apply the inductive method of the laboratory to matters foreign to the natural sciences. To Professor Langdell it seemed the most natural plan possible. He had devised part of it in his own student days. He understood himself to be simply applying to the student stage of the lawyer's life the method established from time im-

memorial as to the work of the practitioner and the judge. On the title page of his first collection of cases, he tied himself to the past by quoting words written by Coke two centuries earlier: "It is ever good to rely upon the book at large, for many times *compendia sunt dispensia*, and *melius est petere fontes quam sectari rivulos*."

After Professor Langdell began the new plan, to persevere with it required further courage; for the majority of students, teachers, and practitioners showed only too clearly that they considered it foolish and almost sacrilegious to lay aside old methods and the time-honored treatises. Many years passed before the new system was adopted unanimously by Professor Langdell's colleagues. Meanwhile the Harvard Law School was bitterly attacked upon the supposition that this was the only method used; and in consequence, the attendance remained nearly stationary, being saved from serious diminution by nothing but the increase in the attendance upon Harvard College, and in the resort of Harvard graduates to the law school. About 1890 there came a great change. Almost simultaneously the Harvard Law School began to grow and the Langdell system began to spread to other universities. Today, Professor Langdell's triumph is complete. Time has demonstrated that persons trained under his system are sound and successful lawyers. That system is now the only one employed at Harvard. Most of the other law schools use it, wholly or partly, or some modification of it; and those which cling to old methods find it advisable to insert in their announcements argumentative matter to the effect that they combine with the old methods some features of the method discovered by Professor Langdell. The law schools employing the new system, wholly or partly, in its unmodified form, are distributed widely; and leaving out of the account States in which there are no law schools at all; one might have traced for Professor Langdell a triumphal progress from the Atlantic to the Pacific, passing exclusively through States in which at least one law school professedly uses his system.

To present, even inadequately, the chief facts as to Professor Langdell's greatest achievement has rendered it impracticable to enumerate his other services. Yet it must not be forgotten that for twenty-five years he was the Dean of the Harvard Law School, administering numerous duties with justice and with painstaking attention to detail; that he did much to promote the vast growth of the Harvard Law Library; that he produced four selections of cases, pioneer volumes made with great labor; and that he wrote three treatises, unsurpassed for accuracy, originality, and clearness. It should be added that his system of study has required teachers of law to do work of greater thoroughness and has thus aided to create, as a sort of by-product, the dignified career, now pursued by ten times as many persons as in 1870, of the professional teacher of law.

This remarkable record has been recognized at Harvard in ways that are obviously not perfunctory. In 1895, when Professor Langdell resigned the deanship, there was a great assembly of Harvard Law School graduates in his honor. In 1900, when he resigned the Dane professorship, the

Harvard corporation appointed him Dane Professor of Law, *Emeritus*. In 1903, the corporation named in his honor a Langdell professorship—an unprecedented compliment for Harvard to pay to a man still living. In 1906, the corporation assigned to the additional building for the law school the name of Langdell Hall; and when this building is completed it will be the only university building bearing the name of a professor.

And the man himself? Guileless, and shrewd; grave, and cheerful; modest, and fearless; not given to speech; persistent in the search for truth—on the last day of his life, though oppressed by infirmities, doing a full day's work; in short, the man's whole nature harmonized with his rank as a great master. To do justice to the rare genius just now gone, it is not necessary to speak slightly of others. Has some other American, in any branch of knowledge, overthrown an established system of study and replaced it, in his own university and elsewhere, with a new and useful system so thoroughly identified with him that men call it by his name? If so, let the name of the man who has performed that brave and laborious service be placed beside Professor Langdell's at the head of the list of American scholars.

EUGENE WAMBAUGH.

A GREAT MUSEUM BUILDER.

Henry Augustus Ward, A.M., Sc.D., LL.D., to whom the scientific museums of America owe more than to any other man, was killed by an automobile at Buffalo, July 4. The world has its professors of zoology, its doctors of science and its curators, but it has had only one maker of museums in the class of this remarkable man. He was a unique personage, and, viewed to-day in the perspective which a third of a century can give, his genius and his works bulk large.

In the ordinary sense, Professor Ward was neither a scientific investigator, nor a college professor. In these lines he did not aspire to distinction; but his formal title he acquired properly during the five-year period when he was a member of the faculty of Rochester University, and there taught the natural sciences. His life was devoted to culling scientifically and accumulating the choicest objects for illustration of the processes of nature, to converting them into museum specimens, and finally to building museums. With him the idea of educating the masses in the natural sciences by means of object-lessons became an absorbing passion. He cared for money only to spend it in wider travel and more collections; and while he found purchasers for great collections as no other man ever did, the huge checks which he received he always joyously scattered to the ends of the earth in the purchase of more "museum material." The Field Columbian Museum was born in the Chicago Exposition, when Marshall Field handed to Professor Ward a check for \$100,000 in payment for the Ward collection of zoology, geology, mineralogy, and paleontology there exhibited. At the University of Virginia the Lewis Brooks Hall of Science was designed by Professor Ward, erected under his direction, and filled in one grand *coup* from the splendid

cabinets of mounted specimens in Ward's Natural Science Establishment. For the collections alone, Mr. Brooks, a Rochester philanthropist, paid Mr. Ward about \$75,000.

Professor Ward was born in 1834. While a student at the School of Mines, in Paris, he became specially interested in fossils. From a knowledge of scientific value to an understanding of the money value of museum varieties was an easy step. As a good newspaper-man has a nose for news, so had he a nose for fossils; and he was born to travel. European naturalists went about comparatively little in those days, and the English Channel was as wide as the Atlantic now. Finding that certain fossils of the Continent were salable in England at good prices, he thought to pay the expenses of a visit to the London museums with a satchelful of specimens. The venture proved highly fortunate, and in a short time the young naturalist was astounded by his own success in bringing rarities to those who were ready to pay for them, even while he wondered at the dulness of his patrons, as collectors. Certain excavations then being made for wine cellars in the champagne belt of France, on the estate of Madame Clicquot, yielded to the hustling student a rich harvest of fossils which found ready sale all over Europe. And so he went on, adding to his collections and his reputation.

Professor Ward's most notable achievement as a scientist and educator was, in my estimation, the colossal task which culminated in the Ward Collection of Casts of Celebrated Fossils. While yet in his twenties, he was deeply impressed by observing the manner in which the vertebrate fossils of greatest scientific value were widely scattered through museums of Europe. He saw that for American students to visit all those places was impossible. How could fossils be made available to investigators and the general public in America? Thus he conceived the idea of painted plaster casts, made in America from moulds owned by him, and available to all the world. Then began the long-continued effort to secure the moulds desired. In this undertaking he encountered endless difficulties, the most serious of which was the strong disinclination of many museum officers to permit the copying of their most cherished zoological treasures. To meet obstacles of this character he displayed the utmost diplomacy, and made the strongest appeals in the sacred name of science. In the end the enthusiast won, and his victory has been of priceless value to American students. Poor indeed is the college or university museum which does not contain a series of "Ward Casts." About two hundred sets of them have, I think, found lodgment in the museums and higher institutions of learning in this country. The most noteworthy objects are the great megatherium, the dinothereum, the glyptodon, colosochelys, mastodon, and elephas ganesa.

For at least twenty-five years the enormous extent of Professor Ward's museum-making industry at Rochester has been to every new visitor a source of wonder. Every department (it occupies fourteen buildings) is on a scientific basis. Fortunately, Professor Ward's enterprises always had the financial support of his family,

notably his late uncle, Levi A. Ward, and his cousin, Frank A. Ward. Although the establishment has never produced noteworthy profits, in the last period of stringency several wealthy citizens of Rochester decided that an institution which had shed such lustre upon the city should not be permitted to perish from lack of capital; and the money for its permanent foundation was paid in to a stock company organization.

Henry A. Ward was the first American to take up the making of museums in a systematic and scientific manner. The collection which he finished about 1870, and placed for the citizens of Rochester in the museum of Rochester University, may justly be regarded as having set the pace. Even after a lapse of a third of a century, it is a good object lesson to aspiring museum-builders, a collection to study and admire. Another service of inestimable importance, which Professor Ward rendered to science in America, was his study of the finest museums of Europe, the method of their development, and the possible improvements. As early as 1873, when the best of our scientific museums were only in their swaddling clothes, and skilled museum preparators were a negligible quantity, Professor Ward assembled at Rochester a corps of the best French, German, and American taxidermists, osteologists, moulders, and modellers, that high wages could procure. In 1876 I was astonished at finding that Rochester afforded better facilities for the study of museum-making than Paris, London, or Berlin.

Through his coöperation, Professor Agassiz was enabled to fill the Museum of Comparative Zoölogy at Harvard, before any other American museum had more than begun to take notice. To-day the "men from Ward's" are much in evidence in the large museums of this country; and the severe training which Professor Ward bestowed upon his young naturalists is producing its proper results in scientific object-lessons of high character for Washington, New York, Brooklyn, Chicago, Pittsburgh, and Milwaukee. In New York the directors of the Brooklyn Institute Museum, the New York Aquarium, and the Zoological Park are men who graduated at "Ward's" in the early days.

About eight years ago, Professor Ward married Mrs. Lydia Avery Coonley of Chicago, and relinquished the detailed management of the Rochester establishment. After that, he devoted much time to completing his collection of meteorites, which for nearly twenty years has been a favorite interest. He brought it to a remarkable state of perfection, in comparison with the world's best meteorite collections, and about two years ago installed it for temporary exhibition in the American Museum of Natural History, where it is to-day. His last literary work was the publication of an elaborate annotated catalogue of the collection, a model of its kind.

At the age of seventy, Professor Ward went to Canada, and selected a particularly fine rock "specimen" to mark his last resting place. A massive and shapely boulder of porphyry was brought to Rochester, erected on a prominent knoll in Mount Hope Cemetery, and his name was sculptured upon its face. Except for the chiseled inscription, the rock is as it came

from nature's workshop. This last task of the always-forehanded man of science was not completed a day too soon. Thus passes from life a man whose services to science and also the unscientific millions were great, but understood and appreciated by those only who knew him best and longest. In one sense, the Lewis Brooks Hall of Science at the University of Virginia is his best material monument, for the reason that he made it all, and it stands alone. From 1870 to 1895 he was the man for the hour, the birth hour of many new museums, the renaissance of old ones. He wrought with high purpose; he lived to see the fruits of his genius and his labors; and in his peculiar field he leaves no understudy.

W. T. HORNADAY.

BIBLIOGRAPHICAL SOCIETY.

The annual meeting of the Bibliographical Society of America was held at Narragansett Pier July 2, President William C. Lane, librarian of Harvard University, in the chair. The secretary, C. Alex. Nelson, announced that after long delay caused by the printers' strike, vol. i., part i., of Proceedings and papers of the society for 1904-5 had been published and distributed to members. The secretary also announced the publication of the Minutes of the Common Council of the City of New York down to 1776, in eight octavo volumes, with a full index. John Thomson reported that the list of incunabula in American libraries compiled by the committee contained about 5,000 different titles, and would make a volume of more than 500 pages. This list the society proposes to publish in two parts, and to issue to members as its publication for the years 1906-7. Messrs. Lane, Kates, and Nelson were appointed a committee to secure a guarantee fund for the publication.

W. D. Johnston, of the Library of Congress, read a paper on the bibliographical work of the late Henry Carrington Bolton, his bibliographies of special subjects in chemistry, the two editions of his Catalogue of Scientific and Technical Periodicals, published by the Smithsonian Institution, his versatility in the treatment of such varied subjects as the counting-out rhymes of children and the study of musical sands. Dr. E. C. Richardson followed with some personal reminiscences of Dr. Bolton.

C. W. Andrews of the John Crerar Library, Chicago, took up the question of Union Lists of Periodicals. The secretary then read a brief paper on exactness and completeness in bibliographical work, written by Victor H. Paltsits of the Lenox Branch of the New York Public Library. J. C. M. Hanson of Washington discussed the cataloguing of early Americana prior to 1800, suggesting improvement and uniformity in this class of work. The subject was referred to a committee consisting of Messrs. Hanson, Legler, Bain, Winship, and G. W. Cole.

The secretary read a paper by Dr. Robert Fletcher on the "Index Catalogue of the Surgeon-General's Office," giving its history and a sketch of the method pursued in carding and indexing books and periodicals for that catalogue. A paper by Dr. P. R. Uhler on the "Origin and Development of the Peabody Institute Catalogue" was read by title. The president called attention to

sample pages of the A. L. A. Portrait Index, now all in type, and explained the methods of arrangement adopted. The new form of publishing the list of copyright entries at the Library of Congress was also noted as a valuable piece of systematic bibliography.

In response to a call for suggestions as to the next piece of work to be published by the society the following were offered: A Bibliography of Codices, and a Coöperative List of the Periodicals at six or more great centres, by Dr. E. C. Richardson; a Bibliography of Early American Periodicals, by W. J. James. R. G. Thwaites reported that Prof. W. B. Cairns of the University of Wisconsin has such a list in preparation; he also announced the completion of a manuscript index of historical material in the libraries of Wisconsin, which would be put into print. James Bain of Toronto spoke of the work undertaken by the Champlain Society of Canada, which proposes to publish this year the first volume of the English translation of Les-carbot, and a catalogue of documents connected with seigniorial tenure in the Province of Quebec. He had been invited to collate and edit a bibliography of Canada based on the manuscripts in the larger libraries of Quebec, Montreal, Ottawa, and Toronto. It was proposed to cover the period from 1700 to 1900. He spoke also of a new Bibliography of F. Mesplets, the first printer in Montreal, which is being prepared by Mr. McLachlan of that city. At a meeting of the Council, W. D. Johnston was requested to survey the field and report on the possibility of preparing a record of current bibliography.

The following officers were elected for the ensuing year: President, W. C. Lane; vice-presidents, R. G. Thwaites, E. C. Richardson; secretary, W. D. Johnston; treasurer, Carl B. Roden; librarian, Wilberforce Eames; councillor for four years, C. Alex. Nelson. The next meeting of the society will be held at Providence in December, in connection with the annual meeting of the American Historical Association.

JUNE PUBLICATIONS IN PARIS.

PARIS, June 29.

The Paris custom has it that new books published in June, the season's end, are either light and may be bought up for vacation reading, or they are heavy and must rely on a slow and steady sale rather than immediate success.

Of original works on history, there is a continuous flow, ever since students have had the chance of poring over contemporary documents. M. Ernest Lavisse of the French Academy has taken for himself the reign of Louis the Fourteenth, in the many-volumed "History of France," which he is editing for the house of Hachette. His first volume ("tome vii., fascicule 4," of the entire History) comprises the years 1643 to 1685—the Fronde, the King, Oclbert. It is worth noting that M. Lavisse's "Youth of Frederick the Great"—the work which made his name and began his influence over the serious university men of the last generation but one—also appears in a fourth edition, which may be little for a popular novel, but is something for sober foreign history.

M. A. Luchaire, who had the years 987 to

1226 in M. Lavisse's History, brings out the third volume of his own "History of Innocent the Third"; it deals with the Papacy and the Empire, the previous volumes taking Rome and Italy and the Albigense Crusade. M. Luchaire is more than a trained investigator of original sources; he has a broad-minded interest in the events which he takes so much pains to narrate from contemporary documents—a view of history reminding the English reader of the late Lord Acton. In spite of their tried Liberalism, which would have been thought beyond dispute in the eighties of the last century, the critics of this new age find both M. Lavisse and M. Luchaire "reactionary"!

M. Emile Roca, from the anecdotic gleanings now so much in favor, and so much disliked by Herbert Spencer, goes on in his *Grand Siècle Intime* to the "Reign of Richelieu (1617-1642)." The Vicomte de Noailles gives us episodes in the Thirty Years' War in a volume from contemporary sources on the Lieutenant-General of the King's armies—no less a personage than Cardinal de La Valette, the militant archbishop of Toulouse, whom his own father nicknamed Richelieu's "cardinal-valet"; he seems to have been a poor general. The fifth descendant of Louis the Fourteenth's "surgeon and confidant," Georges Marschal, writes the documentary history of his ancestor with savory details of the Grand Monarque's bedroom.

A limited public may be found for the Critical History of the Preaching of Lord Brougham's favorite orator—the Jesuit Bourdaloue—from the notes of his hearers and contemporary testimony; E. Griselle, Docteur-ès-Lettres, publishes the third volume of 500 pages. In Hachette's series of Great French Writers, M. Bossert takes up Calvin, whom we are scarcely accustomed to consider from the literary point of view.

It is hard to follow the deluge of publications concerning the French Revolution, few of which are valueless. Of original documents, we have at last the Private Correspondence of that duke and peer of France who put himself at the service of the Revolution, not without being called the secret agent of Philippe Égalité—the Duc de Lauzun, whom the revolutionists knew as Gen. Biron. After a youth of Louis Quinze dissipation, he fought in our War of Independence; but neither this nor his revolutionary exploits in France kept the tribunal of the Terror from cutting off his head. These letters are from the years 1791-1792; the Duke's Memoirs, published in 1822, with doubtful editorship, ended with the American war.

M. G. Lenôtre in the third series of his "Old Houses, Old Papers," gathers together the entertaining chapters of Revolutionary personal history, which he has been publishing in periodicals. The story of Santerre, the executioner of Louis the Sixteenth, in his later years, and the death of Roland (the husband of madame) are among the interesting pieces, but by no means the most adventurous and thrilling. The new, and this time authentic and complete, publication of all that concerns Madame Roland will shortly render a true life of that heroine possible, but not easy, considering the thousands of letters from her tireless hand. She comes up again with M. Lenôtre in his stirring picture of

the end of her friends, the tracked Glron-dists.

The immense "Histoire Socialiste," from the years 1789 to 1900, directed by that limitless word-outpourer, M. Jean Jaurès, is not perhaps receiving the attention it really merits. It is clearly impossible that the writers of the various volumes should be considered authorities at first hand; in fact, most of them are members of Parliament. But they are the controversialists of the new Church; and this implies, not only deep familiarity with all objections to their views of events, but also a strong corps of faithful students to supply them with the documentary knowledge required. They may be said to give out to the general public the results of laborious studies made by such esteemed scholars and co-religionists as Professor Aulard. Two more large volumes appear this month—the seventh of the series on the Restoration (1814-1830), by M. Viviani, the able and combative Independent Socialist, whom the late elections have brought back to the Chamber of Deputies; and the eighth on the Reign of Louis Philippe (1830-1848), by M. Eugène Four-nière, also a Socialist deputy, whom the Government some time since appointed historical lecturer at one of the great military schools. M. Jaurès himself fathered the four first volumes, from the beginning of the Revolution to the Terror, inclusive; M. G. Deville, Independent Socialist deputy, took the volume on Thermidor and the Directory; and M. Paul Brousse, one-time Communist and disciple of Bakunin, father of anarchy, later president of the Paris Municipal Council, and now Socialist deputy, had Consulate and Empire, with M. H. Turot, a Socialist editor. These qualifications of the authors may have averted the eyes of solid students from the work, but it contains the sound form of words and views which the children of the French Revolution now accept in regard to their fathers. The series is neither the least interesting nor the least profitable of the histories of the epoch-making Revolution, which have been attempted since the opening up to research of all the documents in the case.

M. Ernest Denis, who is favorably known for his books on what is contemporary history for the elders among us, has an important work, if only from general readability and its presentment of the French point of view, "Foundation of the German Empire" (1652-1871), 540 pages. M. André Siegfried, son of the member of Parliament, has a careful study made on the spot, also from the enlightened French point of view, on "Canada, the Two Races"; it helps to give general views about history in the making near home.

Of lighter books which may be read out of France, Henri Gavedan, the Academician, has a new novel, "Le Bon Temps"; and Jean Ajcard, who has so long been waiting just outside the Academy doors, publishes "Benjamin." The delightful narrator of the Simple Life in French provinces, M. Emile Guillaumin, announces a new book, "Albert Marceau, Adjudant," and Albert Bolssière, in a novel "Jolie," continues his smiling mystifications. S. D.

Correspondence.

THE FRESCOES AT ANAGNI.

TO THE EDITOR OF THE NATION:

SIR: I should like to obtain what information is possible concerning the frescoes in the crypt of the Duomo at Anagni. I cannot succeed in finding any literature upon this highly interesting work; and I understand by personal inquiry at Florence and Rome that there have been made no photographs obtainable by the public of these early examples of religious painting. An examination of them which lasted several hours last year inclines me to the belief that if they have not been carefully studied, some one properly qualified ought to make a detailed study of them. The fact that they seem to be quite untouched, and yet are strikingly fresh in preservation, increases their interest. The historical importance of Anagni and its central situation make it seem almost impossible that these frescoes have not been worked over by some specialist who has published his researches in some particularly inaccessible place.

T. D. B.

Cambridge, Mass., July 6.

ANOTHER TEST OF GENIUS.

TO THE EDITOR OF THE NATION:

SIR: Werner A. Stille's plan for testing the reasoning powers of candidates for "schools for geniuses" by proverbs or parables, is not a bad one, and has at least the merit of definiteness. Certain psychologists nowadays lay such stress on the relation between genius and madness that a teacher on the lookout for extraordinary mental manifestations in his pupils must sometimes be puzzled by the vagaries of precocity. And while you can never be sure that your musically, rhetorically, mathematically, or artistically gifted boy really harbors genius, neither, on the other hand, is it safe to predicate dullness of your shy and non-studious scribbler of immature verse, who hates the sciences or is deaf to music and blind to art. Make it thus possible for the perplexed teacher, if not to detect genius with absolute certainty, at least to keep out patent mediocrity. For this purpose a judgment test of some kind may be useful.

It may interest Mr. Stille to learn that more than forty years ago a newly installed teacher of German, at one of the schools of Vienna, with the evident intention of gauging as rapidly as possible the intellectual equipment of his new pupils, gave them a list of synonyms to define. It may safely be said that any boy, whether candidate for a school for geniuses or not, who can emerge from such a test creditably, has at least reasoning powers that are worth cultivating. I cannot imagine an essay on any subject that will so clearly give promise of future ability and usefulness in certain directions, as a successful definition of, let us say, these three simple synonyms, "affluence," "prosperity," "wealth."

But, it will be asked, is the teacher in search of genius materially helped by a process which merely draws a hard-and-fast line between the dull and the bright? Unhappily the experiment of the Vienna

pedagogue proves nothing decisive. The best definitions in the synonym test were furnished by a boy considered up to that time one of the most backward of his class, slow of comprehension, morose, and altogether unpromising. He subsequently showed some literary aspirations, but failed to make a mark either in literature or in anything else. The genius of the class, a boy of remarkable artistic gifts, acquitted himself wretchedly, as always in his grammar lessons. He became not an artist, but a blacksmith. Of the class as a whole, not a few attained distinction in after life. Two of the pupils became well known literary men, one of them is the author of a play which in an English adaptation is frequently seen on the American stage; but neither of the two, as far as memory serves, gave the slightest indication of literary ability either at the test-examination mentioned or on any subsequent similar occasion. Perhaps the discerning teacher will wisely limit himself to the fostering of talent and let genius find its own way. In the language of Grillparzer:

Denn das Genie, es läuft in allen Gassen,
Doch seltener als je ist das Talent.

New York, July 5.

G. P.

Notes.

E. P. Dutton & Co. will publish immediately "A Child's Recollections of Tennyson," by Edith Nicholl Ellison; "Court Life in the Dutch Republic, 1638-1689," by the Baroness Suzette Van Zalen Van Nyvelt; "Sigismonde Malatesta," by Edward Hutton; "The Memoirs of the Lord of Joinville," a new English version by Ethel Wedgwood; "Garden Graith, or Talks Among My Flowers" (a tenth edition), by Sarah F. Smiley; "A Benedick in Arcady," by Halliwell Sutcliffe; "Dearlove: The History of Her Summer's Make-Believe," by Francis Campbell; "Truth and Falsehood in Religion," by William Ralph Inge, M.A., D.D.; "Saint Bernardine of Sienna," by Paul Thureau-Dangin; "Joseph Priestly," by T. E. Thorpe, F.R.S., in English Men of Science Series; and "Trinity College, Cambridge," by W. W. Rouse Ball, in the College Monograph Series; "The Shores of the Adriatic, the Italian Side; Architectural and Archaeological," by F. Hamilton Jackson, R.B.A.

The second volume of the *Harvard Psychological Studies*, edited by Prof. Hugo Münsterberg, appears with the imprint of Houghton, Mifflin & Co., who will henceforth be the regular publishers of it. The subscription price is \$4 net.

The Oxford University Press has ready a history of "The Great Revolt of 1381" by Professor Oman. The late André Reville had projected a work on this movement, and had got together a vast collection of records of trials, inquests, petitions, and escheators' rolls for this purpose. Professor Oman has enjoyed the use of all these documents, and also includes some new and unpublished material regarding the poll-tax. He thinks he has discovered why that impost met with such universal detestation, how the poorer classes in England conspired to defeat its operation, and how the counterstroke made by the Government provoked the rebellion.

T. Fisher Unwin has published a volume of "Economic and Statistical Studies" by the late John Towne Danson, edited by Mrs. Norman Hill, Danson's daughter, who contributes a memoir of the author. Perhaps the most notable feature of the book is Danson's graphic illustrations of the variations in the prices of twenty-two of the principal commodities during the years from 1851 to 1890.

H. G. Wells, that rather extraordinary cross between Jules Verne and Herbert Spencer, has just finished a book based on observations made during his recent visit to this country. *Harper's Weekly* will begin its publication serially, July 14, under the title of "The Future in America."

The five separate books of Bliss Carman's "Pipes of Pan" are now bound together in a single volume and issued by L. C. Page & Co.

Henry Holt & Co. announce a fifth edition printing of Prof. Henry A. Beers's "English Romanticism in the Eighteenth Century." The book undoubtedly holds its popularity rather from the bits of excellent individual criticism scattered through its pages than from any philosophical grasp of the romantic movement as a whole.

From Armand Colin, Paris, we receive "Elaine," by Gabriel Franay, the delightful author of "Mon Chevalier," which was crowned by the French Academy and received a Montyon prize. "Elaine" is the sequel of "Axel," being the second part of "Comme dans un Conte." If not exactly the kind of book which French people are supposed to put into the hands of young girls, it is at least as innocent and considerably more refined than stories often given to the girls of Sunday schools. Hans Christian Andersen is one of the prominent characters; and his well-known poetical and light fancies will delight the reader. The heroine is a courageous yet delicate type of a certain class of young Frenchwomen, and is a sympathetic figure. The plot of the romance is original, and the touching story ends in a thunderbolt of tragedy. *Per contra*, in many chapters, such as that in which the children meet for a sleigh-ride to a Christmas-tree, the author's genius shines gayly, with lively wit.

We have already spoken of the English version of Sabatier's "Séparation des Églises et de l'État." Those who prefer to read this author in his own tongue should resort to the third, revised and enlarged edition which just comes to us from Fischbacher in Paris.

"Bibliotheca Romanica" is the name of a new undertaking in bookmaking by the press of J. H. Ed. Heitz, in Strassburg (Germany), which deserves attention in America, where similar series, like the Bibliotheca Teubneriana of Greek and Latin authors, the Tauchnitz Collection of British and American authors, or the collections in German by Reclam, Meyer, Hendel, and Hesse, are well appreciated. It is somewhat supplementary to these series, in that it purposes "to make accessible to scholars, students, teachers, and persons of culture of the world at large, in reliable editions in the original languages, and based on first-hand editions, those works of the French, Italian, Spanish, and Portuguese literatures of all ages, which are of

accepted classical or international importance, as well as such other works from these literatures as are of interest for their literary value or for the history of civilization." The twenty-two numbers so far issued include works by Molière, Corneille, Racine, Descartes, Dante, Boccaccio, Petrarca, Calderon, Camoëns. We are glad to find among these representative writers two of less renown, Restif de la Bretonne and Claude Tillier. The former, who is an important and interesting forerunner of Balzac and Zola, and whose life and writings have just been treated in a monograph by Eugen Dühren (Berlin, 1906), is represented by a drama, "L'an 2000," reprinted after a rare edition of Neufchâteau in 1790. The reimpression, from the original edition of 1843, of Tillier's "Mon oncle Benjamin" is especially meritorious. The subtle humor of this book has brought about its great popularity in Germany and Scandinavia (there are three German translations), although in France it appears to be in no special favor. It has, like all the other works so far edited, an introduction by Gustav Gröber, professor of Romance Philology at the University of Strassburg, well known as the editor of the "Grundriss der romanischen Philologie." The textual supervision and the short but comprehensive introductions (always in the vernacular of the work commented on) as well as the carefully selected variants given below the text (cf. Dante's "Inferno," "Rime de Petrarca," Molière's "Misanthrope"), coming from such an authority, make those handy, well-printed little volumes a delight to both the scholar and the general reader. The size of the book is about that of Hoepli's manuals. They are unbound, so as to enable the buyer to have numbers bound together in such combinations as may suit his taste. The price of each number is 40 pfennigs, or 10 cents.

The first instalment of an encyclopedia of a character and scope as unique as it is vast in its conception, is brought out by the firm of B. G. Teubner, Leipzig. Its title, "Die Kultur der Gegenwart, ihre Entwicklung und ihre Ziele," shows that it is intended to be not only a dictionary of culture, but also to emphasize the problematic sides of our civilization and its vital tendencies. Four great divisions will embrace what the Germans call *Geisteswissenschaften*, *Naturwissenschaften* and *Technik*, the two latter forming the third and fourth divisions; while the *Geisteswissenschaften* form the first and second, subdivided into General Foundations of present civilization (*Kultur*), Religion, Philosophy, Literature, Music, Art, and into State, Society, Law, Economics. Two volumes have been completed so far, the one on the Greek and Latin Languages and Literatures, the other on Christian Religion, including the Israelitish-Jewish Religion.

In "The Biology of the Frog" (The Macmillan Company, \$1.60), Prof. S. J. Holmes of the University of Wisconsin has brought together from reliable sources a large amount of useful information as to structure, development, functions, and behavior of the inoffensive, common, and convenient amphibian which, as Jeffries Wyman used to say, seems to have been created for teachers and students of physiology, his-

tology, and certain sides of anatomy. In this, however, as in most works of the kind, there is too little recognition of the fact that, in many respects, the frog, like man, is a morphologic monstrosity; our author, indeed, does not even comment upon the secondary fusion of the olfactory lobes, a misleading condition fortunately rare among vertebrates. The first chapter includes a somewhat too condensed account of the entire class, and the initial paragraph furnishes numerous illustrations of the difficulty of formulating characters that are at once constant throughout a large group and peculiar to it. There is little evidence of original work, but the writer has probably verified most of the statements. The illustrations are clear and mostly from standard works. Fig. 4 is credited to "Wilder"; it should be Harris H. Wilder (of Smith College), and the name should be in the "Index of Authors"; there should likewise be some reference to his observations on the "lungless salamanders." Certain points might easily be criticised, e. g., the representation of the European *Proteus* rather than the American *Necturus*, and the detailed account of a European salamander rather than of a native form. Typographic errors are commendably few, the most notable being the uniform injection of a c into *Wiedersheim*.

A book of five hundred and thirty-six pages, entitled "Consumption: Its Relation to Man and his Civilization, its Prevention and Cure," by John Bessner Huber, M.D. (Philadelphia: J. B. Lippincott Co.), well fulfils the aim that the writer sets for it, of placing before the public, in not too technical a form, the facts with regard to tuberculosis and the efforts which are being made for its prevention and eradication. Every third or fourth adult, the writer says, dies of consumption, and the problem of how to make headway against such an enemy is one which not physicians alone, but all thoughtful men, are called upon to meet. The book is written with spirit and should be widely read. The style is a little diffuse, but as a whole this is a good and timely piece of work.

The *Museums Journal* for May contains the discussion on the papers read at the Museums Association's conference at Worcester, last year, dealing with the "Relation of Provincial Museums to National Institutions." The papers themselves have been printed in earlier numbers. John Minto, in the opening address, offered an able presentation of the whole problem, which is, he said, "how our museums, both provincial and national, may best be utilized as factors in our national system of education." A national museum unavoidably contains a large number of duplicates which could well be utilized in a loan department for the benefit of provincial and local museums; and the speaker suggested that the British Museum institute such a department to work in cooperation with the circulating department at South Kensington. A local museum should store and exhibit specimens of local flora, fauna, geology, ethnology, antiquities, industry, and, in addition to these, typically characteristic specimens. Mr. Minto found that comparatively large space is given to the articles shown, compared with that taken to explain what is shown. He also raised

the questions of increased Government aid to museums and of the desirability of their closer coördination with other educational forces, perhaps under one local educational authority. The discussion turned chiefly on the question of extended Government aid and consequent inspection. Attention was called to the development of museums in the United States as the result of individual energy, but most of the speakers agreed that the Government could indeed give a great impetus to the development of local institutions by aid in many ways, especially by employing, in connection with the central museums, a number of experts in various lines who could go out, as a sort of peripatetic curators, and assist the curators of smaller museums. W. W. Watts of the Victoria and Albert Museum remarked that it did not seem to be generally known by museum curators what that institution was really doing to aid smaller museums, one of its fundamental features being to offer loan collections, grauts of money, and expert advice. "Any information gained at South Kensington by specialists was at the disposal of any properly constituted municipal authority."

A more cosmopolitan boys' high school than Victoria College at Alexandria, Egypt, it would be difficult to find. Out of a total of 186 pupils, said Lord Cromer at the laying of the foundation stone of a new building, 30 are Christians, 67 are Israelites, 39 are Moslems, while of different nationalities there are Egyptian, Turkish, Syrian, Armenian, Maltese, Greek, English, French, Italian, Spanish, Dutch, Swiss, and Belgian pupils. The object of the institution is to provide for the upper classes in Egypt of all nationalities and creeds a school for the education of their sons, which will, as far as possible, follow the lines of an English public school. After commending its value as an educational institution he closed his address with the expression of the hope that the college would help towards the political and social fusion of the various races who inhabited the valley of the Nile, an end to which the efforts of all true Egyptian reformers should be directed. Religious instruction is given at the request of the parents who desire it, by teachers whom they have themselves chosen.

Dr. M. A. Stein, whose archæological researches in Eastern Turkestan in 1900-1 were so successful, is on his way to the same region at the head of a mission sent out under the auspices of the Indian Government and the British Museum. It includes a trained native surveyor for geographical work, and is equipped for a period of two years. He hopes that by further excavations in the desert ruins he will be able materially to add to our knowledge of the ancient inhabitants and their history. His previous investigations showed for the first time the full extent to which Indian influence had penetrated here, not merely through the propagation of the Buddhist religion, but as regards language, material culture, and art. They also demonstrated that the influence of the Classical West had reached this part of Central Asia during the first centuries of the Christian era. In Chinese Turkestan Russian and German scientific men are at work, and a French archæological ex-

pedition is about to start to pursue investigations from Kashgar to Peking.

A scientific expedition to the Melanesian Islands is strongly advocated by Dr. A. C. Haddon, F.R.S., having for its main object the investigation of their anthropological problems. Among these are the causes which led to the transition from mother-right to father-right and the different stages of its progress, the evolution of the family, and the distribution and inheritance of property. Melanesia is also a favorable area for tracing the emergence of government. It is only by the careful regional study of restricted areas—and there are many districts in the islands never yet visited by a white man—that the real meaning of the institutions and their metamorphoses, as well as of the many religious beliefs, can be understood. This work of studying the psychology of backward peoples has been greatly neglected, and there should be no delay in sending out this expedition, as changes are rapidly taking place among the natives which tend to modify or destroy the old customs. Much has already disappeared in many places, but we are yet in time in many others. As a part of the equipment he proposes a cinematograph for recording the dances and ceremonies of the natives. He closes his appeal, made before the Royal Geographical Society, with an expression of his hope that American investigators may be led to join in these researches.

At the annual meeting of the London Library, June 14, the president, Arthur Balfour, said that its main object was still the same as that which led Dean Milman, Sir G. C. Lewis, Gladstone, Carlyle, Henry Hallam, and other eminent men to found it sixty-five years ago. It was to provide a place, not for spending an idle hour agreeably, but for the purpose of historic, scientific, and philosophical research. In some respects, as in the department of foreign literature, it excelled all other English libraries, even that of the British Museum. To aid in this research work a catalogue of subjects was being prepared for its quarter of a million volumes. The value of this catalogue in giving the sources of all available information on any subject was, he believed, quite incalculable. Lord Curzon said that he had been so impressed with the advantages of the library that he had succeeded in creating in Calcutta an institution which endeavored to combine the features of the library with the reading room of the British Museum. The circulation of books for the past twelve months was 129,748.

Walter Jerrold sends to the *Athenæum* two brief poems by Charles Lamb which have hitherto escaped the collectors of Eliana. One is a stanza signed C. L.—b, which appeared in the *Mirror of Literature, Amusement, and Instruction* for June 1, 1833. As it is indexed "Lamb, C., lines by," there can be no doubt of the authorship. It is as follows:

FROM THE LATIN.

As swallows shrink before the wintry blast,
And gladly seek a more congenial soil,
So flatterers halt when fortune's lure is past,
And basely court some richer lordling's smile.

In the same periodical for May 7, 1836, Mr. Jerrold has found the following:

C. LAMB.—The following lines were written by the late C. Lamb upon the cover of a book of blotting paper.—F. W. L.

Blank tho' I be, within you'll find
Relics of th' enraptured mind:
Where truth and fable, mirth and wit,
Are safely here deposited.
The placid, furious, envious, wise,
Impart to me their secrecies;
Here hidden thoughts in biotted line,
Nor sybil [sic] can the sense divine,
Lethe and I twin sisters he—
Then, stranger, open me and see.

Another correspondent of the *Athenæum* has settled the facts regarding Fielding's first marriage, which have hitherto eluded the search of his biographers. In the registers of St. Mary's Church, Charlcombe, this entry has been found: "November ye 28, 1734. Henry Fielding, of the parish of St. James in Bath, Esq., and Charlotte Craddock of ye same parish, spinster, were married by virtue of a licence from ye Court at Wells." Charlcombe is about two miles from Bath.

The fact that H. B. Irving has decided to make his first appeal to an American audience in the "Paolo and Francesca" of Stephen Phillips is interesting as an indication of the young man's desire to associate himself at the first, in the American mind, with the higher, literary drama, in behalf of which his father worked so successfully. The elder Irving, it is true, made his first appearance here in "The Bells," but his extraordinary performance of Mathias raised the piece to an intellectual plane far above that of the commonplace melodrama in which it was originally conceived. The son, very wisely, does not yet venture to attack that part, but he is to be seen in "Charles I." and "Louis XI.," two sufficiently bold experiments, and also in "The Lyons Mail," "Mauricette," and in two Shaksperian characters, Hamlet and Iago. The more trustworthy London critics are agreed that H. B. Irving is an actor of marked and independent ability, by no means unworthy to follow in his father's footsteps, if not quite able thus far to fill his shoes.

Robert Mantell will produce, next season, W. S. Gilbert's delightful parody of "Hamlet," "Rosencrantz and Guildenstern." He himself will appear as King Claudius. The piece has frequently been played in London and always with success. It is full of Mr. Gilbert's most characteristic humor.

The managers of the young Japanese actress Fuji-ko announce that she will soon appear in London in a one-act dream play, called "The Love of a Geisha," and the natural presumption is that the entertainment will be seen later on in this city. It is said to be the embodied idea of the doctrine of Nirvana, reduced to popular form. Illusions representative of Eastern dream visions are the work of "a renowned Japanese artist," and an Occidental version of the original Japanese music will be given.

Justin Huntly McCarthy is putting the finishing touches to a new play entitled "Cæsar Borgia." The character of the soldier-cardinal, with its varied aspects, is of a kind to appeal strongly to the melodramatist. Now that he has about completed his play, Mr. McCarthy, after his custom, is turning it into a novel. Which will appear first, play or novel, is as yet unsettled.

Ellen Terry is to receive a public welcome in her native city, for the mayor and

corporation of Coventry have decided to present her with an address on the occasion of her coming visit, to lay a memorial tablet in a new theatre. The luncheon will be held in St. Mary's Hall. This hall is used for the trial scene in "Adam Bede." The description of it is just as good to-day as when George Eliot attended lectures and concerts in it in the forties: "Grim, dirty armor hung in high relief from the dark oaken gallery at the further end; and under the broad arch of the great mullioned window opposite was spread a curtain of old tapestry, covered with dim, melancholy figures, like a dozing dream of the past." The noble piece of tapestry was executed to commemorate the close connection of Henry VI. and Margaret of Anjou with Coventry. It was mutilated badly during the Parliament wars.

Although "Col. Newcome" is reported as a great popular success at His Majesty's Theatre, in London, it may be noted that the piece is to be withdrawn at the end of the present season, and that on Mr. Tree's forthcoming provincial tour it will be played alternately with "Business is Business" and "The Man Who Was." Nor will it be reproduced in London on the first of September, when His Majesty's will reopen, as that date is set aside for a revival of "The Winter's Tale," with Ellen Terry, Viola Tree, Basil Gill, Charles Warner, and others in the cast. Mr. Tree is to be seen in "Macbeth" in October.

William Archer comes to the defence of Mrs. Alfred Lyttelton's "The Macleans of Bairness," which he describes as a veritable and powerful problem play, although he admits that the effect is badly marred by clumsy workmanship. The piece, it will be remembered, revolves around a situation in which a female victim of the young Pretender—having been forced into marriage with a man who is supposed to be dying, but who recovers—is about to confess her lapse to her husband when the Pretender is again thrown upon her hospitality, and she is compelled to shelter him at the expense of her husband's reasonable but unfounded suspicion. Mr. Archer writes:

On the whole, it must be said that Mrs. Lyttelton has spoilt a finely imagined and, up to a certain point, an ably-developed theme by overlaying its truly dramatic possibilities with incidents of merely external picturesqueness—disguises, surprises, alarms, excursions, and all the conventional frippery of romantic melodrama. As a rule, I am no believer in revised and corrected editions of dramatic works. If your statue does not come out perfect from the first casting, it is seldom any use to tinker at it—better scrap it and start afresh. But there are exceptions to every rule, and I am not sure that it might not be worth Mrs. Lyttelton's while to remodel her last three acts and give so strong a theme another chance of success.

There is not much hope for a play of which three out of four acts need to be remodelled.

"Superb gesture absolute and right always." This single phrase, which occurs more than once in Mr. Macfall's little volume on "Sir Henry Irving" (John W. Luce & Co. \$1 net), may be quoted as a fair example of the spirit and judgment manifested throughout the whole work. That the gesture of this remarkable actor was, in many of his parts, singularly elaborate, subtle, eloquent or appropriate, is a truism; that

it was ever superb or always absolute and right, few even among his most ardent admirers would be bold enough to assert. Of these few Mr. Macfall is one. Nor is he less courageous or dogmatic in his estimate of Sir Henry's other histrionic qualifications. He does admit, indeed, by implication, that his idol had mannerisms which certain fatuous detractors loved to dwell upon; but practically, his sketch, for it is little more, is one outburst of rhapsodic eulogy, untempered by knowledge, insight, or discretion. It might be supposed that his chief object was to furnish picturesque letter-press—in which he is fairly successful, for he writes with vigor and facility—to correspond with the designs of Gordon Craig, which are highly impressionistic, sometimes very effective, but only remotely suggestive of the original. In itself the little book, with its excellent paper, admirable typography, and abundant margins, is attractive and artistic, but as a tribute to Irving it is in almost all respects insufficient. A man such as he, notable for his virtues, his defects, and his achievements, is worthy of a biographer with some sense of proportion. A monument may more easily be built upon a quicksand than fame can be established upon flattery.

The engagement of Camille Saint-Saëns for an American tour next season is announced in the *Musical Courier*. Such a tour would be a notable event, for Saint-Saëns is not only the greatest composer France has ever produced, he is also a first-class pianist, organist, and conductor. His advanced age—seventy-one—would not militate against such a trip, for he is an indefatigable traveller.

By the death of Prof. Heinrich Reimann, Germany loses one of her great organists. He was the first to reveal the full beauty and grandeur of the organ music of Liszt. Luckily, there is another specialist now in the field—Karl Straube of Leizig, who has undertaken to edit all of Liszt's organ works.

Many German cities now have their Richard Wagner streets, but Greater Berlin is going to name a whole quarter after him. In the Friedenau district there is to be a Wagner Place, from which there will radiate eight streets named after the heroines in Wagner's operas: Elsa, Eva, Sieglinde, Senta, Isolde, Ortrud, Guttrune, and Kundry.

Although Mr. Conried sold over \$200,000 worth of "Parsifal" tickets the first year he gave that opera in New York, Bayreuth still flourishes; very much so, indeed. Every seat for the twenty performances of the festival which begins this month was sold several weeks ago. That means receipts of about \$150,000; and, as the expenses are small, few costly singers being engaged, Cosima and Siegfried Wagner will again pocket about \$100,000 clear profits.

Of the \$6,000 necessary for the purchase of Bach's house at Eisenach, about \$2,000 remains to be collected.

The report that the San Carlo Opera Company is to visit America the coming season is emphatically denied by the secretary of the San Carlo Theatre. He would have to be a very foolish or a very courageous manager who would undertake to try a third grand opera company next winter in New York—for New York is the only

American city (now that San Francisco is out of the question) that cares enough for opera to make it profitable.

Ernest Newman of London contributes an interesting article on Brahms to the July number of the *New Music Review*, in which he tries to explain why that composer is so antipathetic to many people. He finds the reason largely in "the prevailing ashen grayness of his music," and his inability to exult at any time. On the other hand, while some of his music is pity-moving, "there is no pathos in it, in the real sense of the word." His writing is that of a profoundly depressed, disappointed man. This was the quality in it that alienated Nietzsche. Brahms's melancholy, he said, was the "melancholy of impotence." "A thousand hearers," adds Mr. Newman, "have had much the same impression." Again: "There is something elderly in this music. . . . It does not feel the joy of life." Mr. Newman then proceeds to trace these traits, this weariness and fretfulness, to his heredity and his upbringing. His mother was forty-four, and a sickly woman, when he was born. Her first child suffered all her life from bad headaches. Brahms's brother Fritz died at an early age of a disease of the brain, and he himself as a boy was subject to nervous headaches. Nor as a child did he have the advantages of good air, abundant food, and happiness to counteract these drawbacks. To sum up: he began life "with something lacking in the innermost springs of his soul—the poor, little, peevish, ailing, badly nourished mother, who bore him in the decline of her days, the scanty food, the sunless rooms, the childhood that was dark and joyless within and without. Add to this the disease of the liver of which both Brahms and his father died, and we get data enough to account for the jarred and jangled nervous system that put him out of tune with life."

Some of Richard Strauss's remarks at a rehearsal of his sensational opera "Salome" at Prague have been put on record by a member of the orchestra and printed in the *Leipziger Nachrichten*. At one place he stopped the orchestra and said to the players: "Gentlemen, that must sound very sweet—must smack, as it were. Imagine yourselves eating a luscious pear which actually melts on the tongue." Such moments, however, were rare. On the whole, he showed that he regarded the orchestra as the prime factor. "No consideration for the singers! In this opera there is no consideration," he exclaimed at one place. The passage was repeated more vigorously. Then came a place where the trombone and trumpets added to the din. Again Strauss interrupted them. "Children," he said, "that is too gentle. We want wild beasts here. This is no civilized music; it is music which must crash. Go to the zoo and listen to the wild beasts there. That's the way it must sound."

NOTES ON RELIGIOUS BOOKS.

Prof. Henry Melvill Gwatkin of Cambridge University, author of several essays on the Arian Controversy, sends out a volume of some twenty-eight sermons under the title "The Eye for Spiritual Things." (Imported by Charles Scribner's Sons, \$1.50 net.) It is a pleasure to take up an honest book of sermons, one which does not pre-

tend to be anything other than a collection of occasional discourses on spiritual themes. English sermons of the best type—and Dr. Gwatkin's are of this sort—afford a peculiar delight and satisfaction. They are chaste and dignified, orderly and quiet, without screaming for oratorical effect, conveying a happy sensation of established faith and power held in reserve. An English preacher is not afraid to introduce a discussion of the meaning of a Greek word, nor to assume some small knowledge of important matters in Church history. The present volume ranges over a wide class of subjects, though no theme is handled which is not of importance in the religious life. The point of view is indicated in the following sentence: "The knowledge of God is not to be earned by sacrificing reason to feeling, or feeling to reason, by ascetic observance or by orthodox belief; it is given freely to all that purify themselves with all the force of heart, and soul, and mind."

Now that the Episcopal Church is casting out Dr. Crapsey, perhaps the Baptists may lay claim to being the "roomiest church in America," an honor Phillips Brooks asserted for the Episcopalians. Professors Schmidt and Foster, who are both Baptists, maintain the doctrines for which Dr. Crapsey was condemned, and the best-known Baptist teacher of systematic theology, Dr. William Newton Clarke, has said that the dogmatics of the future would need no doctrine of inspiration. That the newer views have not penetrated to the denominational headquarters is shown by Dr. Eaches's "Commentary on Hebrews, James, I. and II. Peter" (Philadelphia: American Baptist Publication Society). This official commentary is altogether in the bonds of traditional orthodoxy. It is announced as a "popular commentary upon a critical basis," but the criticism on which it is based is certainly of a very dogmatic and unenlightened sort. If one thing in New Testament criticism is established it is that II. Peter is not authentic, but Dr. Eaches conveys the impression that recent scholarship favors the Petrine authorship. The weighty arguments against the authenticity of I. Peter and James are scarcely mentioned. The difficulty over the eloquence of Balaam's ass is met by the explanation that the whole affair was a vision. Works of this sort tend to bring denominational publication houses into disrepute.

Professor Charles Foster Kent, Woolsey Professor of Biblical Literature at Yale, is well known as author and editor of several volumes and series of volumes which aim to popularize the results of Old Testament criticism. His latest undertaking of this sort, "The Origin and Permanent Value of the Old Testament" (Charles Scribner's Sons, \$1.00 net), is designed for clergymen and Sunday-school teachers who have little technical knowledge of Biblical criticism, but who may wish to learn without too much trouble what the critics are teaching about the Biblical documents. This end is well attained. The style is clear, confusion of detail and argument is avoided, and salient features are kept well to the fore. The positions advanced are those generally accepted, disputed points being avoided. The author is optimistic of a revival of interest in the Old Testament through the spread of knowledge of

the results of criticism. He suggests methods to be employed in using the Old Testament in Sunday-schools and day-schools, and sketches a rough outline of a course of study extending over several years. A detailed plan, suitable for actual school use, carrying out the suggestions of this outline, would be heartily welcomed.

The hold of conservative views in regard to the New Testament upon many English students of undoubted scholarship is illustrated by Dr. Dawson Walker's "The Gift of Tongues and Other Essays" (imported by Charles Scribner's Sons, \$1.75 net). The purpose here is confessedly apologetic, and that in the narrow sense of defending the historical validity of the Acts and the early date of both the Acts and the Gospel of Luke. Competent critics hold that the account of the speaking with tongues in the second chapter of the Acts is a misinterpretation of that phenomenon common in early Christianity which Paul describes so graphically in the first Corinthian letter, and the inference would seem to be justified that the narrative of Pentecost was written at a later date, when the matter was no longer understood. The argument of Dr. Walker that the *glossolalia* at Pentecost was actually a speaking in foreign languages, induced by the medley of tongues heard in Jerusalem on the occasion of the great feast, is ingenious, but will hardly carry conviction. Even Professor Ramsay, the doughty champion of the Acts, admits that in Acts ii. "another popular tale seems to obtrude itself," and that the narrative is due to the "disorting influence of popular fancy." In another essay, Dr. Walker struggles manfully, but hardly successfully, to reconcile the accounts in Acts of Paul's visits to Jerusalem with the Apostle's own testimony in Galatians. The larger and more important question as to what the gift of tongues really was, both in primitive Christianity and in other ages in which it has occurred, and how the phenomenon should be interpreted psychologically, Dr. Walker does not consider. His interest is exclusively in establishing the harmony and trustworthiness of the writings attributed to Luke and Paul. It must be said that his effort is of little account against the difficulties brought out in the writings of Weizsäcker, McGiffert, and Bacon.

The Rev. Dr. David W. Forrest, an Edinburgh theologian of conservative tendency but tolerant spirit, is the author of a discussion of "The Authority of Christ" (imported by Charles Scribner's Sons, \$2 net). The work occupies the same mediating position as this writer's "Christ of History and of Experience," issued a few years ago. The thesis is that Jesus is not to be regarded as authority in matters of literary criticism, to determine the authorship of a Psalm or to decide whether the stories about Abraham are legendary or historical, but that his authority consists purely in his "final revelation of religious truth and practice, of what man is to believe concerning God, and what duties God requires of man." Dr. Forrest has much to say to his orthodox confrères about the "illegitimate extension of Christ's authority," but just where he would draw the line between "illegitimate extension" and proper continency in this matter he does not make clear, nor does he establish plain-

ly his right to draw any line at all. The discussion leaves much to be desired in point of clarity and logic. The term authority itself is not defined. The presuppositions, both dogmatic and historical, are somewhat large for those not used to the ways of Scotch theology. Yet doubtless some who cannot go the length of Sabatier in his rejection of all "Religions of Authority" may here find standing-ground whereon they can admit the more pressing contentions of critical students, while holding to the principle of authority as tenaciously as before.

Students of the New Testament who noted the exhaustive work of James Hardy Ropes on the Agrapha, or sayings of Jesus outside the canonical Gospels, issued in German some years ago, will be prepared to give a cordial welcome to his more popular lectures on "The Apostolic Age in the Light of Modern Criticism" (New York: Charles Scribner's Sons. \$1.50 net). Examination of the work reveals not only a thorough and painstaking scholar, but also a writer of no little skill in holding material well in hand, in suppressing overplus of detail and bringing salient points into the clear, and also in presenting critical results with a minimum of offence to traditionalists. In the present state of popular information it is difficult to write on the history of the period without attracting more attention to critical questions than to the history one desires to narrate. Professor Ropes has met this difficulty admirably, and the stirrings of great days occupy one's mind as one reads these lectures. The portrayal of the personality of Paul is especially vivid. The poetical element in the character of the great missionary has scarcely found better description than in this essay. Professor Ropes is more conservative in critical opinion than one might expect. Of the Acts he writes, "It approves itself not as infallible nor as equally trustworthy in all its parts, but yet as so good history that a discriminating use of it yields a solid body of critically sifted knowledge." He holds that Luke was the author, and also that I. Peter is authentic. There are occasional blunders in proofreading; the subject has been omitted from the third sentence in Chapter I., and the verb from a sentence on page 75. A strange slip occurs on page 194f., "Paul not only found in the word of Proverbs about muzzling the ox a warrant for the support of the Christian missionary by those for whom he labored," etc. The work about muzzling the ox is not from Proverbs, but is found in Deuteronomy xxv. 4.

JOHNSON WITHOUT BOSWELL.

Lives of the English Poets. By Samuel Johnson, LL.D., edited by George Birkbeck Hill, D.C.L. With brief memoir of Dr. Birkbeck Hill by his nephew, Harold Spencer Scott, M.A. Three vols. New York: Oxford University Press. \$10.50.

The Dr. Johnson whom all of us know is Boswell's Johnson and nothing else. Not one man in a thousand who has read Boswell's book retains any other impression of the great lexicographer than that to which Macaulay has given full expression. "In the foreground," he writes, "is that strange figure which is as familiar to us as the

figures of those among whom we have been brought up, the gigantic body, the huge massy face, seamed with the scars of disease; the brown coat, the black worsted stockings, the gray wig with the scorched foretop, the dirty hands, the nails bitten and pared to the quick. We see the eyes and mouth moving with convulsive twitches; we see the heavy form rolling; we hear it puffing; and then comes the 'Why, sir!' and the 'What then, sir?' and the 'No, sir!' and the 'You don't see your way through the question, sir!' . . . The reputation of those writings, which he probably expected to be immortal, is every day fading; while those peculiarities of manner and that careless table-talk, the memory of which he probably thought would die with him, are likely to be remembered as long as the English language is spoken in any quarter of the globe." Johnson's fame as an author is indubitably obscured by the portrait drawn of him as a person by the genius of Boswell. If his books are, or ought to be, on the shelves of every gentleman's library, they are allowed to remain undisturbed. Only two still live—the "Vanity of Human Wishes" and the "Lives of the English Poets." They alone have earned that sort of immortality which is given by the vote of that much despised general public whose verdict is the final judge of merit.

It was a happy idea of Dr. Birkbeck Hill to publish the "Lives" in what will probably be their final edition; and by singular good fortune the labors of editorship, in so far as they were left uncompleted at Hill's death, have fallen into the hands of a nephew who has fully carried out his uncle's conception of thorough work. With these volumes in hand it is worth while to try to form some estimate of Johnson as an author, and to consider how we should now have looked upon his work if he had never met Boswell.

The fanaticism of hero-worshippers naturally excites even calm critics to under-rate Johnson's claim to high place among England's men of letters. We grant that in the "Lives of the Poets" Johnson's genius was subject to marked limitations. Neither as a biographer nor as an author did he strike out a single new idea. He had not a spark of the originality of Burke, Hume, or Adam Smith. Characteristically again, in common with the ordinary educated Englishmen of his day, he took no interest, except by way of opposition, in the intellectual movement of the age. He died in full possession of his faculties in 1784, six years after the death of Voltaire, and five years before the meeting of the French States General, but there is little or nothing, either in the "Lives" or in Johnson's conversations as recorded by Boswell, which shows keen appreciation of the ideas which day by day were gaining greater influence, or any prescience of the coming revolution, which was destined to transform not only the political institutions, but also the thought of Europe. Moreover, Johnson's criticism lacked two qualities which, for the last seventy years, have been held of supreme importance. The first is capacity for sympathetic appreciation; the other is a conception of the historic method. Whether these qualities are really essential to sound criticism, may be questioned. Whatever their worth, they were certainly

not possessed by the author of the "Lives of the Poets."

Let every concession be made, however, which can fairly be demanded by the sternest censor; let it be admitted that Johnson, as a critic, occasionally made grotesque blunders, and that it is hard to understand how a writer capable of expressing fervent admiration for Milton's poetry, could yet write of "Lycidas" the following condemnation:

In this poem there is no nature, for there is no truth; there is no art, for there is nothing new; its form is that of a pastoral, easy, vulgar, and therefore disgusting; whatever images it can supply are long ago exhausted; and its inherent improbability always forces dissatisfaction on the mind.

Johnson also declares of "Samson Agonistes" that "it is only by a blind confidence in the reputation of Milton that a drama can be praised in which the intermediate parts have neither cause nor consequence, neither hasten nor retard the catastrophe." Let it further be noted that every page of this last edition of the "Lives" betrays through the very care of its editors the carelessness of Johnson. Let all this be admitted, and there still remains the one question worth answering: What, judging from the "Lives of the Poets," are the qualities which place Johnson in high rank among English men of letters?

Of these qualities the most obvious and important is that every page is pervaded by Johnson's personality. His good sense, his strength, his very prejudices, and a certain rough carelessness as to petty details, all give vividness to the biographies of men, many of whom, but for Johnson, might at the beginning of the twentieth century be entirely forgotten. Throughout the "Lives" the reader feels in contact not so much with a book as with a living man. This power of throwing an author's own character into his writing has nothing to do with egotism or self-consciousness. It is one of the rarest of gifts. All of us have known writers of wit and wisdom who in private life were the delight of friends and who as authors were the teachers of their generation; yet by some curious fatality they could not, or would not, put themselves into their books. In print they kept indeed their wisdom and their subtlety, but they did not reveal the pungency or the pleasantry which gave to their talk its exquisite flavor. Compare Johnson's "Lives" with the series of lives of English Men of Letters edited by John Morley. The comparison is a fair one. Each of the biographers selected by Morley is an author of eminence; each is well acquainted with his subject; some of them, as for instance Leslie Stephen, John Morley himself, Mark Pattison, or Cottoer Morrison, may be counted among the most distinguished critics of their time; yet though several of the biographers whose names we have mentioned have left upon their work traces of their own individuality, the series is as a whole colorless. Each life is superior in research to any written by Johnson, but "English Men of Letters," excellent though it be, will never stand side by side with the "Lives of the Poets." The contributors to the modern series have written valuable books, which may be read with instruction; but Johnson has enabled us to enjoy not so much a book as the con-

versation of a man of genius who, himself a devotee to literature, talks to us about the works and doings of authors with whom he has formed intimate acquaintance. The work that comes nearest to and may well last as long as Johnson's "Lives" is Leslie Stephen's "Hours in a Library." Here again we can hold interesting communion with a man of letters. But then the "Hours in a Library" is, like Johnson's work, the product of one man's labor. At a time when it is vainly imagined that even in literature the combination of many men can equal the good work of one, it is well to be reminded that in the world of letters a body of a hundred men can never in reality achieve the triumphs which are the monopoly of individual genius.

Another peculiarity of Johnson's book is the attraction of its style. Each of the fifty-two lives is good reading; you have in them Johnson's vigor and humor with relatively little of the stilted pomposity which deforms his more serious writings. The readable quality of the book is traceable as much in the slightest as in the longer lives. The verses of Shenstone, known to most Englishmen only through Johnson, just entitle him, we suppose, to the name of poet; but the pettiness of the man who devoted his life to satisfying the "ambition of rural elegance" and ruined himself in keeping up gardens of which the artificial prettiness excited more amusement than admiration, is hit off with an ease and brevity rarely found in writings professedly humorous. "The pleasure of Shenstone," we are told, "was all in his eye; he valued what he valued merely for its looks; nothing raised his indignation more than to ask if there were any fishes in his water. His house was mean, and he did not improve it; his care was of his grounds. When he came home from his walks he might find his floors flooded by a shower through the broken roof; but could spare no money for its reparation. In time, his expenses brought clamors about him that overpowered the lamb's bleat and the linnet's song; and his groves were haunted by beings very different from fauns and fairies. He spent his estate in adorning it, and his death was probably hastened by his anxieties. He was a lamp that spent its oil in blazing."

Here we touch upon a third quality which has kept alive not only Boswell's Johnson, but Johnson's own "Lives." To Englishmen Johnson was and will remain till English society is fundamentally changed, the ideal of a "moral philosopher." This term in England has in truth a somewhat peculiar sense. The moral philosophers whom Englishmen agree to admire have not been men of subtle intellect; they have not been thinkers who have struck out new and profound ethical distinctions, or have succeeded, if indeed such success be ever possible, in forming a coherent and demonstrably true theory of morals. They have always been men who, though differing in many ways, have accepted the moral doctrines which to ninety-nine Englishmen out of a hundred appear to be axioms so firmly established that it is not worth while to spend time in trying to discover theoretical vindication of their authority. The moral teachers in whom Englishmen delight, while ac-

cepting the established morality of their time and country, have shown their genius, not in tracing it to its source, but in applying it with skill to the constantly recurring problems of everyday existence. Among such men he is the greatest who can best apply morality to the conduct of life. The Socrates of Plato, much as we are all supposed to admire him, might not have been persecuted, but assuredly would have failed to obtain any great influence in the England of the eighteenth, or for that matter of the twentieth century. The Socrates of Xenophon might have done better, but he would never have gained the position of Johnson. From an English point of view the great lexicographer and the author of the "Lives" was the incomparable moralist; he brought force of character, skill in logical argument, and that sort of blunt discrimination which characterizes a critic whose vigor is greater than his subtlety, to the solution of all the problems, great and small, of actual life.

He had, moreover, the advantage which always attends a teacher who, while seeming to oppose, really falls in with the feeling of his time. There is scarcely one of Johnson's biographies which does not contain some discussion of a moral problem. Take, for example, the question raised in the Life of Pope, whether, as commonly believed, "the true characters of men may be found in their letters, and he who writes to his friend lays his heart open before him." To the inquiry Johnson replies with a decided negative; for his reasons our readers must be referred to the Life of Pope. What we insist upon is, that here, and throughout Johnson's writings, the problems of life are treated in the manner which will always interest English readers. In this particular case he treats, as often, a comparatively small question. He can rise to a much higher level; but his morality, when highest, is still concerned with conduct:

Pour forth thy fervours for a healthful mind,
Obedient passions, and a will resign'd;
For love, which scarce collective man can fill;
For patience, sov'reign o'er transmuted ill;
For faith, that, panting for a happier seat,
Counts death kind Nature's signal of retreat:
These goods for man the laws of Heav'n ordain,
These goods he grants, who grants the pow'r to gain;

With these celestial Wisdom calms the mind,
And makes the happiness she does not find.

TWO NOVELS.

Coniston. By Winston Churchill. New York: The Macmillan Co.

The District Attorney. By William Sage. Boston: Little, Brown & Co.

Mr. Churchill has a passion for beginning at the beginning. Fortunately, his taste and feeling lead him to write about America, not about countries of longer lineage, Egypt, for instance. What a thankless toil to work up from the Pharaohs and Moses to a story of the doings of Cook's tourists on the Nile! In a country that broke so abruptly and thoroughly with its past as did the United States, it is easy for an historian to get at the first symptoms of conditions now very general and important. Mr. Churchill, who always assumes the seriousness of an historian, and spells "era," his "era," with a capital letter, in his latest novel puts his finger on

the very moment when the "boss" appeared in American politics—on the Moment and the Man. "Coniston," a New England village, is the name of the place where one Jethro Bass, a tanner (who, winter and summer, wore a coon cap and tucked his trousers in his boots), invented a new vice, the vice of being a political boss. Mr. Churchill's great achievement is finding the first boss, the man who first thought of buying other men on a large scale to betray public trusts and laugh at their own dishonor. The mystery of the boss's core (he has not, properly speaking, heart or soul) has been made clearer to common apprehension in at least two novels, one of which describes a New York potentate and the other a Western one. Jethro Bass is laconic and inscrutable. Perhaps by saying nothing and rolling a dangerous eye in critical moments, a man may rise to great eminence in his country's affairs, but it is difficult to believe that the process is so simple, and such bare statement does not satisfy the curious, who, seeing wonderful results, demand some approximately remarkable cause.

As a mere man Jethro Bass is better explained than as a boss. Against his assumed passion for power is set his realized passion for a woman, Cynthia Ware, a woman loved and lost in youth and never forgotten. When the tides of time beat her daughter, Cynthia Wetherell, to Bass's door, his passion for the mother merges into love for her child, and an interesting and dramatic situation develops from their close relationship. After the introduction of Cynthia as a factor in the boss's campaigns, the tale moves. Influenced by Cynthia's horror of his profession, Bass retires from public life, returning only to take revenge for an insult offered to her. At the end of a great fight with victory in his hands, he accepts humiliating defeat in order to ensure her happiness, and thus becomes a fitting hero of romance.

Cynthia is the lovely New England girl with a conscience, so common in American fiction. There is, of course, even at this late day, a great deal of conscience distributed among the women of New England, but as a matter of fact it is not so often associated with physical beauty as novelists would have us believe. Still the proper note of idealism is here struck—supreme beauty united with perfect goodness. Cynthia's lover is worthy of his luck, and the complications which threaten their happiness, but fall short of frustrating it, are well imagined and combined. "Coniston" would have been a good novel if it had begun in the middle.

A novel is a social as well as an æsthetic symptom. Viewed as such, and as largely typical of its class, Mr. Sage's new book can hardly fail to have a depressing effect on the intelligent reader. It is cleverly planned and written—so are many of the novels that appear in shoals—it is timely in more senses than one: for it is the story of a Trust magnate's son who scorns and rejects both his father's wealth and the method of collecting it, and who, as the chance-elected district attorney, applies the brain and will power inherited from his parent to an ultra-modern anti-"graft" campaign against his father's closest business associates. Thus the plot is full of legitimate chances for effects of

a highly dramatic quality. And barring a touch of "preciousness," a proneness to euphuistic smartness not quite foreign to more sincere artists, the style of Mr. Sage would lend itself well enough to huddling up a story that might touch the reader as a page out of life. But instead of this, it has been employed to provide verisimilitude for a conventionally sensational tale about conventionally unreal people. The author has nothing to tell his reader. Not even artistic appreciation of the quaint aspect of some unexplored nook of the world, or of man's heart, has tempted him into literary venture. Every line of his book makes it evident that he has set out, with cold-blooded recognition of all the factors involved, to produce a certain commodity thought to be wanted by the public. Such a judgment may be deemed unnecessarily harsh and arbitrary. Its excuse is that it constitutes an arraignment not of a single book, but of the spirit in which novels are written and published in this country to-day. Mr. Sage, to judge at least from results, has simply seized the opportunity offered by the public's present interest in "graft" and the fight against it. And yet his principal fault does not lie here so much as in his offering us puppets instead of real men and women for the illustration of an important and impressive social phenomenon.

The Silver Age of the Greek World. By John Pentland Mahaffy. Chicago: The University of Chicago Press; London: T. Fisher Unwin. \$3 net.

When, in 1890, Professor Mahaffy published "The Greek World under Roman Sway," it would have been hard to point to another book in which the English reader might find a popular survey of the Græco-Roman period, its life and literature. Of Rome and how the Greeks affected Rome he could read in the pages of Gibbon or elsewhere. How the Romans, for instance, governed Bithynia, he might have been taught to observe in the Letters of the younger Pliny. But how the Bithynians felt towards Rome was a secret that lay buried in the unread pages of Dion of Prusa, whose name is never heard by the ordinary student unless he choose to write a doctor's dissertation in the post-classical literature. Mr. Mahaffy's book remains the only work of its kind. Most people are indeed perfectly willing to ignore the very considerable remains of Greek letters that have reached us from the first few Christian centuries. They read Plutarch (but only the "Lives") and Marcus Aurelius in good translations, and are right in thinking that here are two authors who are just as improving in English as in Greek. They even have a vague notion that Lucian was the Greek Voltaire, and they can now go further and read him complete in Mr. Fowler's excellent four-volume translation. But the theatrical declamations of the Sophists, even if we had many of them to read, leave one cold enough. They are all the productions of hungry Greeklings who had nothing to say. So it is that the phrase "the New Sophistic" carries a definite meaning only to a few specialists who, however, take a private and singular pleasure, which is almost æsthetic or sporting, in their knowledge of the correct points of a

"birthday speech" or a paradoxical panegyric of baldness, or a gnat, or a parrot; the commonplaces, the rhythms, the gestures, the exquisite toilette that were *de rigueur* in that all-absorbing game of declamation. Under the phil-Hellenic emperors of the second and fourth centuries it was, indeed, like nothing so much as a sport, and one trained for an appearance as for an athletic event. It was the day of professors. Never since then have they been the cynosure of all eyes, their movements chronicled like the comings and goings of a favorite actor. They toured like theatrical stars, and the regular drama was nowhere. The Greeks no longer wrote poetry; but the glittering Sophist taught the youth and held the public stage at once.

This is one side of Greek life under the heel of Rome that Mr. Mahaffy made clearer to his readers, yet even he did not attempt to make a comprehensive survey of the literary activity of these times. He was more interested in the men who broke away from the glamour of the professional life and called themselves philosophers, which in those days meant lay preachers. Such was Dion of Prusa, and Mr. Mahaffy exhumed and translated from the dead mass of his eighty extant speeches and essays certain passages which reveal unsuspected charms in this revivalist, who went from town to town rebuking the citizens (in elaborate harangues crammed with literary allusions) for their besetting sins, which were chiefly bad taste and a lack of seriousness. These were the days before Arnim's well-printed edition, and there must be many who would never have turned to the Greek of Dion (unless driven there by "graduate" work) save for Mr. Mahaffy's lively chapters. There are, however, few things more charming, even in Theocritus, than the idyl of life in Eubœa, called "The Hunter," which he in great part translated. Even more illuminating for the understanding of what life was in the corners of Trajan's empire is the narrative of that little northern town on the coast of the Black Sea where Dion found Greeks devoted to Homer, ready, in fact, to avenge as a personal insult any criticism of their idol, for this happy town knew nothing of literary criticism, and admired the best by instinct. They spoke rather bad Greek, as men surrounded by barbarians, holding their small outpost against the Scythians. But they fell at the feet of this educated stranger, and were by no means bored when Dion, true to his colors, discoursed to them like any Sophist on the charms of monarchy as an institution.

"The Greek World under Roman Sway" is out of print, and the new volume, in spite of its changed title, is intended to take its place. On the whole it would have been less confusing to retain the old title when one retained so much of the old book. The implication of the new name is literary, whereas the chief interest is still history and social life. The work before us is, in fact, simply a revised edition. The number of pages is hardly increased. Here and there a sentence is recast, a word inserted or omitted, or a modern parallel such as used to flow so freely from the wide-ranging author has been suppressed; some footnotes are ad-

ded. It is not till we reach Chapter III, "Hellenism in Upper Egypt," that we find a whole new though very brief chapter on the settlements of the Greeks in Upper Egypt, on which so much light has been thrown in the last fifteen years by the finds of papyrus at Oxyrhynchus or in the Fayyum. Mr. Mahaffy has here incorporated the results drawn from the Petrie papyrus published by himself in the Cunningham Memoirs in the early nineties, and from the memorable collections of Grenfell and Hunt. He gives a brief résumé of what was actually found at Gurob and the story of the settlements of Macedonians and Greeks in Egypt under the Ptolemies, which will be welcome to many who have not access to the official publications of the Ptolemaic papyrus. This is the main addition to the book. He still has nothing to say of Græco-Roman literature later than the time of Dion, skips Lucian altogether, and gives us perhaps a little too much of the amiable Plutarch. His book is, however, the only one of its kind in English, and will always be read, under the old name or the new, with entertainment. We wish he would not, following perhaps the bad example of some Germans, write, as he does throughout, *Oxyrhynchus* for the more correct *Oxyrhynchus*. The index has been enlarged and much improved.

The Rise of American Nationality, 1811-1819. By Kendrick C. Babcock. [The American Nation, vol. xiii.] New York: Harper & Bros. \$2 net.

So much of Dr. Babcock's volume as relates to the War of 1812 has received elaborate and, in some respects at least, definitive treatment at the hands of Henry Adams and Capt. Mahan. Professor Hart, in his editorial introduction, suggests that to follow in the footsteps of these well-known writers is "a daring task." There can be little occasion, however, for criticising adversely a writer who is called upon, by the scheme of his work, to present with studied brevity what others have presented *in extenso*; provided always, of course, that the authorities have been well used, the salient facts properly brought out, and the events narrated in orderly and effective fashion. Dr. Babcock meets this test well, and the reviewer need do little more than commend what he has written. There is, to be sure, a pervading frankness and downrightness of personal judgment, especially in regard to the conduct of political and military leaders during the War of 1812; but the judgments are sound, and praise and blame are placed where they belong.

For the rest, the narrative, though necessarily brief, presents matter of much interest. The political conditions in the United States, for example, during the three years immediately preceding the declaration of war, are clearly brought out, especially those of the "reign of faction" from 1809 to 1811. The same may be said of the discussion of affairs in the Southwest and Northwest during the same period. The foreign relations of the United States, too, are especially well handled, as they have been in general in the preceding volumes of this series. The attitude of New England during the war has long been a stumbling-block to historians, inspiring apology or

denunciation oftener than judicial examination. Dr. Babcock does not, we think, go deeply enough into the causes of the New England disaffection to make those causes wholly clear—there is, for instance, a subtle social temperament whose significance he seems hardly to have grasped; but he certainly succeeds in showing how grave the danger of secession really was, and how serious the weakness of the Federal Government which it revealed. The episode must always remain a striking illustration of the truth that New England, like other sections of the country, has not invariably exhibited a high order of political morality in times of political and social stress.

With the close of the war, Dr. Babcock's narrative enters upon less familiar ground, and ground, too, which cannot readily be marked off into definite chronological divisions. Political questions become larger as well as of different character; economic issues more and more modify party creeds and party action; sectionalism and slavery show themselves in new and unexpected shapes, and foreign complications for a time recede. The war ushered in nationality, though there remained to be seen what form the new national spirit would take. Certain important questions, accordingly, receive here only preliminary treatment. Such are the financial reorganization after the war, the establishment of the second Bank of the United States, the development of protection, and the emergence of the Supreme Court as the representative of a coördinate department of Government. The demand for internal improvements at Federal expense, following the pronounced westward migration, was shortly to become an element in the great democratic revolution. Into this period falls also the second expansion of Federal territory with the acquisition of the Floridas—a dubious transaction, whose devious course is followed with especial clearness and grasp.

This summary account of the chief matters touched upon in Dr. Babcock's book should not fail to make mention also of the admirable literary form in which the narrative is cast. The writing is always good, not seldom strikingly so; indeed, no volume of this series thus far exhibits more commendable literary qualities. The bibliography, as usual, lists the principal authorities, though Sumner's "Jackson" and the important "Calhoun Correspondence" seem to be omitted. The reference to the Supreme Court reports is vague, the authoritative edition being nowhere clearly referred to.

French Pottery and Porcelain. By Henri Frantz. London: George Newnes; New York: Scribners. \$2.50 net.

We have already printed in these columns notices of three of the valuable books belonging to the Newnes Library of Applied Arts. The latest is of less originality of conception than, for instance, that on Dutch pottery or English table glass, but this merely because there are valuable works already devoted to French ceramic ware, and because the subject is really too vast to be treated in one small volume of large print. The chief objection to the book taken by itself, without comparison with others of the series, is that no at-

tempt is made to carry out the promise of the title. "French Pottery and Porcelain" without a word of any ware produced in the nineteenth century! Not a syllable on the work of potters like Massier, with his really wonderful glazes and the brilliant designs of his earlier time; not one of the stone-ware with colored enamels made at Sèvres during quite recent years! The title should be modified in some way, and also it should be made clear in some preface or editorial note what the pretensions of the work really are.

There are some indications which point to the cutting down of a fuller original in another language to the present English text. There are signs that the work has been written by some one not familiar with English, or else translated by some one not wholly competent, or not very careful. There are curious errors, like the non-sequitur on pages two and three, in which it is asserted that there was once a factory at Rouen of whose products only two enamelled tiles are known, and André Pottier has proved that there was a potter there named Abaquesne, it was Abaquesne, *therefore*, who executed not only these tile pictures, but also other existing works. On page 39, dishes 20 inches in diameter are accounted for by the necessity of passing them from one guest to another, so that "each held meat for 18 to 20 persons"; and this, again, is explained by allusion to "an ordinance of Louis XIII., forbidding the possession of more than one complete service and one row of dishes." Now it is not impossible to arrive at the author's meaning in general, but what is meant by "one row of dishes" or by other expressions in this paragraph; and why is the author astonished at dishes large enough to contain a good deal of "meat" to be passed from guest to guest, as so frequently in modern service? He seems to refer to the big round platters which are certainly characteristic of Nevers pottery, Moustiers pottery and the like, even though the very largest seem to be of Rouen; but Chinese porcelain dishes and those of the Imari ware of Japan are easy to procure larger than the largest dish of French faïence, except a few magnificent pieces of Rouen ware, charged with armorial bearings and intended for display and for decoration. Indeed, it is probably not the size which troubles Herr Frantz, but rather the circular form. There are oval dishes, too, of these wares, and long fish platters, big enough, one is inclined to say, to hold the largest fish that ever was served on a table. In Solon's excellent book, reviewed in these columns a few months ago, there is given a rectangular Rouen dish 28 inches long; but it is painted with an armorial achievement, and was meant to frame into the wainscoting over a chimney-piece. But the circular platters painted in green or in orange-yellow or in dull blue or sometimes (though less often) in polychromy are the characteristic feature, no doubt. The plates, also, were very large at the same time. Those things are matters of fashion. There are many people who like them as large, today.

It is hard to find any important statement or set of statements in this book which does not exist elsewhere, and in accessible books, too. There are some state-

ments which one would like to have remarked upon by a careful student. Thus (p. 105), the statement is made that the sales of the Sèvres manufactory do not now exceed 100,000 francs a year, and it is implied that in former years they were much larger. Curious reasons are offered for this. Perhaps "the public does not care to see the State acting as merchant," or perhaps "the porcelains of Sèvres are less perfect than formerly." But, indeed, it has never been considered an important part of the work of the Sèvres factory to make objects for sale. The chief purpose has been to produce furnishings for royal residences and presents—honorary gifts to people of importance. It is even with reluctance and in the slowest and most awkward way that important sales are made. You may, indeed, get small pieces—vases and ink-stands and little *raviers*—for a most exorbitant price, cash down, twenty-five to sixty francs for very unimportant pieces. But if you want anything worth having, a set of plates specially painted, even a reproduction of a piece already made, you have to make the purchase with the clear understanding that no guaranty as to time of delivery is made to you, that some time or other you will be notified that the piece is ready, and that you must take it then, "without recourse." Perhaps, under the circumstances, 100,000 francs a year is a fairly large sale, considering that almost everything really worth having is taken out of the list of things thus sold.

There is a two-page list of useful books of reference, and ten pages or more of marks of this and that factory, epoch, or maker, but not at all complete; even the Sèvres show of marks leaves many unmentioned, and there is no adequate explanation of those marks which need it the most, such as the stamp defaced by a file-cut, which is said here to indicate "rejected pieces"—a quite insufficient explanation. There is, also (pp. 132-152), a select list of sales, with the prices given for important pieces. It is interesting to learn of that candlestick of what we used to call Henri Deux ware, which was sold for 91,875 francs in the Fountain collection, dispersed by auction in London in 1884, but there is no adequate opportunity for comparison of price with price or piece with piece.

On the whole, the most important part of the book is its illustrations. These have been made and the examples selected with considerable good taste and thoroughness. There are fifty-eight such plates in half-tone and seven in color, and some of the plates represent several pieces each. It is awkward, however, to find in a plate announced, both in the list of illustrations and in the "caption" under the plate, as devoted to one ware, such as Moustiers faience, a piece which is not of that factory, and this misleading error is of frequent occurrence.

Plant Response as a Means of Physiological Investigation. By Jagadis Chunder Bose, M.A., D.Sc. Professor, Presidency College, Calcutta. New York: Longmans, Green & Co. \$7.

Except to those who are acquainted with the previous work of this author, the present treatise may come as a surprise. It is a substantial octavo volume of more than 700 pages, devoted to the elucidation and

illustration of a single thesis. Although this thesis is here given in many forms and stated in connection with numerous associated topics, it is essentially simple in its outline. It is this: the plant is a machine; its movements in response to external stimuli, though apparently various, are ultimately reducible to a fundamental unity of reaction. But the movements here referred to are not alone the obvious movements which the eye readily sees, as in the case of the sensitive plant and in that of the twiners. Everybody knows to-day that all young parts of plants possess a limited power of movement in response to certain external stimuli, but to this interesting chapter in the life-history of plants Professor Bose adds others which are of even greater interest. In general, it may be said that, by means of ingenious delicate instruments which exaggerate the slightest motions at any spot, he has been able to demonstrate that even the oldest tissues of a plant, so long as they are living, are capable of responding in a marked degree to certain external stimuli. By the employment of a beam of light reflected from a mirror attached to a multiplying lever, and falling on a recording drum covered with photographic paper or film, he records the amplitude of the very minutest movements of these responses. Now it so happens that many of these responses are exceedingly complex and exhibit confused effects, due to internal energy and external stimulus respectively. Professor Bose believes that he has been able to disentangle these complex phenomena of combined action. After this disentangling and exact discrimination have been effected, he arrives at the conclusion that "there is no physiological response given by the most highly organized animal tissue that is not also to be met with in the plant."

A special feature distinguishing this treatise from many of its class is the presentation, at the end of every chapter, of a summary which gives in a few short sentences the substance of the chapter. Such synopses are often found in French treatises and are most acceptable, not only to the student, but to the casual reader.

The treatise considers, first, simple response, and deals with the universality of sensitiveness in plants. This is naturally followed by a consideration of the modification of response under various conditions. Here are studied such matters as fatigue in plants, the effect of anæsthetics, and the death-spasm in plants. Next comes a part devoted to excitability and conductivity, to reversal of normal polar effects in living tissues, to electrotonus, and the latent and "refractory" period. Under multiple and autonomous response the author gathers together the results of his studies on temperature and rhythmic responses in plants, introductory to the larger subject of the different *tropisms*. But, before taking these up, he intercalates two chapters of profound interest, namely, (1) the Ascent of Sap, and (2) Growth. His discussion of the former topic is not wholly satisfactory, but it is extremely suggestive. After the *tropisms* are examined in most of their relations, he ventures on a general survey of the whole matter, in the course of which he has something to say about variation as induced by external forces that throws light on his views of Darwinism.

From the foregoing, it will be seen that

no summary of the work can be given which does not take up all of the author's own summaries and his concluding part (IX.) as well. The whole work must be studied as a unit, and with strict reference to the thesis on which it is based. Nevertheless, there are many incidental results which possess interest for all readers, such, for instance, as the effect of alcohol upon plants in causing temporary exaltation of response, followed by depression and protracted period of recovery. The style of *Datura Alba* was used in these experiments. If the alcohol vapor was blown away and fresh air substituted, the tissues slowly recovered their normal excitability. But if, instead of alcohol vapor, dilute alcohol solution was applied, the depressing effect was immediate and very great.

There is nothing in the treatise to suggest that the work is not the outcome of a physiological laboratory in Europe and from the hands of a physiologist in Germany or England. But the author is an East Indian, much of whose experimental work has been carried on under tropical conditions. The greater part of his material has been found in India, where, as in all tropical countries, vegetation does not have the long periods of hibernation characteristic of the temperate zones. There must have been at his command a wealth of plant-material unavailable to the Northern laboratories, even where these laboratories are supplemented by hot-houses. That the treatise should be free from dreamy conceptions which might be born in India was to be expected by those who are familiar with the work accomplished by Professor Bose in England; in short it is a contribution to physiology possessing high importance in this time of reconstruction of the science. The new conceptions of chemical physics and physical chemistry necessitate a reconsideration of the whole field of the relations of organisms to their surroundings; the present volume is distinctly helpful to this end.

It is proper to call attention to a singular system of nomenclature which the author has made use of in naming his novel apparatus. We have all been cautioned not to combine elements taken from two languages in the formation of technical terms. Such combinations have sometimes been classed with barbarisms. Frequently Latin and Greek are thus combined with grotesque effect, especially in the names of plants. To some of his instruments, Professor Bose has given names which have a novel, not to say grotesque, look. Thus, the apparatus which records the contractile response of the plant just as the myograph records that of the animal, is termed *kunchangraph*, from the Sanskrit *kunchan*, contraction; and the appliance by which the suctional response is measured is called the *shoshungraph*, from the Sanskrit, *shosum*, suction. All the instruments employed in these researches appear to be of great delicacy, and most of them are constructed on new lines. Almost all of them can be fairly well understood from the descriptions; but those who know how difficult it is to build machines from descriptions and sketches merely, will suspend judgment until the work has been repeated in all details. Meanwhile, it may be said that the treatise is stimulating and is likely to be fruitful in controversy. It has

an interest not only for all biologists, but for chemists, physicists, and, we may add, progressive psychologists.

The Nature of Truth: An Essay by Harold H. Joachim. Oxford: Clarendon Press; New York: H. Frowde.

Mr. Joachim's work comes before the philosophic public with the highest credentials. As fellow of Merton College, Oxford, its author has for years been associated with, and enjoyed the stimulating company of, those distinguished philosophers, Prof. A. E. Taylor and F. H. Bradley. He acknowledges how greatly he has been influenced by the latter (though he somewhat sharply criticizes his conception of the relations of logic and metaphysics and of the "symbolic" nature of the "idea") and by Professor Bosanquet. His preface assures us, further, that the greater part of his work "draws its inspiration from Hegel," and that he has received "valuable suggestions" from a fellow of Balliol and a lecturer at Edinburgh. His book has also received the imprimatur of Dr. E. Caird, who encouraged him to persevere in publishing it, while not even Bertrand Russell's criticisms have induced him to make "substantial alterations" in his second chapter. With this array of sponsors we may fairly take Mr. Joachim's book as representative of the profoundest insight into the nature of truth which has yet been attained in the most esoteric circles of Oxonian Hegelism.

And up to a point Mr. Joachim's work fulfils our expectations. It travels, of course, throughout on the high *a-priori* road of a metaphysical assumption as to the nature of truth, which has not the slightest practical bearing on any scientific problem, and never brings it within sight of any question the ordinary man is concerned to raise. Human knowledge it hardly condescends to notice at all; and where it does, it speedily turns away from the disgusting spectacle to "the ideal." For example, we are told (p. 167-8) that "my and your thinking, my and your self" are mere "bubbles on the stream of knowledge," "accidental imperfections, superficial irregularities, in the medium through which truth is reflected," "incidents somehow connected with the known truth, but they themselves and the manner of their connexion are excluded from the theory of knowledge." Moreover, as befits a Hegelian of the "left," Mr. Joachim professes the utmost contempt for the postulation of a God and a future life (p. 166, 176), and other human weaknesses. But his book is a serious and sustained piece of dialectical reasoning, nevertheless, relieved only by a single jest (to the effect that in judgment "the judicial separation expresses a real divorce"), difficult indeed to follow, and needing the reader's closest attention, but working out the consequences of its initial assumptions with the greatest perseverance, and commendably free from the wishy-washy unctious and ambiguous phrase-mongering into which the writings of his school are so apt to lapse.

The trouble is that, at the end of it all, Mr. Joachim has to confess himself beaten. His notion of truth will not work out, and leaves him with only negative results, hoping against hope to escape from skepticism.

But as he is quite honest about this, his failure is very instructive, especially to those who were not free from doubts about his method and are willing to learn a lesson from his conclusion. Even the Hegelian ideal has its "coherence" shattered by the existence of error, and by "the self-diremption of the one significant whole" into a system of discursive judgments other than the truth "about" which it is. Still, Mr. Joachim is reluctant to apply to it the adage, "A miss is as good as a mile." He argues that "it has carried us further into the heart of the problem than either of the two other notions": that truth is "an ideal representation of fact"; and that it is "a quality, or immediate characteristic flavor, of independent entities which are what they are in and for themselves and without relation to mind." Mr. Joachim also argues that the Hegelian idea has maintained itself against difficulties to which these two notions "succumbed" (p. 178). It "suffers shipwreck at the very entrance of the harbor. It has carried us safely over the dangers and difficulties to which the other two notions succumbed, but the voyage ends in disaster, a disaster which is inevitable." For it "involves the recognition that certain demands both *must be* and *cannot be fulfilled*" (p. 171).

All this seems modelled upon, or at all events reads strangely like, J. S. Mill's account of the breakdown of his famous theory of the self, which, he said, "can effectively withstand the most invidious of the arguments directed against it. But groundless as are the extrinsic objections, the theory has intrinsic difficulties which it seems to me beyond the power of metaphysical analysis to remove." It also reminds us of Mr. McTaggart's confession that, in order to account for the course of things in Time, the Hegelian "Dialectic" was still in need of an unknown synthesis. And as the Hegelian refusal to distinguish between them involves metaphysics in the breakdown along with logic, it really looks as though the whole Hegelian line of thought had at last committed the happy dispatch pretty completely.

What, then, is to be done? Shall we acquiesce in skepticism with Mr. Joachim, or turn to a neglected notion of truth to which he had deliberately closed his eyes? His preface had contemptuously dismissed "the theory known alternatively as Pragmatism or Humanism," as having been refuted for all time by Plato's "Theætetus." But in the light of the subsequent proceedings we can well imagine the pragmatists chuckling over Mr. Joachim's results, and congratulating themselves that their theory was left out of his book, and so escaped from the general *débâcle* of truth. Such expert controversialists will be more than human, and less than "humanists," if they do not take an early opportunity of vigorously reminding Mr. Joachim that Plato's "Theætetus," like his own essay, ends in negation and failure, and of pointing out that the refutation of Protagoras is of a somewhat dubious character, and lastly that the collapse of the theories he has examined leaves the logical field most enticingly open to the one which he has declined to go into. In short, the true moral seems to be that the intellectualist notion of truth has once more led to a fiasco. In Mr. Bradley's

"Logic" the fiasco was disguised under an appeal to metaphysics; in Mr. Joachim's essay it is openly avowed; but it is hardly likely that further champions will court a like disaster. However, it is something—more, perhaps, than Mr. Joachim recognizes—to have cleared the ground for a constructive view of truth which keeps in touch with common sense and practical life.

L'Esprit Libéral du Koran. Par César Benattar, El Hadi Sebai, Abdelaziz Et-téalbi. Paris: Ernest Leroux.

The same tendency which phrases itself with us in the cry, "Back to Christ," is appearing in Islam in a recoil from traditionalism to what is taken to be a more literal and historical interpretation of the Koran. Eight hundred years ago al-Ghazzali led a similar revolt, but fatally entangled his movement in ascetic mysticism. A century and a half ago the Wahhabites attempted the same, and produced a mixture of puritanism in conduct, simplicity in faith, and active hostility in attitude towards all non-Muslims and their ideas. Now, the signs are of an attempt to liberalize Islam by showing that the Koran in itself and the traditions from Muhammad are liberal in tone and give no foundation to the proud exclusiveness which has characterized historical Islam—that Muhammad, in fact, was an odd combination of prophet and child of the French Revolution. To bring this home to their coreligionists is the purpose of the present authors. Their thesis is to show, by a rational and literal interpretation of the Koran and the traditions, that Islam does not involve a separation between Muslims and non-Muslims, but, rather, is so liberal in its spirit that it may even afford to all a common platform. Anti-Christian polemics are carefully avoided, but the idea is evident that a rationalized Islam is more universal than any form of Christianity can be. That, however, is a result by the way. The book is addressed rather to Muslims, and is an exhortation to set their house in order by throwing off all the accumulations of superstition and fanaticism which have been heaped up, and by going back to the primal simplicity of their faith. Thus they will be saved from their present intellectual decrepitude and social backwardness, and enabled to take a place in the ranks of progress.

Among the views and practices thus countenanced by the Koran, but annulled by later commentators, are reckoned such as the following: education of all, men and women; recognition and respect for all other monotheistic religions, with full liberty of faith, and belief that there will be salvation and rewards hereafter for all the good; freedom for women, and their equal place beside men, with doing away of the veil; forbidding of the numerous superstitions which have grown up and turned Islam into a polytheism, such as the institution of fraternities and the worship of saints.

That development in religion must always present itself under the guise of a return to the original form seems certain. Whatever the change, it must appear as a reformation. And there is much in Islam which renders this practicable. Muham-

mad, it is true, along with his eternally valid religious ideas, had in him the germs of all kinds of superstitions, but assuredly he would never recognize the present saint-ridden, formalized, lawyer-driven Islam as any creation of his. If he were to appear, the canonists, the commentators, the mystics and the darwishes would be scourged out of the Ka'ba in quick time. To have put their finger on the present nuisance and the menace to all social organization in the darwish fraternities, and on the extent to which thoroughly alien superstitions have completely obscured the original Islam, is a long score to the credit of the present authors. But it is to be feared that the picture of a gentle, tolerant Muhammad which is further drawn, is not in accordance with the facts. Muhammad was of the Old Testament, and would have hewed the priests of Baal in pieces before the Lord; this picture comes from the Gospels. Nor will other of their historical conceptions stand: the early Muslims did not live in the idyllic conditions here suggested, nor was it only with the crusades that the fanaticism of Islam blazed out. The early leaders were possessed by corruption and jealousy like their successors, and Islam was a fighting faith from the capture of Mecca on. Another rock for this thesis lies in the nature of the traditions from Muhammad: in that enormous mass, mostly forged as it is, any one can find support for any dogma, and his opponent can find equally good ground for its rejection. A well-read member of the 'Ulama would have little difficulty in tearing to pieces all that side of this hook. He need only choose what traditions he will quote. Finally, it will be long before the above interpretations of the Koran, though undoubtedly often correct, will make headway against the united authority of the commentators. Belief in the doctrine of the annulment of kindly verses by later ones of the sword will be far too strong. In Christendom rather than Islam will these results be first accepted. But, whether Koranic or not, our hearty good wishes must go with such views and purposes as these.

Robert Browning and Alfred Domett. Edited by F. G. Kenyon. New York: E. P. Dutton & Co. \$1.50 net.

This volume contains some thirty letters from Browning and Joseph Arnould, afterwards judge of the Supreme Court of Bombay, to Alfred Domett-Waring, who notoriously, in 1842, "rather than pace up and down Any longer London Town," went as a colonist to New Zealand. There he remained for thirty years and held several important administrative offices, being premier of the colony in 1862-63. The letters are letters of friends, and are chiefly occupied with the personal doings of the writers and expressions of anxiety and sympathy for the emigrant, whose first years of sojourn in the colony were anything but easy. The Browning student will find some interesting bits, such as Arnould's account (an eyewitness's) of the episode of Macready's production of "A Blot in the 'Scutcheon,'" and one highly significant letter from Browning, of July 13, 1846. Domett had sent the poet some

cautious words about his obscurity and imperfect expression, which Browning admits. "As for the necessity," he writes, "of such endeavor [to rid himself of those defects], I agree with you altogether; from the beginning, I have been used to take a high ground, and say, all endeavor elsewhere is thrown away. Endeavor to think (the real thought), to imagine, to create, or whatever they call it—as well endeavor to add the cubit to your stature! *Nascitur poeta*—and, that conceded to happen, the one object of labor is naturally what you recommend to me, and I to myself—nobody knows better with what indifferent success. But here is, without affectation, the reason why I have gone on so far, although succeeding so indifferently: I felt so instinctively from the beginning that unless I tumbled out the dozen more or less of conceptions, I should bear them about forever, and year by year get straiter and stiffer in those horrible cross-bones with a long name, and at last parturition would be the curse indeed. Mine was the better way, I do calmly believe, for at this moment I feel as everybody does who has worked—in vain? No matter, if the work was real." A sound and encouraging philosophy, not for poets alone!

Browning's own letters are supplemented by those of Joseph Arnould, which, indeed, seem to have been preserved quite as much for what they tell of Browning as for anything else; in some cases the album in which the letters were kept contained copies of only such portions as dealt particularly with Browning. But his letters have still their own interest in telling of his own early career as a barrister, and giving many glimpses of life among the small circle of friends in Camberwell: Browning, Arnould and his wife, Joseph Dowson and his wife, the last-named being Domett's sister. No great doings, indeed, nor much high thinking, but little traits, little incidents, such as life is made of. Two characters stand out more or less clearly: the absent Domett, whom they all hold in cherished memory, talk about, drink a health to, and hope will return; and Browning, the young Browning, frank, warm-hearted, affectionate, "a glorious fellow," as Arnould once calls him. In the last letters in the volume we find the old Browning, the man of the world, the literary personage, much preoccupied, but still the same warm-hearted, affectionate friend.

The Life and Experiences of Sir Henry Enfield Roscoe. Written by Himself. New York: The Macmillan Co. \$4.

This makes the third autobiography of an English pupil of Bunsen, though one of the three never actually worked in that master's laboratory, and the reminiscences of another, a really great chemist, have only been privately printed. Roscoe, if not great, has been unquestionably eminent in inorganic chemistry. His memoir on vanadium is perhaps the most complete and admirable study of an element that has ever been made; for although it was made forty years ago, nothing additional of serious consequence has since been contributed to our knowledge of the chemistry of that metal, excepting the existence of certain compounds belonging to that class of complex inorganic acids which were first ex-

plained and as a class discovered by Dr. Wolcott Gibbs. We must not, however, forget the recent application of vanadium carbide to the production of steel having desirable properties. The photochemical researches of Bunsen and Roscoe are likewise deservedly famous, forming as they do one of the foundation stones of modern chemical dynamics. The interest of the present book, however, lies chiefly in the account it gives of the development in England of scientific education; for it has been in this and other public services that Sir Henry's life has been most valuable.

He joined the faculty of Owens College in its darkest hour in 1857, and labored for it through twenty-eight years, until largely—we may say, chiefly—by his effort, it had blossomed out into the University of Manchester. Subsequently, when the London University needed to be remodelled, he was called to its vice-chancellorship, and under him it took on new and better life. He it was who carried its home from Burlington Gardens to South Kensington. He has done a vast amount of truly patriotic work on several royal commissions on technical education, on secondary education, and on matters of hygiene. He sat in Parliament as an adherent of Gladstone for some ten years, and gives an interesting account of the great man's ascendancy and of its causes. In short, though Roscoe is a very different man from Playfair, and quite opposite to him in several characteristics (among which, we must warn his intending reader, is that of his anecdotes), yet the interest of his volume, beyond the picture it affords of a certain scientific circle, is mainly its carrying on further the narrative of English progress in scientific ideas that is contained in the Memoirs of Lord Playfair.

Mr. Galton has more than once noticed the strongly marked resemblances among the descendants of William Roscoe, author of the Lives of Lorenzo de' Medici and of Leo X., as well as of a monograph upon the Ginger-Arrowroot (-Banana?) family of plants. He was Sir Henry's grandfather. Stanley Jevons was his cousin and intimate friend. He himself has decidedly the traits traditionally attributed to Englishmen (*minus* insularity, however), and, more specifically, of the Lancashire man, who is rather a downright, outspoken, uncompromising person, apt to air his peculiarities, yet easily taking the color of his environment. But even more than other Lancashire men, Sir Henry has always been a sympathetic and highly popular personality.

The dress of the book, like all Roscoe's publications, is pleasing. It contains over seventy reproductions of photographic portraits and views, which are exceptionally perfect as reproductions, as photographs, and as likenesses. The index, on the other hand, is so meagre as to be almost worthless.

Important Nature Books

Slosson's HOW FERNS GROW
With 46 plates by the author. \$3.00 net, by mail \$3.25 (just published).

A book that not only enables fern students to distinguish different species of mature ferns but points out characteristics of the different kinds at all stages of development, and shows the genetic relations of ferns to each other and to the rest of plant life. The plates, nearly all reproducing ferns at their natural size, are particularly excellent.

Water's FERNS of the Northeastern States. Over 200 illustrations. \$3 net, by mail \$3.34.

Kellogg's AMERICAN INSECTS
With 812 figures and 11 colored plates. \$5.00 net, carriage extra.

Jordan's Guide to the Study of FISHES. With 936 illustrations. 2 Vols. \$12.00 net, carriage extra.

Atkinson's MUSHROOMS
With recipes for cooking by Mrs. Rorer and 230 illustrations. \$3 net, by mail \$3.23.

The Nation.

NEW YORK, THURSDAY, JULY 19, 1906.

The Week.

In addition to his general humane impulse to act as peacemaker in Central America, President Roosevelt may well be moved by the desire to prevent the approaching Pan-American Conference at Rio de Janeiro from appearing a failure. With three or four of the constituent nations at war, the impressiveness of the gathering as a peace spectacle would be much cut into. On this and every other ground, it is to be hoped that the good offices of this country may be availed of to avert further bloodshed. The causes of the tri-lateral quarrel are more than usually obscure, even for Central American republics. Apparently, it is one of the wretched contests between military oligarchs over again. With the United States intervening in a friendly way, actively seconded by Mexico, the trouble ought to be composed speedily. Yet the bad conditions will continue; and nominal peace can hardly blind the Rio Congress to the constant liability to war. The general arbitration treaty may be, in consequence, revived. The South American countries are believed to be ready for it. Unhappily, it is the United States that has been backward. The first Pan-American Congress recommended such a common treaty of arbitration, and it won for Mr. Blaine the tremulous thanks of the aged Whittier. But the Senate declined to ratify it. And if Mr. Root were to bring forward the project again at Rio, he would be much embarrassed, not only by that historic fact, but also by President Roosevelt's steady refusal to arbitrate our differences with Colombia, growing out of his ill-considered course when Panama set up for herself.

To clean and progressive Republicans of New York, the present posture of their party affairs must seem ominous. Across the face of the returns of the last election, plain amid the confusion attending other issues, the voters wrote, "We have done with our bosses." But now, within less than a year, there is a stirring in that cave of darkness whither the fugitive bosses fled after last year's storm. Senator Platt once more summons his creatures. Odell, whose share of popular scorn has been more ample than that of any man in public life for a generation, again erects his standard. Lemuel Ely Quigg, banished from public life by a general indignation which even the bosses who employed him could not withstand, sails across the horizon in his yacht. Those

who in the various communities of the State have endeavored to bring a little decency into politics are left by the wayside. When the election is over, bosses may quarrel over the spoils; may scream and denounce some more fortunate plunderer who carries off the lion's share of the booty. But to quarrel when a new election is at hand, to risk the loss of all the plunder—this is not the way of the boss. Each party is waiting for the other—waiting for it to do its worst. Odell and Platt in unison ought to sink any ticket; but, then, the Republican bosses are hoping that Hearst will frighten enough decent people into their arms to save the day.

The Hearst plan of campaign for the Governorship of New York is now pretty clearly disclosed—a matter of serious consideration far beyond the boundaries of this State. His first assault is to be upon the Democratic nomination. He has suddenly become "regular." The resolutions in his favor which his agents supplied the Broome County convention on Saturday, state that he is "a lifelong Democrat," who has "invariably been a loyal supporter of national and State Democratic nominees" (municipal nominees not mentioned). Hence the appropriateness of a Hearst demand that the Democratic party make him its candidate. The first proud scheme of a separate nomination by the Independence League has been quietly dropped. If Hearst gets the regular party nomination, he will continue to be a lifelong Democrat; if not, he will immediately become a lifelong bolter. In either case, the prospect is not pleasant for New York Democrats. They have to face a formidable attack. The Democratic organization throughout the State became degraded to the level of the boss—David B. Hill—to whom it was for so many years subservient, and when he dropped it, the purchase of its fag-ends was comparatively easy. The chief resource of Hearst, next to money, is clamor. His campaign is distinctly planned to win success by the slum and rowdy vote of both parties. His aim is to marshal the discontented, the credulous, the purchaseable, the riff-raff of all parties. Unless self-respecting Democrats bestir themselves, they will see the Democracy of New York, which has fed upon the fair mountain with Tilden and Cleveland, battening upon the moor with Hearst.

A rare virtue attaches to the protest of Mrs. Mary Schauffier Labaree against the action of our Government in exacting an indemnity of \$50,000 from Persia for the killing of her husband, a mis-

sionary, by native religious fanatics. Recognizing her right as an American citizen to such indemnity, she preferred to waive it for the sake of the mission cause, which is as dear to her as it was to her murdered husband. The matter, she pointed out, would not be understood by the Persians, who would speak of it as "blood money"; and this forcible extortion by the United States of payment might thus do "serious and lasting injury" to Christian missions in Persia. Such considerations could not, of course, weigh with an Administration bent upon upholding our dignity abroad. The money was collected, though as a special grace our Minister obtained a promise that it should not be levied as a peculiar tax upon the inhabitants of the province where the murder took place. But Mrs. Labaree's spirit is certainly a better exponent of Christianity than a thousand sermons. It does not, we regret to say, always characterize missionary boards. Some of their demands for rough action by this country in heathen lands Secretary Hay was known to characterize as "bloodthirsty."

The tabular statement of the year's appropriations which is now printed in the *Congressional Record*, shows that the House has not asserted itself in money matters against the Senate quite so successfully as in the past few years. To the supply bills as passed by the House, the Senate added, following its custom, the sum of \$22,185,682. It was the business of the several conference committees to decide how much of the amount, after the House had decided "this much and no more," should remain in the bill for the President's signature. Mr. Cannon went into the Speakership with very decided ideas of his own about standing up for the rights of the House. The first years he backed up the House representatives in the conferences, and met with gratifying success. This year, perhaps, the demands of general legislation tended rather to weaken the grip on appropriations. At all events, besides increasing at a larger rate than in former years, the appropriations have conformed very much more nearly to the Senate's than the House's desires. Out of the twenty-two millions embraced in Senate amendments \$16,281,131 was carried by the law as finally passed. This means that the Senate, which, judged by this test, had been losing ground steadily for four years, has renewed its old-time successes in getting appropriations. We are back to the good old days when the Senate regularly got some three-fourths of the additions it asked for. And, as the Senate went beyond the other body this year in

hard work and popular legislation, it may have deserved what it got.

The only hitch in the plans of Vice-President Fairbanks for winning, this summer, the support of the farmers occurred last week, when his automobile ran down the buggy of a Democrat. Doubtless, Mr. Fairbanks meant to clothe himself in jeans and a wide straw hat, and shoulder a hay-fork before getting into the news dispatches or in front of the camera. Now it is a fair question, "Is this son of the soil, who journeys to his hayfield in a touring car, the 'real thing'?" Regarding certain other statesmen lately in the public eye there is no doubt. When Andrew L. Harris succeeded to the Governorship of Ohio the other day, he was engaged in relaying the stone foundations of a barn on his farm in Preble County. Dropping his tools, he packed a bag, seized a coat and umbrella, and, despite his seventy years, strode off briskly to catch a trolley car for the nearest railway station. The barn is yet unfinished, and the tools are rusting where they were dropped. Gov. Harris's one expression of regret, when he is mentioned as the Republican candidate to succeed himself, is that he can't go back to the farm and finish that job. Mr. Curn of Kansas, a better friend to the cow than to the country, since he refused a Senatorship in order to keep his job as Secretary of the State Board of Agriculture, is another genuine agricultural product. But Mr. Fairbanks—the automobile story makes us doubt him.

Although a general election in Germany is still distant, politicians there are ever watching to see whether the growth of the Socialist party is continuing. Two recent elections have thrown some light on the movement of public opinion. In Hanover the Socialists elected their candidate by 31,803 votes, against 30,596 for the four other candidates, showing, for the first time since the election of 1903, a handsome gain. But their increase was not so great relatively as that of the National Liberals nor their majority so large as three years ago. In Altena-Iserlohn, where the other contest took place, a second election became necessary between the Centre and the Socialists. Owing to the failure to bring about the usual combination of the other parties, the Socialists again won an unexpected and decisive victory and obtained a seat they had never before held. In revenge for this failure of the Liberals to support the Centre, the latter party has informed its followers that they may vote, if they please, for the Socialist candidate to-day, when the seat so long held for the Radicals by Eugene Richter is to be filled. From all indications, therefore, his successor is like-

ly to be a follower of Bebel. Three successive Socialist victories would make the conservative parties and court circles distinctly uncomfortable.

All that human justice can do to right the world-echoing wrongs of Capt. Dreyfus has now been done. The highest court in France at last decides that there never was any case against him; that the Rennes trial was vitiated by forged evidence and monstrous inference from trifles light as air; and that he is now entitled to stand forth legally, as he always has been morally, innocent. The decision carries with it restoration of military rank, though Dreyfus, we presume, will not care for that. Vindication is what he and his friends have asked all these weary and terrible years, and finally they have it complete. No formal redress is possible for the sufferings of the victim on Devil's Island, or for the ferocious ostracism to which he has been so long subjected, but his name and fame are forever cleared, and that is the great result which the heroic men—Reinach, Zola, Col. Picquart, and the others—who identified themselves with Dreyfus's case all along sought. France used to resent the intense interest of other nations in this celebrated case; but she will not spurn the congratulations of the world on the fact that her courts have known how to make justice shine forth as the noonday.

An income tax in France, which was voted last Friday by the Chamber after the Minister of Finance had declared that otherwise he would resign, was advocated as an absolute necessity. The fiscal year ended with a large deficit—no less than \$75,000,000. While that has to be provided for, the budget for 1907 carries, nevertheless, increased expenses of some \$60,000,000—bringing the total for the first time above the \$800,000,000 mark. Such augmented expenditures M. Poincaré asserted to be "inevitable," and our own melancholy experience does not allow us to say him nay. But if outlay cannot come down, receipts must go up. Hence the income tax. It had not been imposed in France since the years after the war with Germany, when the milliards of indemnity had to be paid. Then it was spoken of as a merely "temporary" tax, which after its immediate purpose was served, would not be resorted to, except as a resource in time of war. But here it comes *en pleine paix*. Such are the demands which modern democracy is everywhere making upon the purse of the nation. There is, at any rate, this advantage about an income tax, as compared with the concealed operation of tariff taxes, that it enables people to see clearly who have to put the money into the purse.

The English "suffragettes"—as they are jestingly called—are going at it in earnest. Nearly every day brings news of a fresh demonstration of their desire for the ballot. Lady Frances Balfour, who believes in quiet and orderly campaigning, and Miss Billington, who leads the violent faction, alike feel themselves the victims of a grave injustice, and they are determined that this Parliament shall not expire without voting on the question. They have much to encourage them. On May 19, the Prime Minister received an impressive suffrage delegation and, though giving no pledge of action by his Government, avowed his sympathy with their cause. No English statesman ever went so far. The fact is that English politicians, though they may deprecate the movement, have themselves encouraged their sisters to enter political fields. It was Lord Randolph Churchill who organized them in the Primrose League, and in every subsequent election women have played a prominent part, not only in canvassing, but upon the platform. Their aid is now regularly sought by both parties. Naturally, they who are urged to make others vote demand the ballot for themselves. Moreover, English workingwomen have been drawn into the cause to a surprising degree. Unorganized and often underpaid, these women believe that their hard lot would be improved if they could but impress politicians by their votes. The Liberal press is sympathetic enough to give the "suffragettes" all the space they ask. The contrast between the status of the movement in this country and in England is obvious. Here few men in our national political life have professed sympathy for the cause, and fewer could be got to attend a meeting to urge it.

The suicide of an English barmaid, eighteen years of age, because she had fallen a victim to the drink habit, has once more deeply stirred the conscience of England. The incident may lead to legislation similar to the Glasgow ordinance forbidding the employment of girls as barmaids. To Americans the idea of a woman's serving as bartender is revolutionary, if not revolting. The English public-house of the better class is, however, in many respects so superior to our saloon that this employment has for centuries been monopolized by women. Not until recent years has there been a systematic effort to exclude girls from this trade. The Church of England Temperance Association and the British Women's Temperance Society have been agitating the subject; and a voluntary "Joint Committee on the Employment of Barmaids" has published a number of reports embodying the results of careful investigation. These prove beyond doubt that, even under the most favorable condi-

tions, this employment is degrading. According to the Joint Committee's latest pamphlet, there were 27,700 barmaids in 1901, of whom 6,225 were under the age of 20, and 12,023 were between the ages of 20 and 25. The business requires youthful and attractive victims, for their good looks are expected to bring in much custom. Hence there are few barmaids over 35. The bar hours are abominably long, and in themselves would wreck the health of the women. Public houses in the London Metropolitan District are open no less than 19½ hours on week days; and in many resorts the barmaid is expected to be on hand practically from the opening until closing, save for a couple of hours for rest and meal time. The consequent fatigue is most readily combated by recourse to stimulants. An expert witness quoted by the Joint Committee stated that "75 per cent. of the barmaids are intemperate." Immorality is an almost necessary consequence, particularly as a woman who has been employed in a public-house finds it generally impossible to obtain respectable work elsewhere. Indeed, so overwhelming is the indictment of the calling as to make it incredible that reputable English newspapers should still defend it.

Ouida is begging the headmaster of Eton not to allow his pupils to indulge in the "unsupportably brutal" pastime of hunting hares. The Society for the Prevention of Cruelty to Animals is asking in England for an Animal Sunday, after the fashion of Hospital Sunday. The hope is to secure public instruction in our duty to dumb creatures. The consideration now shown for the feelings of the lower animals is the result of long and slow moral progress. Schopenhauer bitterly reproached both Judaism and Christianity for their shortcomings in this respect. It must be admitted that the earlier Christian ethics neglected the whole subject. A great gulf was supposed to separate the heaven-born soul of man and the blind instinct of the brute. But there has been improvement, however gradual. Certain sports which afforded amusement to our ancestors, such as dog fights and cock fights, as well as the baiting of bears and bulls, are becoming rare. The clay pigeon has been widely substituted for the live bird. Cattle on their way to the slaughter must be transported without cruelty. The galled back of the horse, the broken leg of the dog, and even the hunger of the cat are no longer *minima* of which it can be said that the law is heedless. This increased sensitiveness of the public conscience is part of the general humanitarian movement which marks this era. The theory of evolution also has indirectly been a corrective of the ideas of man's irre-

sponsibility to the lower organisms. The demonstration of the unity of the whole organic world has made men understand as never before their real affinity with every living thing. Certain hunters, after killing monkeys, have felt themselves to be but little better than murderers. There is, however, still a considerable field for reform in the treatment of the lower animals.

One development of English railroading is as well worth attention as the Salisbury catastrophe. What is known as the "day cheap trip" is more popular than ever, and the railway companies are competing for the patronage of the great public that likes to travel a long distance for a comparatively small sum. The Great Western Railway, for instance, issues return tickets between London and Weston-super-Mare (113 miles) for one dollar, and carries passengers each way in about two hours without a stop. Places like Brighton, Margate, Hastings, Skegness, Yarmouth, Blackpool, Southport, and Morecambe are visited every day by thousands of people who have been conveyed from city to sea in well-appointed trains at low rates; indeed, Blackpool, by far the most popular seaside resort in Great Britain, depends very largely upon the "cheap-tripper." On the last Saturday in April 60,000 people journeyed from Lancashire and the Newcastle district to London to see a football match, at return fares ranging from 10 to 15 shillings. An excursion of this kind means two nights in the train and about eighteen hours of sightseeing. But the cheap-tripper has a tendency to favor excursions which entail a tax upon the powers of endurance. Not long ago 700 workmen of Burnley participated in a "day-trip" to Paris. During the forty-three hours they were away from home, they travelled a thousand miles by land and sea, kept continually moving while in the French capital, and paraded four deep before the President. And these noble 700 have the satisfaction of knowing that for the rest of their days they will be regarded by friends and acquaintances as men who have seen "foreign parts."

An antiquated method of building up an institution of higher learning is described in the recently published life of Augustus Austen Leigh, late provost of King's College, Cambridge. Forty years ago King's, though wealthy and possessed of fine buildings, was, as one writer describes it, "not only ineffective, but notoriously useless." The lives led by some of its members were "vacuous and indolent, even, in certain cases, grossly scandalous." To-day, on the other hand, King's is "one of the most active intellectual bodies in the King-

dom." This change was due to Provost Leigh, and yet he instituted no drastic or stringent reforms. He had no novel educational programme. He disliked public appearances, and made no reputation either as a writer or a speaker. He was as far as possible from the type of educational hustler and advertiser, now in demand for the presidency of an American college. He seems to have been ignorant of our theory that peripatetic glee clubs and victorious athletic teams are the twin props of a university. With a simplicity that is almost pathetic he bent his whole energy to making the teaching force as efficient as possible, to developing the intellectual resources of King's. Quietly he took one department after another and strengthened it. He kept his eyes fixed on his goal; he was never in a hurry; never lost courage; was never impatient. We do not mean to say that "Steady and sure" would be equally useful in an American college of the twentieth century. That motto, however, has been President Eliot's, and he is thought to have had some success at Harvard.

Amateur golf has apparently sustained its reputation for producing something like a miracle each year, in the defeat of Champion Egan in the second round of the tournament just closed. But the surprise was not so great as it might seem. Experts have commonly said that when Egan had to appear on links where he must play straight, he would be beaten easily. He has been the type of the brilliant but erratic player, with a very long ball too subject to slicing or pulling, though usually with an astonishing power of recovery from the resulting bad lies. But the better golf courses are to-day being steadily constructed so as to punish severely that style of execution. Side traps and pits, with the rough grass narrowing in, have put a premium upon straight and steady playing, which is as great as the penalty visited upon the golfer with tremendous distance but poor direction. Doubtless, the thing is sometimes overdone. On some links the hazards lie too thick. A really good ball may be unjustly penalized. That is said to have been the case here and there at Englewood. But the general tendency is wholesome. It is as marked abroad as it is here—though even of the new St. Andrews some complain that it has been made too hard. Yet it is well, on the whole, to make the golfer's salvation lie through the strait gate. The result of the tournament, by which Mr. Byers barely kept the championship from going to Mr. Lyon, the Canadian, was regarded as a crowning mercy by orthodox golfers—not because Mr. Lyon was a foreigner, but because his formidable game violated nearly all the approved maxims.

PRIMARY LAWS AND PARTY TACTICS.

This year sees the first real trials of the direct primary on a wide scale, and in States where the parties are somewhat evenly balanced. Oregon made direct nominations this spring for all offices, including United States Senators; and the election for State officers and Congressmen was held in June. The Michigan Democrats have nominated their candidate for the Governorship by direct vote. In September, Wisconsin is, for the first time, to try its nominations law, one of the three most complete in the country, in nominating State officers; while under the new Illinois law, primaries are to be held for every office, including the United States Senatorship. In Iowa and New Jersey, which have the legalized but not the direct primary, contests are in progress upon such definite lines that the conventions will merely record the will of the voters as expressed on primary day.

Now that the politicians in so many Northern States are compelled to conduct campaigns under the new system, they are already forced to considerable modifications of the old strategy. Direct nominations obviously eliminate such devices as stampeding a convention, trumping up contests for seats, and the cruder dickering and trading of votes. According to the experience of cities which have used it, the direct primary also doubles, triples, or quadruples the number of voters who participate in the making of nominations, a result which alone would offset most of the faults charged against the new system.

But besides these there are considerations of major tactics. One of the commonest methods of defeating a strong candidate for nomination has always been to put up against him a group of candidates, each drawing votes through his local popularity, so that the first ballot in convention will fail of a choice. Then the opponents of the leading candidate combine on one man, and the thing is done. That was the scheme employed in the effort to beat Folk in Missouri. The president of the Jefferson Club in St. Louis, the popular Mayor of Kansas City, and a Supreme Court judge with a war record made their campaigns separately, expecting to find their aggregate vote larger than Folk's; but they were disappointed. In the same way the movement against Chairman Babcock of the Republican Congressional Committee employed a different candidate against him from every county. This method of fighting is now outlawed by a more effective decree than any Hague conference would make. A faction is compelled to vote in the primary for the man it wants to nominate and elect. A candidate who has a third of the votes to start with cannot be beat-

er by dividing the remainder among three rivals. This makes for frankness and honesty; for "piecemeal" campaigning is never inspiring.

On the other hand, the direct primary tends to discourage independent candidates with small following. If many of them appear in the field, the votes are so scattered that the primary does not voice clearly the sentiment of the party. Thus there may be necessity for a preliminary agreement on candidates, or some means of setting aside plurality nominations. Some of the existing laws require the calling of a delegate convention when no candidate in the primary has a majority. The plan by which voters indicate their second choice, though defeated in Wisconsin last year, seems a fairer and more logical way of surmounting the same difficulty. No primary law now in force, however, has this feature.

Meanwhile, where anything at all besides personalities is at stake, a makeshift solution has to be found in the elimination of distracting candidates. If, for instance, the old "Stalwart" faction proved formidable in Wisconsin this year, it might win unless the opposing "Half-breeds" could concentrate their whole strength upon one or two candidates; that is, persuade all others to withdraw. In the South, except when, as in the current Georgia campaign, there is a clear field and no candidate for reflection, "two-cornered" primaries are decidedly the rule. Senators and Representatives, especially, seem to hold their official honors like so many athletic championships, and aspirants challenge them single-handed, as Hobson did Bankhead, or Gov. Taylor Senator Carmack of Tennessee. Where the fight is over a definite issue, under the direct primary, it is especially necessary that each side choose its man before the fray begins.

That is the chief reason for the peculiar sort of pre-primary conventions which are being developed. The Wisconsin Democrats, for instance, held a State convention last month. This was not to nominate candidates; and even the platform in that State is, under the law, to be formulated by the candidates themselves. It resembled rather a general rally. "It is conceded," says one report in a Republican paper, "that the Democrats have secured an initial advantage by having come together and discussed the issues and the conditions which prevail throughout the State, and received that impetus to work for the party which comes from meeting each other in convention." The direct-primary States are likely to hear a good deal of this last point.

Perhaps it is not fair to say that the direct primary weakens party allegiance. But it has come at a time when appeals to "regularity" as an end in

itself are losing much of their effect. There is no visible danger to the party organizations, but they are already facing a change in the basis on which they must be maintained.

DEALING WITH THE TURK.

One almost regrets that the Administration will not, after all, make the Sultan receive an American Ambassador at the point of the bayonet. The first announcement was that the President would stand no nonsense from the Sultan, but that, having got Congress to pass a law raising the legation at Constantinople to the rank of an embassy, he would proceed to insist upon Minister Leishman's reception as an Ambassador, if it took a squadron to do it. This opened up the prospect that a new chapter would be written in international law, showing that the aim of modern diplomacy is to keep as representative near other sovereigns, not a *persona grata*, but a *persona invitissima*. The State Department, however, has given that story its quietus, tamely acquiescing in the old view that diplomatic relations are for common agreement between nations, that it takes two to make an Ambassador, and that, in this matter, the White House must wait on the pleasure of the Yildiz Kiosk.

There is something a little innocent in the idea that we could transact our business with the Turk much better if we could only persuade him to receive an Ambassador. The reason given is, of course, that a mere Minister has to cool his heels in an ante-room, while Ambassadors claim precedence and pass in first to the awful presence. But the real question is how they fare when they get in. Great Britain and the chief Continental countries have Ambassadors at Constantinople, yet we do not observe that their complaints about the slipperiness and dilatoriness of Abdul Hamid are any fainter than our own. The recent ultimatum sent to Turkey by Great Britain, over the occupation of Tabah, could just as well have been delivered by a Minister, or even a messenger. A Sultan who is determined to refuse satisfaction and to put off every decision to the last day possible, will find excuses even when face to face with an Ambassador. And if it is a question of browbeating him, there is the example of our own Minister Terrell to show what heroic things can be done by a determined man without ambassadorial rank. He stood boldly up in the palace, in 1895, when checked by some minion of a Pasha, and said, "Go tell your royal master that I have come in the name of 70,000,000 American sovereigns to say to him that he must save his country from the devil, or it will be bad for Turkey."

Our own claims, which the Sultan has so long adjourned, relate chiefly to in-

demnities for missionary property destroyed by mobs. But he is treating our appeals for money just as he does every one's. For at least a hundred years the Turkish Treasury has not yielded a piastre except on compulsion. The army is not paid, contractors do not get their funds, even full interest on the foreign debt is not forthcoming until every shift and pretence in order to secure delay have been exhausted. Our plight is not singular; and, as we say, it would be strange indeed if the Sultan's consenting to receive an Ambassador would bring his evasions and pretexts to an end, and put us on a better footing than other nations.

Some of the recent difficulties in dealing with the Turk were brought out strikingly in a debate the other day in the House of Lords. The joint financial control of Macedonia is not working well. This was forced upon Turkey by the Powers, it will be remembered, only after a naval demonstration had overawed the Sultan. But it is one thing to get the Turks to assent to a programme, quite another to induce them to carry it out honestly. Lord Newton read out a letter which he had received from an exceptionally well-informed resident of Macedonia. In it occurred this passage:

Things are not going on well. There is going to be a suspension of payment tomorrow. General de Giorgis can get nothing done. I do not think we shall have any general rising this year, but it is inevitable later on, and I cannot but think that the sooner it comes the better it will be for all parties. At present people are being killed uselessly at the rate of 200 a month, and good honest war would be far less demoralizing.

This deficit in the Macedonian budget is craftily made use of by the Turkish officials to propose an increase in customs duties. As Lord Fitzmaurice, speaking for the Government, pointed out, "there was no reason to be astonished that the trained diplomatists of the Ottoman Empire, when called upon to introduce reforms into Macedonia, took the opportunity of telling the Foreign Office how very desirable it would be to let them have a little more money." The Turks have a seemingly good case. If the intervention of the Powers has cut off part of their Macedonian revenues, there is nothing for it but to levy higher rates on the goods which the Powers export to Turkey. Hence the desired advance of the Turkish customs. It is expected to raise an additional \$3,750,000 for the Turkish Government. Of this, 35 per cent. would, under international agreement, have to go to bondholders; but there is objection to letting Turkey use up even the rest. Turkish finance is a confused mess at best, and the Powers are insisting that if any new sum is available, it should be devoted to settling arrears. Besides, as was openly said in Parliament, "if the Turks once tasted the joy

of an 8 per cent. tariff, they would not relinquish it except under extreme pressure." So England and Austria and Germany are protesting and negotiating and feeling their way; and the fact that they have Ambassadors at Constantinople does not appear to be a solution of their difficulties.

THE MATTER WITH WALL STREET.

That Wall Street is ill—or, at least, complaining of being "all run down"—has been evident for some weeks. Its disease, whatever it may be, is all the more cruel because so mysterious. Wall Street feels that it ought to be in blooming health. Instead of the depressed sensation which it has so frequently suffered of late, it believes that it ought to be buoyant and overflowing with vigor. Nearly every business sign is not merely good, but excellent. General trade is flourishing. Railroad earnings are large. The promise of good crops at high prices is flattering. Under such conditions, the Wall Street barometer ought surely to be set "fair," instead of falling so frequently and alarmingly to "storm."

The puzzling nature of the Stock Exchange ailment has, of course, furnished a glorious opportunity to the financial doctors. They have gathered about the patient bent on making the true diagnosis. But *quot medici, tot sententia*. There are many violent opinions, but no agreement. Among the Wall Street physicians who are always looking for a god from the machine there is, however, a consensus that, whatever else may have contributed to depress stocks, the chief trouble is too much Roosevelt. Many bankers, brokers, and promoters are bitter toward the "rash and meddling" President, who has "killed the market." For this common opinion of Wall Street the compilers of financial statistics can make out a *prima facie* argument in the familiar *post hoc ergo propter hoc* style. Here is a table showing what has happened to typical standard securities and also speculative stocks since the President sent in his message about the beef business on June 4; it may be noted that the market has rallied somewhat this week:

	June 4.	July 18.	
Great Northern	307½	288	-19½
Reading	143½	119¾	-23¾
New York Central.....	141	131	-10
Pennsylvania	133¾	125¼	-8¾
Union Pacific	152½	143½	-9
St. Paul	174¾	175¼	+ ½
U. S. Steel	41½	34¼	-7¼
U. S. Steel preferred..	106¾	101¾	-5
Amalgamated	109¾	96	-13¾
Brooklyn Rapid Transit.	84¾	72¼	-12¾
American Smelting	157¼	143½	-13¾

A downward lurch also dated from June 25, just after the President had announced his intention to prosecute the Standard Oil Company, and possibly the Pennsylvania Railroad Company. This incident brings in a variant of the theory of Mr. Roosevelt's responsibility

as a disturber of traffic. It is that the incensed "Standard Oil crowd" and angry railway interests went into the market to slaughter stocks (including their own) in order to "teach the President a lesson." It is, of course, further proof of the diseased condition of Wall Street's mind that it could believe this. No doubt that the Standard folk would like to undertake Mr. Roosevelt's education, but we can scarcely imagine them eager to pay out of their own pocket his school bills running into scores of millions. Still, there is the tell-tale table, of the most deadly before-and-after kind; and how, in the face of the damning figures, can any man with half an eye deny that the President is guilty?

Indubitably, the President's course, like any other event causing disquiet and apprehension, would tend to deflate a highly blown market. If prices were kept up by reckless speculation six weeks ago, the shock given by Mr. Roosevelt may have been the signal to set them tumbling, though the really efficient causes were many, complex, and partly hidden. And there is, we think, good evidence that speculative manipulation of the market had been too venturesome. It did not reckon with Mr. Roosevelt, to be sure, and is still assigning the fact that "no one can tell what that man will do next" as the vexatious cause of financial depression; but neither did it reckon with other forces which it ought to have taken into account. It was going blithely upon the assumption that money would continue easy, although there were many signs of a coming stringency. New York does not appear to have been so alert as Paris and Berlin and London to the immense financial significance of the Russian revolution—for such, as Anatole Leroy-Beaulieu truly asserts, we must now call it. That cloud on the market was a plain warning to be cautious, but our speculators were jauntily daring. They did not perceive the lesson of the fact that American railroad loans had to be placed abroad, or detect the peril of the real-estate speculation that has mounted to such heights in so many parts of the country. In the face of such clear danger-signals, portending high rates for money, the Wall Street "boom" went merrily on until the demonstration suddenly came that it was hollow. President Roosevelt may or may not have been the immediate cause of revealing the real state of things. If it had not been he, some one else, or some event, would soon have done the work; for the true causes were all the while operative, and the result was bound to follow.

We may wisely distrust the man who confidently offers us a single skeleton key to fit the complicated wards of the financial lock. Large and continuing effects imply general causes. The present cry of Pittsburgh, "Roosevelt is killing

prosperity," sounds more of pettishness than philosophy. In a broad way, this country is suffering financially from thinking to eat its cake and have it, too. The idea has been to screw up wages, prices, profits, all around; to set and keep up a luxurious standard of expenditure; to despise saving and small but sure gains, and to use up our capital faster than it accumulates. If that is folly in an individual, it cannot be wisdom in a whole people. In the end, the spendthrift has to apply to the prudent, as the lavish American is now applying to the thrifty Frenchman.

A SUCCESSFUL PROFESSIONAL CAREER.

"Walter Reed and Yellow Fever" is the title of a book in which Dr. Howard A. Kelly of Johns Hopkins tells the story of a successful professional career. Success in this case, as every one knows, did not consist in building up a large, fashionable, and lucrative private practice; in conducting a popular sanitarium, or in being able to charge enormous fees for surgical operations. Doctors who achieve these ends are commonly pointed out as having won the prizes in medicine; but there is another point of view. Dr. Reed spent eighteen years as an army surgeon in garrison—most of the time in the Far West. When he died at the age of fifty-one his annual pay was less than \$3,000; and his last hours were haunted by the fear that his family was ill-provided for. Yet his life throughout was happy and useful, and crowned at the end with brilliant achievement.

Dr. Kelly's narrative is of deep interest to both physician and layman. Walter Reed was born in Virginia in 1851; and at the age of eighteen he graduated from the Medical School of the University of Virginia. For the next six years he was attached to various hospitals in New York; in 1875 he obtained a position in the Medical Corps of the army, and in the following May he went to Fort Lowell, Arizona; later he was at Camp Apache, seven hundred miles from a railway. The hardships which he and his wife endured are the subject of many graphic pages. Generally he was the only physician at the station, and he was called upon by the settlers for miles around. At one period, when he himself was ill with fever, he insisted on responding to any urgent call. For lack of strength he would be repeatedly forced to sit down while dressing, and finally he would start out "with the snow deep on the ground and the thermometer far below zero." "The more humble the patient," says his biographer, "the greater his devotion." He was especially attached to children. Once he brought into camp a little Indian girl so terribly burned that her people had left her to die. He succeed-

ed in saving her, and brought her up in his own family as nurse to his children.

After thirteen years of Western life came his opportunity. Feeling that he needed time for more study, he obtained appointment as attending surgeon and examiner of recruits in Baltimore, with permission to pursue professional work at the Johns Hopkins Hospital. There he gave himself mainly to pathology and bacteriology, in which he showed marked promise. From 1891 to 1893 he was again in the West; then he was made curator of the Army Medical Museum and professor of bacteriology and clinical microscopy in the Army Medical School. He now began his career as a scientific man. He studied diphtheria, and did everything in his power to advance the use of antitoxin as a remedy. When typhoid broke out among the soldiers at the time of the Spanish war, he was made chairman of a committee to investigate the epidemics. The committee report, in two large volumes, is described by Dr. Kelly as "a monumental work, which will always be of value as a basis of future study in the epidemiology of typhoid fever."

As early as 1897 he had paid some attention to yellow fever. When in 1900 the disease appeared among our soldiers at Havana, Dr. Reed was appointed chairman of a commission to study this plague of the tropics and semi-tropics. Various theories had been propounded as to the cause of infection: that the fever tainted the air, or that it was conveyed by contact with a patient or with his clothing. Dr. Carlos J. Finlay of Havana believed that the mosquito carried the germs; but he had been unable to offer convincing proof. The labor of Dr. Reed and his commission we cannot here take up in detail; but we must at least mention the heroism of those soldiers and physicians who volunteered for inoculation by the bite of a mosquito. Dr. Jesse William Lazear, "with more than the courage and devotion of a squire, risked and lost his life." All the members of the commission were in constant peril. Finally, they made clear beyond cavil the fact that the mosquito *C. fasciatus* is the intermediate host for the parasite of yellow fever. Dr. Reed's exultation as he saw his experiments drawing to a triumphant conclusion is revealed in several letters to his wife. Once he says: "I could shout for very joy that Heaven has permitted me to establish this wonderful way of propagating yellow fever." A few weeks later he writes:

The prayer that has been mine for twenty years, that I might be permitted in some way or at some time to do something to alleviate human suffering, has been granted!

Dr. Reed, worn with toil, died in 1902 after an operation for appendicitis. That he had his recompense, rich and abundant, in this life, none can doubt. The

joy of the scientist as he unveils even a relatively unimportant truth cannot be measured in terms of money, or what money will buy. Only those who have caught glimpses of the beatific vision can conceive the emotion of Dr. Reed at the thought that he had done more for medicine than any American has ever done; that he had stayed one of the most fearful of scourges, and saved countless lives. In a day when the allurements of commerce are more potent than ever before, its rewards huger and more dazzling, such a book as this should be put into the hands of aspiring youth. From it they will learn the difference between the shadows of the flesh and the realities of the spirit.

REMBRANDT AFTER THREE CENTURIES.

During his own life, Rembrandt's fame, once considerable, sank into obscurity. For a full century later he was almost forgotten. His was the fate of all artists at odds with their times. How this great visionary came to be the consummate master of the Dutch school, and withal the least Dutch of its masters, remains something of an enigma. On this point, the modern eulogists differ as widely as the older critics. He is lauded as a precursor of impressionism, as a profound portraitist, as the truest interpreter of Bible story, as the greatest of etchers, even as a masterful colorist. Some have boldly hailed him as the chief of naturalists. Many of these things Rembrandt was—so inclusive was his life work; all of them he might have been—so versatile and persistent was his genius. Painters, who are likely to be right in such matters, regard him as the inventor of a peculiarly rich and vibrant *chiaroscuro*, which became a remarkable medium of expression—hinting at the mystery of personality, and containing, as it were, all the springs of human pathos.

On the technical side Taine said the last word of Rembrandt's characteristic style—namely, "his figures swim in the air, like a fish in the water"; or, again, "the atmosphere is the principal personage of the picture." Such statements should be accepted with a difference; they do emphatically point the truth that every late canvas of the master is a battlefield, in which the shadow surges up to the tiny citadel held by the high light, which in turn resists the gloom and struggles outwards through the deepest shadows, being always conqueror in the end. Similarly his figures do not assert themselves brusquely and once for all in fixed contours, but grow out of the darkness as a kind of emanation. The eye never completely ascertains them, but reveals them increasingly, as forms are divined at twilight. Nothing seems set and arranged for the convenience of the onlooker, of whom

is required something of the visionary quality of the artist. With considerable technical differences, Whistler and Carrière have sought the same effect of an evasive reality.

It is important to note that the mystery of Rembrandt, his effacement of the line and simplification of the masses, is based on a perfect knowledge of the actual forms. One has only to compare the early "Anatomy Lesson" with the later "Syndics" to perceive that the contrast is not between representing forms and neglecting them, but between two kinds of representation, of which the later is both the more difficult and the more accurate. The clinic of Dr. Tulp is painted with a solidity and relief almost scriptural, suggesting, in fact, the touch of the finger rather than the observation of the eye. Each head is painted as if seen by itself; there is no charm of color; the merit lies in superb academic draughtsmanship, in grasp of character, and, negatively, in suppression of the more revolting features of the subject. In such a picture Rembrandt appears as cautious and laborious, a formidable rival to the Van der Heists and other "corporation" painters, but essentially of their sort, after all. In the "Syndics," painted at the end of his career, there is greater actuality and unity—the glamour and mystery in which these grave committeemen are invested strangely contributing to the sense that these are substantial presences. In short, following the almost universal course of successful genius, Rembrandt prevailed by means of a conscientious academic tutelage, the minute method of which he finally abandoned. He is successful in putting his own passionate vision of the world upon canvas, because first he has mastered the dry record of the average eye.

In Rembrandt's etchings—the peddling of which kept him afloat through disastrous years—the real Rembrandt, the Rembrandt of mystery and of the searching, yet fluttering eye, appears much earlier than in the paintings. The etched line indicates the whole character of the pose, the suffusion of the figure with light, the tremor that indicates motion incipient or just arrested. A very little study of the etchings will show how early Rembrandt came to that curiously profound and troubled vision by which we know him best. The fact suggests that his earlier and dryer portraits represent, as one might suppose, less his natural predilection than a conscious apprenticeship to the distasteful but indispensable severities of his art.

If criticism of Rembrandt's finished art has erred seriously, it is in claiming for his use of light and shade and air a ground in realism. As a matter of fact, it would be hard to imagine a more abstract means of expression.

Critics seek rather idly the basis of his golden shadows in the half-light of his home. What such an interior was like we know very accurately from the picture of De Hoogh; but Rembrandt deals in light and shade that never were except in his own imagination. He pays the slightest attention to times of day and to all problems in specific lighting, choosing merely the illumination that best conveys his mood. Thus he has little to do with the modern luminists. His irradiated shadow is a glamour that his brooding spirit imposes upon the world. For this reason he is an unsafe model, as was shown by the artistic shipwreck of most of his scholars and imitators. He invented his half light only that he might people that golden "darkness visible" with types of human tenderness and pathos.

No one so well as he has realized the universal humanity of the Bible narrative—its direct appeal to the heart. How understandingly he has stripped these scenes of all hieratic associations, of all merely learned or traditional sophistifications! "Christ Before the Doctors," "The Raising of Lazarus," "Abraham and Isaac," "The Flight into Egypt"—these are representative of the subjects he has treated in all simplicity. As no other artist, he has grasped the beauty of the homely Protestant conception of the Bible. Rembrandt some way managed to walk with God's folk of old in humble and friendly fashion. They were his neighbors and real visitants, and with them he used a frankness in striking contrast to the caprice that made him travesty himself and his bodily sitters in all manner of studio trappings. In short, when we speak of realism in Rembrandt, we mean simply his sincerity of emotion—his peculiar meditative pathos. His portraits, for example, as compared with those of Titian, of Hals, or better, of Velasquez, are highly unreal and conventional, but it is a convention that expresses admirably the penetrative insight and broad sympathy of the painter-poet of Amsterdam. The realist sets a person in a canvas; Rembrandt fills a canvas with a personality.

No school and no nation may fairly claim Rembrandt. He deliberately forewent the sober excellence of color and solidity of design that make the Dutch school great. With small pride as an inventor of methods, he elaborated a procedure that no one has imitated with safety. Unriddling the mystery of light and shade, he forbore to complete his discovery, utilizing it only so far as it served his limited pictorial message; with a remarkable sense of the value of color, he used it only as a casual grace to enliven his monochrome. At every point one perceives the sacrifice of artistic breadth to profundity. Rembrandt is the most solitary figure in art, for, apparently, no sense of superiority

or pride of artistry sustained him; yet this isolated figure brings to human emotions the just and all-embracing sympathy of a little child.

The sun shines upon the just and unjust, and so the illuminated dusk of Rembrandt embraces without discrimination the beautiful and the unbeautiful. It is, in fact, the beauty of the picture, and the form is largely incidental—a mere centre of coruscation. Nothing more clearly marks him off from the classical tradition than his refusal to impute a beauty that does not lie in the subject. By what seems a kind of good luck, he has painted a few pictures of a peculiarly living and tremulous grace. One recalls the little Susannah of the Louvre, or, better, the "Finding of Moses," now in the collection of J. G. Johnson of Philadelphia—a picture that, with greater seriousness, has the romantic elegance of a Watteau. Such rare examples show that Rembrandt was great, not merely in his achievements, but in his renunciations.

REMBRANDT EXHIBITION AT WASHINGTON.

WASHINGTON, July 16.

A Rembrandt exhibition opened in the Congressional Library yesterday, in commemoration of the tercentenary of the birth of the artist. Through the efforts of Arthur Jeffrey Parsons, chief of the Division of Prints in the library, and also a trustee of the Corcoran Gallery, a representative collection of Rembrandt prints has been gathered and will remain on exhibition in the Hall of Arts throughout this year. There are 550 prints in all. They come from various sources: from the T. Harrison Garrett collection of Baltimore, which, in its entirety of 20,000 prints, has been deposited in the Library of Congress as a loan; the Gardner G. Hubbard collection of Washington, a gift to the library; the George Lathrop Bradley collection of Washington, a loan to the library; and from the general collection owned by the library, obtained largely through the purchase of the George P. Marsh collection. It is interesting to note that the T. Harrison Garrett collection owes its existence to-day to the fact that it was deposited in the library. The Sunday after the prints had been shipped here, the great Baltimore fire destroyed the building in which this collection had been stored.

The hall is well lighted, and admirably suited to an exhibition of this kind. Three hundred and one of the prints are etchings, 154 are reproductions of paintings, and 95 are drawings and sketches. When it is recalled that the greatest number of Rembrandt plates which have been admitted by any critic is 375, the number admitted by Rovenski in 1890, and the smallest number 329, which was declared by Middleton, in 1878, to include all of the Rembrandt plates so far as he had been able to identify them, the representative character of this exhibit will be appreciated. Only a few copies are included among the etchings,

and these for the purpose of completing the several states of the plates.

In arranging this exhibit Mr. Parsons has followed Rovenski's classification, which begins with Rembrandt's portraits of himself. These are exhibited in a glass case to the left as one enters the hall. Passing from these portraits, which some will think the most interesting group of all, the visitor finds, in the following order, that used by Rovenski, the works of Rembrandt according to subjects: (2) Old Testament, (3) New Testament, (4) saints, (5) allegorical, historical, etc., (6) beggars or mendicants, (7) figures, (8) landscape, (9) portraits of men, (10) heads of men, (11) portraits of women, (12) head studies. Groups two and three, pictures inspired by the Old and New Testaments, are among the largest in the collection. Midway in the Hall of Arts is a case containing that foremost of all his etchings, "Christ Healing the Sick," called the "Hundred Guilder Print." Of this etching there are prints of its several states. Nearby is the Abraham series of etchings: "Abraham sending away Hagar and Ishmael," "Abraham and his son Isaac," and the "Sacrifice of Abraham." Other famous etchings in this group of religious subjects are: "Christ Presented to the People," "Descent from the Cross," "Repose in Egypt," "Jesus Christ Preaching," "Ecce Homo," "Raising Lazarus," "Flight into Egypt," and the "Three Crosses." Rembrandt's portraits of men and of women, and his studies in heads complete the collection of etchings; and the groups are represented by many of the best etchings of each, as, for example, the portraits of "Renier Ansloo," "Jean Lutma," and the little and great Copenois. The portraits of women include that entitled "Old Woman Sleeping," and several of Rembrandt's etchings of his mother.

A representative collection of engravings of Rembrandt's paintings occupies nearly a third of the space. Each card in this section gives the title of the painting, the collection in which it originally appeared, place of collection, date of painting, and reference to the Bode catalogue. Of the 154 paintings of which prints are here exhibited, 43 are not described in the catalogue of Bode. Here may be seen examples of nearly all of the engravers of Rembrandt's paintings, Dutch, German, English, French and American.

Of the two hundred and fifty paintings by Rembrandt now in existence, the cards prepared under the direction of Mr. Parsons tell us that some thirty are in art galleries and private collections in this country. The most notable Rembrandt collection in this country is probably that of Henry O. Havemeyer of New York, which includes "Portrait of a Gentleman," long known as "The Treasurer"; "Portrait of a Lady of the Van Berestejn-Vucht Family"; "Portrait of a Gentleman" of the same family; "Portrait of the Gilder"; "Portrait of an Old Lady, looking to the left, her hands clasped"; "A Young Woman, resting her right hand with a fan on the back of a chair"; and a "Portrait of a Young Man in a high hat, his left hand on his breast." Other Rembrandts in New York, and the collections in which they appear, are: Metropolitan Museum, "A Pale Young Man, with long hair and a broad-brimmed hat, his left hand in his

coat"; and "A Man in a broad-brimmed hat, with a dark beard"; T. J. Blakeslee, "The Sibyl"; James W. Ellsworth, "Portrait of a Man of Forty"; F. E. Fischof, "An Old Man with his throat uncovered"; George J. Gould, "A Study of an Old Man with a beard, in a red cap," and "The Standard Bearer with a red sash"; Robert Hoe, "A Young Girl"; collection of the late Joseph Jefferson, "Portrait of Petronella Buys"; Morris K. Jesup, "Portrait of a Young Man" and "Portrait of a Young Woman"; H. McK. Twombly, "The Noble Slav"; Richard Mortimer, "A Warrior putting on his armor"; Charles Stewart Smith, "St. John the Baptist"; H. L. Terrell, "Rembrandt with short hair in a feather cap"; Charles T. Yerkes's collection, "The Raising of Lazarus," "Portrait of an Officer," "A Rabbi in a White Cap," and "Jupiter and Mercury entertained by Philemon and Baucis."

BUILDING UP THE CANADIAN ARCHIVES.

OTTAWA, July 14.

In an unostentatious way, befitting the character of the work and the scholarly men who are engaged in it, the Canadian Archives are being developed into one of the most complete and, what is much more important, most accessible collections of historical manuscripts in America.

The history of the Canadian Archives does not go back many years. The first Dominion archivist, the late Dr. Douglas Brymner, was appointed in 1872, at the instance of a number of Canadians interested in historical research. Dr. Brymner took hold with enthusiasm of the work of gathering the scattered records of Canadian history, but the importance of his task and of the results was not appreciated by the political leaders of the day. He was consequently hampered by the meagreness of the appropriations annually voted by Parliament. The marvel is that, under such discouraging conditions, he accomplished so much. Francis Parkman, Dr. Coues, Dr. Kingsford, Justin Winsor, and other historians and students have borne witness to the value of the Canadian Archives and the industry of the late archivist.

Dr. Brymner devoted all his energies to gathering material. He was always haunted by the knowledge that historical documents, many of them indispensable to full knowledge of the facts of early Canadian and American history, were disappearing. This applied not merely to manuscripts in the hands of individuals, but even to those in the possession of foreign Governments. Dr. Richard, author of "Acadia," who was for some time assistant archivist, prepared ten years ago a calendar of manuscripts found by him in the various departments of the French Government, which he thought should be copied for the Canadian Archives. Owing to continued lack of funds, Dr. Brymner had to put off from year to year the copying of these documents; and when at last the work was taken in hand, it was found that, even within the decade, many important documents had disappeared. In one case the head of a department had cleaned out hundreds of valuable records, many of them bearing on the early history of this con-

tinent, to make room for his secretary; and the manuscripts were sold as waste paper.

With the knowledge before him of this steady wasting away of original documents, Dr. Brymner devoted all his time and energy to hunting up material, and securing for the archives either the originals or accurate copies. He possessed in an eminent degree that nose for the whereabouts of original documents so useful in an archivist; and he was constantly engaged in tracing clues and running down manuscripts in the most unlikely places. He had neither the time nor the assistance, nor perhaps even the inclination, for making the rapidly accumulating volumes of manuscript material readily accessible by means of indexes and other bibliographical appliances. While he lived, this lack was not seriously felt; for Dr. Brymner's knowledge was so minute and his memory so exact, that he could instantly find any document, and could generally refer to everything else he had on the same subject.

After the death of Dr. Brymner, chaos reigned for a time, until the Government in appointing Dr. Arthur Doughty of Quebec as his successor brought to the office one who combined Dr. Brymner's scholarship and talent for hunting down material, with organizing ability and a perception of the advantages of modern methods in cataloguing and indexing.

Under Dr. Doughty's hand, the Canadian Archives are rapidly taking a place beside the Archives of other lands. Through the sympathetic interest of the present Viceroy of India, Lord Minto, who at the time of Dr. Doughty's appointment was Governor-General of Canada, and of the Prime Minister, Sir Wilfrid Laurier, the Government was induced to provide adequate accommodation for the Archives. A suitable appropriation appeared in the estimates two years ago, and the Archives building is now nearing completion. It has been made as nearly fire-proof as possible. The book-cases, shelving, doors, and window-frames are of steel. It is even proposed to have tables and chairs of the same material. When the Archives have been moved into their new quarters, they will be as safe as human ingenuity can make them.

Steps have been taken to remove to the new building, not only the present collections of the Archives Branch, but also all the historical material now scattered through various departments of the Government. Some years ago a Royal Commission examined the records of all departments, and strongly recommended that everything of permanent value should be removed to the Archives. The Commission found valuable material the existence of which was unknown even to the officials of the departments concerned. From the Department of Militia and Defence is to be taken an immense mass of documents bearing on the Indian wars, the War of the Revolution, the War of 1812, the Fenian Raids, and the Red River Rebellions. From the Department of State comes the entire Branch of Public Records, including a vast accumulation of official and other documents bearing on the political history of Canada, back to the French Régime. From the Governor-General's Office, have already been taken several hundred vol-

umes of original dispatches of the Governors of Canada to the Colonial Office at London. Other equally precious matter will come from the Privy Council Office, the Library of Parliament, the Department of Justice, the Interior Department, and the Department of Indian Affairs.

Probably before the close of the present year, all this material, with the collections of the Archives, will be in the new building; and before the close of the following year the whole will be roughly classified and shelved. But this is merely preliminary. The Archivist will provide an adequate key to the documents in the form of a card index. The work is already well advanced on the original Archives, but the indexing staff will be busy for many years preparing the five or six million cards required for material already in sight, without counting future accessions. When the work is brought up to date, the Canadian Archives will be one of the most valuable, because most accessible, collections in the world. The new archivist has also made a beginning with a Bibliography of Canadian History, designed on a scale far in advance of anything now available. This will also be on cards, but when reasonably complete it will be published in one or more large volumes, to be followed at intervals by supplements.

Another undertaking is the preparation of a guide to historical manuscript material throughout Canada. Specialists are already engaged on this work in the various provinces, and from the notes so far received at Ottawa it is clear that the guide will be of great service. Manuscript material is scattered everywhere throughout the Dominion, in the Archives of the provincial Governments, in college and society libraries, and in the hands of individuals. The manuscripts in the libraries of Laval University, Quebec, and St. Mary's (Jesuit) College, Montreal, are so extensive that the librarians themselves have as yet only an approximate knowledge of their number and character. The old seigniorial families of the province of Quebec, and the old Acadian families in Nova Scotia, possess documents a knowledge of which might upset many conclusions of the historians. The recent organization of an Archives Department at Toronto, under the Provincial Government, has stimulated the interest in original documents in Ontario, and has relieved the Dominion Archives of much research so far as that province is concerned. By a system of coöperation the Provincial and Dominion archivists will each get the benefit of the other's labors. In connection with the guide to historical manuscript material, members of the Dominion Archives' staff are visiting the older churches of the country and the notarial offices in Quebec, and making exhaustive notes as to the scope of all the parish registers. More than one apparently hopeless tangle in early Canadian history has been straightened out, because some parish register showed that such a man appeared as godfather on a certain date, as witness on another, and so forth. The guide to historical manuscript material, like the bibliography of Canadian history, is eventually to be published by the Government in book form.

Meanwhile, the work of gathering material has not been lost sight of. One of Dr. Doughty's assistants is permanently sta-

tioned in London, and is engaged in systematic examination of records in Great Britain, France, and the other countries of Europe. A copyist is transcribing documents at Hudson's Bay House, in London, and material already sent over indicates that it may be necessary to rewrite much of the early history of Western Canada. Recently it has become known that many documents belonging to or bearing on the North West Fur Company of Canada are in one of the Government departments at St. Petersburg. How they got there Heaven only knows. Copies are to be made and sent to Ottawa. One of the most important of recent finds is the discovery in Paris of what seems to be conclusive proof of the authenticity of the discredited fourth voyage of Jacques Cartier; also a very early plan of Quebec.

This year's Archives report will not, as hitherto, be confined to one modest volume, but will fill three large volumes. Documents will be printed freely *in extenso*, including material on the constitutional history of Canada, as well as of hitherto unpublished, and indeed unknown, matter touching the Acadians. The report will also contain reproductions of several rare historical plates.

Correspondence.

RAILWAY CASUALTIES.

TO THE EDITOR OF THE NATION:

SIR: From your remarks upon the lamentable railway accident at Salisbury, England, in your issue of July 5, it would seem that you regard the loss of life to passengers on English railways as rather greater, proportionately, than it is on railways in the United States; and you arrive at this conclusion by distributing the casualties over the railway mileage in each country, with the unquestionable result that in the United States ten times the number of stationary, horizontally laid rails appear to have been the death of only four or five times the number of passengers killed in England. But what has railway mileage to do with it? On the same principle it would be easy to prove the exceptional safety of any ill-built, ill-managed pioneer railway, with one passenger train a day each way and a smash-up once a month, as compared to an equal number of miles of the New York Central, in the immediate neighborhood of New York, with about a thousand times as much usage. Surely, the basis of a comparison of railway casualties ought to be the amount of traffic, not length of line. Passenger traffic on English railways is enormous, as compared with that in the United States, although the average distance over which each passenger is carried is probably not so great. Moreover, the density of the traffic, and therefore the risk of collisions, is much greater in England. I have not attempted to work out such a comparison for myself, but I find one already made in Hazell's Annual for 1906, which I beg to append. The statistics are for the year 1904:

	England.	U. S.
Passengers killed	115	411
Passengers injured	2,669	9,111
PROPORTION OF PASSENGERS KILLED AND INJURED TO PASSENGERS CARRIED.		
	England.	United States.
Killed	1 in 199,753,000	1 in 1,622,267
Injured	1 in 2,244,472	1 in 78,523

The figures for the accidents to railway employees are even more impressive:

PROPORTION OF SERVANTS KILLED AND INJURED TO SERVANTS EMPLOYED.

	England.	United States.
Killed	1 in 10,144	1 in 357
Injured	1 in 747	1 in 19

H. H. LANGTON.

Toronto, July 10.

[These figures do not tell the whole story, inasmuch as they take no account of the average distance travelled by each passenger. The length of the trip is greater in the United States. Much of English railway travel is the London suburban traffic.—Ed. NATION.]

Notes.

The next volume to appear in the Highways and Byways series (Macmillan) will be that on "Dorset," by Sir Frederick Treves. The volume will be illustrated by Joseph Pennell.

Prof. Charlton M. Lewis of Yale will soon publish through Henry Holt & Co. "Principles of English Verse." Professor Lewis writes, he says, "chiefly for the general reader."

The Rev. Bridgeman Boughton-Leigh's "Memorials of a Warwickshire Family" will be published this month by Henry Frowde. Sir H. Gilzean-Reid contributes a prefatory note.

Under the title of "An Englishwoman in the Philippines," E. P. Dutton & Co. will publish shortly a book by Mrs. Campbell Dauncey. It is in the form of letters home, and it gives a view of life in the Philippines generally, and in Manila and Iloilo. Dutton also promises at an early date "Sidney Herbert: Lord Herbert of Lea," a memoir by Lord Stanmore, 2 vols.; "Personal Forces in Modern Literature," by Arthur Rickett; "From a Cornish Window," by "Q."; "Side Lights on the Home Rule Movement," by Sir Robert Anderson; "George Crabbe and His Times," by René Huchon; "A Week in Waterloo in June, 1815," by Lady De Lancey; "The House of Cobwebs," by George Gissing, and "The Quest of the Simple Life," by W. J. Dawson.

Geronimo, the Apache outlaw and chief, has spent the last two years in writing his autobiography, which is to be published by Duffield & Co. S. M. Barrett, superintendent of schools at Lawton, Okla., has been the medium through which the chief, now seventy-seven years of age, has told the story of his life and of his people.

Doubleday, Page & Co. believe in distributing their books through the year. They will soon have ready for publication "The Frog Book," an "authoritative" work on that subject by Mary C. Dickerson; "How to Make a Fruit Garden" and "Cotton," a "complete" book by Charles W. Burkett and Clarence H. Poe. A work of historical importance is "Recollections and Letters of George Washington," which gives a picture of the home life at Mt. Vernon and contains a number of unpublished letters from Washington to his confidential secretary, Tobias Lear.

Norman Duncan has just finished a sea-yarn for boys, "The Adventures of Billy

Topsail," which will be published by the Revell Company this autumn. The same firm announces "The Undertow," by Robert E. Knowles; "On the Trail of the Immigrant," by Edward A. Steiner, and "The Doctor," by Charles W. Gordon, better known as "Ralph Connor."

Messrs. G. P. Putnam's Sons will begin in October the publication of *Putnam's Monthly*, a reissue of the magazine first published by the late George P. Putnam in 1853. With the new Putnam's will be incorporated the *Critic*, which has been issued by Putnam since 1898.

"Books and My Food" (Moffat, Yard & Co., \$1 net) is a little volume of appropriate quotations and recipes for every day in the year, prepared by Elizabeth Luther Cary and Annie M. Jones. The quotations will be a godsend to the harassed makers of menus for public occasions, and the recipes look appetizing; but why should they be distributed singly under the days of the year?

"Spain and Her People" is the title of an illustrated book by Mr. J. Zimmerman, which T. Fisher Unwin has just issued in London. It opens with sketches of the sights of Spain—the Alhambra, Grenada, etc. Then follow chapters on Spanish Life and character, the Inquisition, the expulsion of the Jews, and the Moors. The final chapters deal with the causes of Spain's decline, and her future prospects.

"The Building of the Organ" and "Onward," two "symphonic poems," published two years ago, by the author, Nathan Haskell Dole, are now issued with the imprint of Moffat, Yard & Co.

The series of translations published by the Oxford University Press includes "Longinus on the Sublime," a work which has stood next to Aristotle's "Poetics" as the source of modern criticism, "a golden book," as old Isaac Casaubon called it. The depth, or, as one may say, centrality of its views may be understood from the fact that so classical a critic as Sir Joshua Reynolds had it constantly in mind while writing his "Discourses," and that so one-sided, if protesting, a romanticist as Professor Saintsbury accepts it as one of the bibles of criticism. The translation by A. O. Prickard is smoothly done. The Introduction gives the data which underlie the discussion of authorship and date, without attempting any dogmatic solution of that question, and the notes supply the information demanded by the non-classical reader. The little book is highly commendable.

A translation of Longinus was published in 1712 by Leonard Welsted, a versifier and critic whom Pope savagely attacked in the "Dunciad":

Flow, Welsted, flow! like thine inspirer, beer;
Tho' stale, not ripe; tho' thin, yet never clear.

These lines were a return for some of Welsted's strictures upon Pope. Welsted, possibly inspired by Longinus, seems to have been at odds with the school of Pope. Writing in 1724 he declared roundly that "a great part" of the contemporary English poets "have been imitators; another body of men, yet more numerous and more despicable than these, consists of such as have learnt from the rules the measure of a verse, and a few other things of not much more consequence; and cer-

tainly of all the causes that have helped to swell the throng of ill writers, none have more contributed to it than those essays on poetry before mentioned." This last clause is a direct slap at Pope's "Essay on Criticism." Further on Welsted talks of "mechanical poets." In fact, Welsted, however faulty his practice, professed some of the doctrines which later inspired the romantic movement.

It would not be easy to name a writer of English better fitted to reproduce the style of Anatole France than the late Lafcadio Hearn. How many readers of Hearn know that he made a translation of "The Crime of Sylvestre Bonnard" for Harper & Bros. as late as 1890? The volume is now reissued. Harpers also reprint James de Mille's "Cord and Creese." This novel by the author of the once famous "Dodge Club" was first published in 1869.

Funk & Wagnalls publish Taine's "Balzac, a Critical Study" (\$1 net) in a translation by Lorenzo O'Rourke. A fresh impulse, no doubt, will be given to the criticism of Balzac by the work on that novelist by Mr. Brunetière which will soon be added to Lippincott's French Men of Letters, and this English version of Taine's appreciation is thus well-timed.

"The Scottish School of Painting" can hardly be said to have convinced the world of its separate existence, but in his book of that title in "The Library of Art" (Duckworth-Scribner, \$2 net) William D. McKay has succeeded in demonstrating that painting in Scotland, or in England by Scotchmen, has had, since the day of Raeburn and Wilkie, certain national characteristics which fairly entitle it to the name. None of the members of the school have equalled in eminence the founders of it, but it is impressive to find how many of the leading painters of Britain have come from the northern end of the island. The author is a "professional painter" who writes with knowledge and confidence of technical matters, and the volume is fairly illustrated.

We may mention here two useful books published by Wiley & Sons on a subject attracting continually more attention in this country. In his "Garbage Crematories in America" William Mayo Venable gives the design of every type of crematory built in the United States. And there is a large amount of discussion of matters connected with garbage or refuse disposal which should be of value to those interested in this work. "The Disposal of Municipal Refuse," by H de B. Parsons, is the result of observations while engaged in making designs for the disposition of some of the New York city refuse. The book is mainly devoted to the characteristics of the material collected in New York, the uses to which it may be put, and the principles underlying its sanitary and economic handling.

Professor Jastrow has chosen an interesting subject for his essay in descriptive psychology in "The Sub-conscious" (Houghton, Mifflin & Co., \$2.50 net), and it seems almost impossible to render dull even a second-hand narrative, e. g., of the extraordinary adventures of "the Rev. Mr. Hanna," "Mlle. Hélène Smith," or the three "Miss Beauchamps." He treats it, moreover, as befits a competent psycho-

logist, by emphasizing the relations and tracing the connections between the normal and the abnormal, the conscious and the sub-conscious, functions of our complex personality. The book, nevertheless, can hardly be accorded unreserved commendation. It is far too diffuse, and consequently far too long (over 500 pp.). It is written, moreover, in a highly metaphorical language which is better calculated to obscure Professor Jastrow's meaning than to render it popular, as was doubtless his intention. It is also far too full of usages which, like "novitiate" for "novice" (p. 255), are at best very doubtful or rather downright blunders. And on the theoretic side also the work is not remarkable for any great lucidity, strength, and insight. He could have improved it considerably if he had defined the vague terms he has to use, and inquired how the "normal" differs from the "usual," how "waking" life is differentiated from a "dream" and what are the motives and methods for discriminating between "real" and "illusory" experiences. If he had done this, he could have made clearer the very ambiguous notion of the "abnormal" which at present covers both that which departs from the standard of efficient functioning and that which over-passes the usual. It would also have added to the interest and value of the book if he had explained in detail the grounds for his dissent from the theories embodied in Myers's great work on "Human Personality."

An interesting work is the biography of the well-known German poet and scholar, Hermann Kurz, written by his daughter, Isolde Kurz, one of the most popular of living German authors, especially in the domain of fiction. The biography, just published by Georg Müller in Munich, is particularly valuable for the description of his private life and the severe material difficulties with which he had to contend even in the pursuit of an ultimately successful literary career.

It is commonly supposed that the English books republished by American houses some thirty or forty years ago were usually pirated. This was, in fact, too often the case, but the more honorable firms paid well for the property they took. Harpers, for instance, paid Dickens £1,000 for "A Tale of Two Cities," £1,250 for "Great Expectations," £1,000 for "Our Mutual Friend," £250 for "Little Dorrit," £360 for "Bleak House." To Thackeray they paid £150 for "The Newcomes," £100 for "Henry Esmond," £480 for "The Virginians," and £200 for the unfinished "Denis Duval." Some of the payments to Anthony Trollope are interesting. Thus, £25 went for "The Bertrams," £50 for "Castle Richmond," £50 for "Rachel Ray," £100 for "Phincas Finn," £50 for "Phineas Redux," £200 for "The Way We Live Now," £175 for "The Prime Minister," £100 for "The Life of Cicero," £200 each for "The Eustace Diamonds," "Orley Farm," "Lady Anna," and "Ralph, the Heir"; £250 for "The Golden Lion of Granpre," about £700 for "Sir Henry Hotspur," "Adam Bede" was published anonymously, and £20 was paid as an honorarium; for "Silas Marner," £100 was paid, and for "The Mill on the Floss" and "Felix Holt" the author received £300 each. The amount paid for "Middlemarch" was £1,200, and for "Daniel

Deronda" £1,700. The payments for Wilkie Collins's stories were large: £500 for "No Name," £360 for "The Woman in White"; "Man and Wife" and "The Moonstone," £750 each; "Poor Miss Finch," £600; "Law and the Lady," £500; "The New Magdalen," £588. Charles Reade's stories brought the author considerable sums: £200 for "Love Me Little," £500 for "Put Yourself in His Place," £200 for "Hard Cash," and nearly £1,000 for "A Woman Hater."

The recent sale in London of pre-Shaksperiau plays proved very successful. The total price realized for the seventeen lots was £2,602, or about \$13,000. Among the more important individual prices were: "Trial of Treasure," 1567—£160; "A Right Pithy, Pleasaunt and Merie Comedie Intytuled gammer Gurttons Needle," 1575, the very rare first edition of this the second English comedy—£180; George Wapull, "The Tyde Taryeth no Man," 1576, the rare and only edition—£176; "A Preaty Enterlude called Nice Wanton," 1560—£169; "An Enterlude of Welth and Helth," probably unique—£195; Thomas Preston, "A Lamcutable Tragedie, containing the Life of Cambises, King of Percia, (?) 1570, probably the first of the two editions printed without a date—£169; Thomas Ingelend, "The Desobedient Child," circa 1565—£233; "Thenterlude of Youth," printed by John Waley, no date, but probably 1557—£230; "A New Enterlude . . . entituled New Custome," printed by William How, no date—£155; and "A Newe Interlude of Impacyente Poverté," 1560—£150. It is understood several of these plays will find their way to the British Museum.

The Society of Authors of England now has £2,643 invested in funds, the income to be used for pensions. Within the year it has received a legacy of £50.

For some time past the financial troubles of Cambridge University, due largely to the shrinkage in value of rural real estate, have been growing more acute. Both Oxford and Cambridge have suffered from the popular delusion that they are rolling in wealth. The Cambridge University Library and several of the scientific schools have been badly crippled for years by the lack of funds. A few months ago an effort was begun to raise £150,000 for the perpetual endowment of the library, but of this amount less than £18,000 has been promised, and the prospect is not bright. Now the vice-chancellor, the librarian, and other authorities have issued an urgent appeal to old university men and others, for help in their time of need. Although the Cambridge Library is not so famous as the Bodleian, and far less imposing in its architecture, it is nevertheless one of the largest in the United Kingdom, contains nearly half a million volumes, and many priceless MSS. It certainly ought to be endowed with an income in some degree commensurate with its importance. As matters now stand it is impossible to increase or even maintain its efficiency, a condition which falls little short of a national humiliation.

In the twenty-one German universities the number of matriculated students during the present semester is 44,964, of whom 211 are women; there are also 2,381 male and 1,274 female hearers, making in all 48,-

619. In the last semester there were 42,390, and in the summer semester of 1905, 41,928 students, showing an increase respectively of 2,574 and 3,036. Berlin has the largest number of students, namely, 6,569; then come Munich, 5,734; Leipzig, 4,147; Bonn, 3,275; Freiburg, 2,350; Halle, 2,128; Göttingen, 1,925; Heidelberg, 1,922; Breslau, 1,920; Marburg, 1,717; Tübingen, 1,710; Münster, 1,454; Strassburg, 1,418; Jena, 1,362; Würzburg, 1,360; Kiel, 1,157; Giessen, 1,118; Königsberg, 1,080; Erlangen, 1,067; Griefswald, 890; Rostock, 661. The statistical records of the last thirty years show that the increase in the number of university students has been far more rapid than that of the population. In 1876 there were 16,799 university students; in 1886, 27,721; in 1896, 29,280, and in 1906, as already stated, there are 48,619. These figures prove that during this period of one generation the increase of students has been nearly three-fold and that of the population less than one-half.

Among the methods adopted in England to increase the interest in and knowledge of India is the presentation by the Royal Asiatic Society of a medal for the best essay on some Indian topic by a public school boy. This year it fell to a member of the sixth form at Rugby, whose subject was Hyder Ali. In presenting the medal John Morley, secretary of state for India, said that he did not think it quite accidental that the prize this year had fallen to Rugby, because he could not forget that of all the public schools Rugby was the first, under the admirable inspiration of Dr. Arnold, which taught history in the spirit in which it was pursued to-day. After commending the intelligence, promise of historical grasp, and aptitude in searching for historical parallels which the essay exhibited, he said that there was nothing more important in his opinion than the recognition of the extraordinarily perplexing problem in India. The only way to a solution was in acquiring a real knowledge of the thoughts, beliefs, social usages, conditions, and history of the Indian peoples. In the course of his speech he recalled an incident of his own schoolboy days at Cheltenham. History was taught then, but he did not remember that they ever wrote prize essays on history. He never did. But he did write what he wished should be a prize poem; it was not successful. However, the headmaster said: "I am glad you have composed this poem, because it shows all the elements of a sound prose style."

The successful ascent on June 18, as announced in a telegram to the King of Italy, dated from Uganda, of the lofty Ruwenzori by Prince Luigi, Duke of the Abruzzi, is another remarkable illustration of the value of preparation and of what might be termed boundless resource in the prosecution of certain forms of geographical research. It is true that not many efforts had heretofore been made on the great ice mountain of Central Africa, and the failures reported were in no wise discreditable to Alpinism; but what is apparent in the latest attempt, and that which stands out with marked significance, is the dispatch with which the work was accomplished. The journey thither and the ascent of the mountain took only a few weeks. The same dispatch marked the Duke's brilliant ascent of Mount St. Elias, Alas-

ka, in 1897; and the same direct, business-like method was applied two and three years later to the attack upon the Polar regions, when Capt. Cagni attained the "farthest north" in latitude 86 degrees 33 minutes north, surpassing by thirty miles Nansen's hard-fought effort with what by comparison seemed to be scarcely more than child's play. The lesson of the value of Alpinistic methods and of a sufficiency of good Alpine guides as they are recognized in Italy and Switzerland could not be more impressively taught.

—The second volume of Harry Alonzo Cushing's "Writings of Samuel Adams" (Putnams) covers the years 1770 to 1773. What strikes the reader is the large space devoted to newspaper writings attributed to Adams. The volume contains ninety-two pieces in all; of these forty-one are newspaper articles, twenty are reports or memorials prepared in committee, and thirty-one are private letters. The reports or memorials were presented by committees, of which Adams was a member, and it is to be presumed that they passed through more than one hand before taking the form in which they are now printed. Thus the language may be Adams's, though the matter was supplied by others. Mr. Cushing offers few intimations of the reasons for giving the authorship of these writings to Adams. Wells was notoriously partial to his subject, and took credit for Adams upon the flimsiest pretext. The mere presence of Adams upon a committee led to the assumption that he wrote the report; the employment of a signature in the newspaper, upon one occasion, was accepted as proof that all articles so signed came from his pen. Bancroft attributed the "Chatterer" and other series to Adams. Mr. Cushing mentions in confirmation some "apparently contemporaneous annotations" found in a file of the *Gazette*, once owned by Dorr; but he does not state what these annotations are, whether a direct attribution of authorship or a surmise on the part of the annotator. The first form of one of the "Vindex" series is in the Adams manuscripts in the Lenox Library, which induced Mr. Cushing to include thirteen "Vindex" pieces in this volume. In like manner a draft of a "Candidus," found in the same place, gives opportunity to reprint nineteen articles so signed. Hutchinson is hardly a safe witness where his dislikes were involved, and his belief that Adams was the author of two letters to Franklin and a State paper cannot be accepted as final in default of better evidence. In a few instances a note (and the notes of the editor are, as a rule, excellent) directs attention to other claimants to the authorship of these papers, but even the presence of a copy of a State paper in the Adams MSS. cannot be conclusive, as copies were freely taken of important documents by those interested. It would appear, therefore, as if the material which may be accepted as unquestionably by Adams, forms a small part of this volume, and is to be found in the letters, nearly all of which have appeared in print in other places. Mr. Cushing has followed Wells too closely, and has not made such a careful, critical study of the contributions to journals as to give his decision the requisite weight.

—Mrs. Zelia Nuttall, whose work as an Americanist has done much to advance our

knowledge of the ethnic relations and conditions of life of the aborigines of middle America, contributes to the publications of the University of California an interesting paper on the "Earliest Historical Relations between Mexico and Japan." Much of the material contained in this paper has been obtained from still inedited documents pertaining to the conquest and organization of the Spanish possessions in the New World, which form part of the Madrid publications, while the remainder has been drawn from the historical notes of Ortega, published in the City of Mexico in 1879, and the very recent writings of Señor Lera, the Mexican Minister Plenipotentiary to Japan and China. The first steps toward the establishment by Japan of official relations with New Spain seem to have been initiated by the "illustrious" Tokugawa Iyeyasu as far back as 1598, by the same ruler, therefore, who subsequently framed for his country the theory and condition of exclusion and isolation. In a communication addressed a few years later to the governor of Luzon, Iyeyasu promises the abrogation of piracy in Japanese waters in compensation for support in establishing direct trade relations between his country and New Spain, which at that time appears to have been one of Iyeyasu's chief desires. Within less than a quarter of a century from this time Iyemitsu issued his edict interdicting Christianity in Japan and ordering away all foreigners. Mrs. Nuttall finds that in 1610 twenty-three Japanese noblemen and merchants, forming part of an official or semi-official embassy, passed several months in the capital of New Spain, and that in 1613 this number had been increased to nearly two hundred. The indications of Asiatic influence in New Spain which have from time to time engaged the attention of ethnologists, are thought to be properly referable to this early Japanese influx. Mrs. Nuttall also attributes to the Japanese the introduction of the grass or palm-leaf raincoat, which is to-day worn by the Indians of the Pacific Coast of Mexico, and which is thought to be identical with the similar garment "used in Japan from time immemorial." But it should be remembered that a largely identical garment is common with the peasantry of southern Hungary and Rumania.

—After an interval of twenty years we are glad to see a second edition of John Chipman Gray's "The Rule against Perpetuities" (Boston: Little, Brown & Co.). A very modest preface states that about a hundred pages have been added to the text, and fifty to the appendix. The subject is too technical for the apprehension of the laity in general, yet there is no branch of legal learning less obnoxious to the reproach of irrationality or inconsistency. The author, who may fairly be said to be our modern master of it, likens the solution of its problems to those of questions in mathematics, which must, in the light of the axioms and corollaries proper to the Rule, be either right or wrong. The decisions under it are not among those which "might as well have been decided the other way." Leaving out questions of construction—for the question of what the Rule means is one of hermeneutics rather than of law—the discussion of the true application of the Rule against Remoteness (the alternative designation suggested by the

author) is a matter of severe logic and pure ratiocination. In the legislature-burdened community in which we New Yorkers live, the Rule does not exist, having been replaced two generations since by the statute making it necessary that future interests shall vest within "two lives." This statute, like the Statute of Frauds may be said to have produced far more trouble than its non-enactment could ever have possibly caused. Before the passage of the Revised Statutes—when the ordinary Rule was in force—there had been but one case relating to it. From the passage of the Revised Statutes down to 1886, when the first edition of this treatise was published, there had been one hundred and seventy cases; in the period since 1886 there have been some one hundred and sixty-six cases more. Such are the fruits of ill-considered law reform.

—A short time ago Drs. W. Amelung and H. Holtzinger contributed to the series called "Modern Cicerone" a volume in which the former described *Die Antiken-Sammlungen*, and the latter *Die Ruinen Roms*. This work has now been issued in an English translation, in two volumes, under the title "The Museums and Ruins of Rome" (Dutton), and Amelung has added three new chapters (on the Museo Barracco and the collections in the Villa Borghese and the Villa Papa Giulio), besides recasting many of his former descriptions and constructing a useful chronological index. The private collections of the city are not included in either description or index. Amelung is one of the very best living authorities on ancient sculpture, as all readers know who are familiar with his works on the antiques in Florence and on the Vatican sculptures; and this present volume will be an indispensable companion to students in the museums themselves, and for home study as well, resembling in this respect Helbig's well known guide. Amelung's knowledge and experience are broad and solid, his perception keen, and his writing vigorous yet pleasant. The translation represents him as worthily as perhaps any translation of a book of æsthetic as well as historic criticism could reproduce its original.

—Holtzinger's volume on the ruins is neither valueless nor unattractive, but is by no means of as commanding interest in its field as is its comrade. The author is evidently acquainted with recent work by both Italians and Germans, but writes as a student rather of architecture than of topography and history, and sometimes appears not to assimilate with ready discretion the conclusions of others. His book is not calculated to supersede a formal guide about the city of Rome, but might well accompany such a guide. The English translator, however, was apparently little acquainted with the subject, and not too well with the German language; and the supervision of the English reviser, Mrs. S. Arthur Strong, was apparently not extended over this volume. As a result, Holtzinger is made to say many wrong things of which a comparison with the German original shows that he is not guilty. See, for mere example (p. 1), "earth wall" for *Wallmauer* (p. 10), "slope of the Cacus" for *Aufgang des Cacus*, (p. 11) "next" for *zunächst*, "down to" for *noch in* (p. 14)

"in its old position" for *in der Anlage*, (p. 101) "water-citadel" (whatever that may be) for *Wasserkastell*, (p. 109) "paved floors" for *Fussbodenschmuck*, (p. 121) "one of the reliefs which contained his portrait" for *auf einem der Reliefs dessen Bildniss*. "Fourteen" (p. 12, of the shrines of the "Argæi"—sic) represents accurately the "14" of Holtzinger's text, but this was doubtless a misprint for 24. The very copious and excellent half-tone illustrations of the original are fairly reproduced in the translation, but have lost much of their primal brilliance.

The New Theatre Association of Chicago has organized a play competition. The piece selected will be produced in due season by the New Theatre Company. The conditions are (1) that the play must be an original drama, and not a translation, adaptation, or dramatization of any published work; (2) it must treat of modern American life, and be written by a citizen of the United States; (3) it must be substantially in a form for acting, and will be judged as an acting play; (4) it must be in three or four acts, without change of scene in any act, must not require over two and a half hours to play, and must not have over fifteen speaking characters. It must be submitted not later than December 1, 1906, to the New Theatre (Play Contest), No. 17 Van Buren Street, Chicago. Dramatists with rejected plays on hand will doubtless avail themselves of this invitation, but not much time has been allowed for new compositions. Nor are plays written in four months likely to be worth much.

The Chestnut Street Theatre, in Philadelphia, will have, after January 1, a stock company of its own, which will produce original plays, each of which will be presented for two weeks, by way of test. Six of these plays have already been selected. They are: "The Round-Up," by Edmund Day; "A Marriage of Reason," by Hartley Manners; "Goggles and Gasolene," adapted from the German; "The Energetic Mr. West," by Edgar Selwyn; a new farce by John J. McNally, and "Peaches," by George V. Hobart. After these plays have had their run, four original musical comedies and operas will be presented in succession. In this programme there is nothing to create much enthusiasm, so far as the plays themselves are concerned, but the establishment of a stock company upon something like sound old-fashioned principles is cause for congratulation. If the experiment is persisted in members of the company will enjoy in some measure the training and varied practice which is indispensable to the production of actors.

Comyns Carr's new play, "Tristram and Iseult," will be produced at the London Adelphi early in September. Oscar Asche will be King Mark and Miss Lily Brayton Iseult. To Matheson Lang has been assigned the character of Tristram, and there is some curiosity to see what this young actor, whose rise has been very rapid, will do with it. The cast will further include Miss Huton Briton as Arganthea, and Miss Gertrude Scott as Queen Oren, mother of Iseult. The play is in four acts. The first, on the coast of Cornwall, relates how Tristram was dispatched to Ireland by King Mark, ostensibly to be cured of his wound, but

really to meet his death for having slain Moraunt, son of King Gorman of Ireland. The second act takes place at the Irish court, outside of which the famous tournament is in progress. The third represents the deck of the ship on which Tristram has embarked, together with Iseult, and the fourth, divided into two scenes, reveals in the first instance a room in King Mark's castle, and in the second Iseult's bower in the forest.

Justin Huntly McCarthy has a rival. Edward St. John Brenon announces that he also has written a drama having Cæsar Borgia for its hero.

Bernard Shaw's play, "Cæsar and Cleopatra," in which Forbes Robertson is to be seen here in October, is in constant rehearsal in London under the direction of its author. Report says that, owing to certain difficulties revealed by rehearsal, it has been found advisable to cut out the third act altogether. Mr. Shaw generally arranges the construction of his play with a view to such contingencies. You could not cut an act out of one of Shakspeare's dramas without injuring it. In the case of Mr. Shaw's masterpieces, it is different. Herein may be found one of the many evidences of his superiority to the Swan of Avon.

London managers are reported to have come to the conclusion that the days of the variety shows offered to the public under the title of musical comedies are nearly ended. They think, in other words, that the patience of theatregoers has been exhausted at last by the impudent repetition of stale buffooneries under new names, and that some new form of entertainment must be devised to take its place. It is certain that nothing more worthless can be substituted, because the lowest depths of folly in this direction were sounded long ago. Any change, therefore, must necessarily be for the better. It does not follow, however, that it is likely to come at once, or even very soon. A single new success might alter the entire situation. But a good deal of money has been sunk lately in pieces of this description, and the promoters are growing tired of putting their hands into their pockets. Hoyt's compositions had a certain freshness and pertinency about them, although they were a pretty light foundation for the substantial fortune reared upon them, but there were no such redeeming features in the productions of his imitators, whose only aim seems to have been to excel each other in silliness, vulgarity, and extravagance. What must Shakspeare think—if his shade ever revisits the glimpses of our moon—of Seymour Hicks's proposal to make a "musical comedy" out of "As You Like it"?

A pretty severe dose of the most objectionable kind of modern French drama has been administered to Londoners lately, and some of the critics have summoned up courage enough to rebel against it, even at the risk of being sneered at by the devotees of the "advanced" drama for their methodistical and provincial turn of mind. Réjane has been playing "Le Rafale," in its entirety, and evidently with superb passion. She made a personal success, but clearly failed to convince all observers that the brilliancy of her acting was a sufficient justification of the object of it. She seems, however, to have extinguish-

ed all memory of Mrs. Patrick Campbell, who tried an expurgated version of the piece with indifferent success. Sardou's latest comedy, "La Piste," is less objectionable in character, and has the merit of being amusing, while "Le Rafale" certainly is not, but even this is marked by the old familiar taint, the old cynical assumption that impurity is the most natural and fitting subject of jest. The Sardou piece, however, is wholesome as new milk compared with "Le Passé" of George Porto Riche, in which Mlle. Brandès, the well-known actress of the Français, has been acting in London. As one London writer says: "It is really the worst kind, or almost the worst kind, of French yellow-back put upon the stage, and after seeing it one looks about for some sort of disinfectant for the soul."

Oscar Hammerstein has announced his intention of paying more attention to the spectacular ballet than it receives at the Metropolitan Opera House. Such ballets have enlisted the services of some of the great masters, especially in Russia, Austria, and France. Rubinstein might almost be said to be at his best in his ballets, and Tchaikovsky also wrote some master works in this line which every music-lover is eager to hear and see. London newspapers speak of a revival of the ballet in that city. Some time ago a variety theatre produced the "Coppélia" of Delibes, while another brought out Thomé's "Amour," both with so much success that the Opera Syndicate felt encouraged to revive Messager's twenty-year-old "Deux Pigeons."

Has Canada any national music? This question was put the other day by a representative of the London *Tribune* to Dr. Charles Harriss, "the most energetic and far-seeing of Canada's musicians." He replied:

Yes, decidedly we have; but you must go to the backwoodsmen, the logmen, the boatmen of our great rivers for it. There, indigenous among the older race of French settlers, you will find real folk-music. Sir A. Mackenzie thought he discovered traces of Scotch influence in it, but it is mainly French. Our present viceroy, Lord Grey, who interests himself with enthusiasm in all our artistic hopes, is at the head of a movement for the investigation of our folk-songs, and has himself arranged a water festival, which will presently be held, when representative singers from the backwoods are to chant their songs as they glide past the governor in their boats.

Dr. Harriss's career is a fine example of what a man of energy and ability can do in building up an interest in music. Twenty-four years ago he left England and went to Montreal, where he became organist of the Cathedral. He has composed music; he has taken an active part in the work of the Montreal Philharmonic; he has organized the musical department of McGill University; he helped in every possible way to foster musical education in his adopted country. In 1902 he began to extend his influence beyond Montreal by organizing a cycle of "peripatetic music festivals" held in the Canadian cities from Halifax on the Atlantic to Vancouver on the Pacific. English music alone was sung and played—the works of Parry, Stanford, Mackenzie, Sullivan, Cowen, German, Elgar, and the festivals were a great success. For the season of 1907-8 Dr. Harriss plans a similar festival, on a broader basis, so far as the

programmes are concerned, inasmuch as French music as well as British is to be performed; the French probably under the direction of Saint-Saëns.

The least popular of all varieties of the tonal art is chamber music. This is due partly to the limited range of the color scheme, which makes an orchestra so much more interesting than the usual string quartet. But probably the main reason is the stubborn conservatism of the writers of chamber music, who adhere to the tiresome and artificial old sonata form with a perseverance worthy of a better cause. While orchestral conductors have overtures and symphonic poems, and while pianists have short pieces innumerable to vary the symphonic or sonatal monotony, the chamber musician has to content himself with the unvarying cyclic piece in four movements.

England has a society called the Worshipful Company of Musicians, which, not long ago, offered a very generous prize for the best chamber music works of smaller dimensions and more free structure than the form which has heretofore been connected with this branch of the art. At a recent concert in London six examples of this new style of works, to which the name of Phantasies has been given, were played. To all of them prizes had been awarded. The first prize went to a "Phantasy in A," by the late W. Y. Hurlstone.

A German journalist in London suggests that "Parsifal" ought to be produced in that city, if only to demonstrate to the English that the stage is a worthy place for a quasi-religious work of art. He notes that when an opera by Massenet, in the last act of which an image of the Madonna comes to life, was produced at Covent Garden a few weeks ago, many left before that scene came on, while those who remained seemed afraid to applaud this act, thus showing what a low opinion they have of the stage. The renaissance of the English drama, he goes on to say, cannot be brought about until the advent of a Schiller to teach the British that the stage is not necessarily a degraded and degrading institution.

Leipzig is to have a new Bach monument, to be placed before the Thomaskirche, of which he was cantor twenty-seven years. It is to be made by Professor Seffner and will cost 50,000 marks, of which all but 2,000 is assured. The city contributes 30,000 marks.

THE FRENCH IN CANADA.

La Colonisation de la Nouvelle-France: Étude sur les Origines de la Nation Canadienne Française. Par Émile Salome, Professeur d'Histoire au Lycée Condorcet. Paris: E. Guilmoto.

Le Canada: Les Deux Races. Par André Siegfried. Paris: Armand Colin.

We were once told by Sir Adolphe Chapleau that, at the celebration of a silver wedding, he had sat down to dinner with a French Canadian mother and eighteen of her sons. Making allowance for the average infant mortality, this was an achievement well calculated to elicit fervent admiration from the dignitaries of both Church and State. Particularly in France, where a stationary population

gives cause for grave concern, are the pacific conquests of the French Canadian mother likely to call forth a tribute of praise. Nor is it matter of conjecture alone. During the past ten years French writers have devoted an amount of attention to the affairs of Canada which can be accounted for only by the fact that the growth of the French in America is becoming a source of pride to the economists and historians of Paris. The new attitude is defined with perfect clearness by M. Siegfried in the following passage, which is taken from his chapter on "Canada and France":

Though for a whole century we made the great mistake of forgetting almost completely these brothers who have become separated from us, we have fortunately abandoned such culpable indifference, and are now beginning to understand (late, it is true, but not too late), that, putting aside all regret for the inevitable, a noble possibility still lies before us: to aid this sister civilization, to profit by it in extending the field of our commercial activity, and, in a measure restricted but appreciable, to benefit by it in defending some of our political interests.

We have before us two excellent books, both of which owe their origin, one may be sure, to the fact already mentioned. "La race canadienne a pris racine" are the concluding words of M. Salone. "Il ne saurait d'abord nous être indifférent que près de deux millions de Français—plus de deux millions si l'on compte ceux de la Nouvelle-Angleterre—maintiennent fièrement en Amérique leur existence, leur langue et leur culture propre": such is the basal consideration of M. Siegfried. Both writers have approached their subject seriously, and paid French Canada the compliment of investigating before writing. As his title shows, M. Salone confines himself to the original settlement. M. Siegfried, on the contrary, devotes no portion of his space to the recital of the steps whereby the French in Canada have come to occupy their present position. Assuming that his reader is familiar with the essential features of the national history, he sets out to consider existing conditions. We have brought these volumes under a single title simply for the sake of emphasizing the degree of interest which France now takes in Canada. The phenomenon is relatively new and deserves some notice. Otherwise the books in question require the separate criticism which we shall now proceed to offer.

When an English writer sets out to describe the Old Régime in Canada, the reviewer's first instinct is to see how much has been pilfered from Parkman, and unfortunately in many cases the indebtedness amounts to more than the law allows. By way of contrast M. Salone goes forward with complete independence of his leading predecessor. Parkman's name is omitted from the bibliography which stands at the opening of the volume, while opposite Casgrain's 'Montcalm et Lévis' appears the note, "le livre définitif sur la guerre de Sept ans en Amérique." Neither in the body of the text nor in any of the abundant footnotes have we seen more than one allusion to a work which nine people out of ten in the United States and in the English part of the Dominion would immediately say was the chief contribution yet made to the historical literature of Canada. It cannot be imagined that Parkman's celeb-

rity is unknown to M. Salone. Two inferences remain. Either our author wishes to make his study represent a perfectly fresh scrutiny of the materials, or else he looks upon Parkman's works as negligible. We can easily understand that he should wish to reach his main conclusions unaffected by the views of any other writer, but why, having arranged his conclusions, he should not place them beside those of Parkman we cannot see. The French Canadian historians—Garneau, Faillon, Ferland, Casgrain, Chapais, Sulte—are referred to frequently, nor is there any disposition to pass over the contributions of Rochemonteix and Lorin. Parkman alone, and he, in our judgment, the most conspicuous writer on the Old Régime in Canada, seems systematically boycotted. On the one occasion when he is mentioned (p. 453) the allusion is but slight, and his name is misspelled.

We lay some stress upon a fact which has caught our attention and from its singularity occasions much surprise. Speaking more at large, M. Salone is under no obligation whatever to any English writer, but draws the bulk of his materials from the *Archives du Ministère des Colonies*, the archives of Quebec, the *Édits et Ordonnances*, the *Jugements du Conseil Souverain*, the reports of the Jesuits and Sulpicians, and other sources of a similar kind. These have been supplemented by a study of the leading monographs produced in France and in French Canada. M. Salone considers the problems of colonization as they appear through the course of French rule, and investigates with much thoroughness those features of the administrative system which can be made to elucidate the process of settlement. Beginning with a geographical account of the region occupied by the immigrants, he passes from period to period in the annals of New France until the final catastrophe is reached. On the topographical side the work is particularly valuable, and an immense amount of detail has been forced to yield definite conclusions regarding the state of the seigniories from their establishment until the Cession.

At one point less information is given than we might have wished. M. Salone is content to take over from Ferland, Faillon, and Rameau his analysis of the population according to origin. And even in stating Ferland's results he is not quite accurate. Thus, when speaking of the Norman group, he places it at almost one-half of the total according to Ferland's conclusions, but the figures upon which he bases this statement show the Norman element to have been barely more than 30 per cent. We could point out a number of loose statements, and a few distinct mistakes. In the former category may be placed the remark that about Montreal the snow disappears before the first of April, and the application of such a phrase as "vainqueur des Bostonnais" to the leader of a French and Indian raid. Among the larger errors is the remarkable piece of mistranslation which occurs just at the close of the volume. M. Salone, after stating that in 1763 the French race was so far rooted in Canada that it could not be dislodged by the conqueror, proceeds thus: Et voici l'aveu de découragement qui, dès 1767, échappe au général Carleton, le second gouverneur de Québec, le successeur immédiat de Murray: "Le dénouement in-

évitable, écrit-il à lord Shelburne, chose horrible à penser, c'est que ce pays devra à la fin être peuplé par la race canadienne, laquelle a déjà pris racine et atteint un si haut chiffre que toute autre serait entièrement perdue, sauf dans les villes de Québec et de Montréal."

Now the actual words of Carleton to Shelburne run as follows:

But while this severe climate and the poverty of the country discourage all but the natives, its healthfulness is such that these multiply daily, so that, barring a catastrophe shocking to think of, this country must to the end of time be peopled by the Canadian race, who already have taken such firm root and got to so great a height that any new stock transplanted will be totally hid and imperceptible amongst them, except in the Towns of Quebec and Montreal.

Obviously Carleton is not saying that the presence of the French is a catastrophe, but that, barring a catastrophe, they will always inhabit the valley of the St. Lawrence!

We do not present a complete catalogue of the slips we have observed, because the book as a whole is a good one and embraces a wealth of interesting detail regarding the circumstances which attended the settlement of the French in Canada. It is admirably written, and deserves to rank among the best historical monographs that have come to this side of the Atlantic from France.

In estimating M. Siegfried's study of contemporary problems in Canada, we must first state that the author is well fitted by birth, training, and intellectual temperament to write upon the complicated phenomena of Canadian life. A highly educated French Liberal, who has freed himself from the narrower prejudices of anti-clericalism, a traveller who is thoroughly familiar with English life and has already written an excellent book on New Zealand, a quick observer and a lucid writer, he enters the field with many advantages. Moreover, he shows both tact and fearlessness in his account of the Canadian temper. The political institutions of the country are not difficult to understand, and any clever youth could prepare an octavo upon them without once leaving the shades of the Bibliothèque Nationale. Such difficulties as arise, and they are many, may be traced to the peculiarities of the position occupied by the French in Canada. These, too, it is quite possible to apprehend in a purely intellectual fashion without once setting foot in the country. But nothing short of personal familiarity with the life which is led in the region of the Two Canadas can justify a European, whether French or English, in attempting to pronounce judgment upon the politics of the Dominion. M. Siegfried has lived in Canada long enough to know what the races think about each other, and to appreciate the paradoxes which arise, not only from the situation wherein the French Canadians have been placed by a strange chain of circumstances, but from the remarkable plight of the English—conquerors and a majority, but yet a majority that is unable to carry out a scheme of national education. M. Siegfried came to Canada and talked with all manner of men. Priests, as individuals, confessed to him their strong interest in contemporary France, while yet, as ecclesiastics, they were forced to declare anathema against her. He caught the echoes of the last

general election in Ontario, and can repeat the cry of Conservative election agents opposing Laurier with the argument, "Don't vote for that damn Frenchman." He has even found out the idiosyncrasies of the Protestant sects, which he touches off with much wit and a sufficient amount of truth. Matthew Arnold felt sure that he knew all about the dissenters of England and could distinguish a Methodist from a Baptist by talking with him five minutes about the weather. Whether M. Siegfried could make this boast about the Protestants of Canada, we shall not pretend to say; but he certainly has kept his eyes open. Where, for instance, is the Scotchman who would rebel against the following little hit: "L'intransigence des mœurs mise à part, les presbytériens deviennent les plus agréables des compagnons. Leur franchise cordiale et leur sens de l'hospitalité sont célébrés."

Possessing talent, objectivity, and a first-hand knowledge of his subject, M. Siegfried spares no pains to reach by careful analysis the essentials of Canadian life—on its political side. The Roman Church is so great a factor in politics that some account of its ecclesiastical position becomes necessary. The school question is so fundamental that conflicting types of instruction must be described. Otherwise, the interests of the volume are limited to issues which may be termed political in the narrower sense of the word. Racial and religious differences as furnishing the groundwork of party cleavage are placed in the front of the canvas, and involve an account of complications which are not purely local. For example, the attitude of the French Canadian Catholic towards the British Government centred in Downing Street is more cordial than his attitude towards the average English Canadian who walks the streets of Montreal or Toronto. The extreme loyalty of the Latin Church in Canada to Rome brings in another non-local element. The sentimental attachment (quite divorced from any wish of political union) which many of the French Canadians feel for the land of their origin, causes glances at times to be cast across the Atlantic, leads M. Louis Frechette to burst forth in verse when a French warship enters the St. Lawrence, and makes Sir W. Laurier show more real enthusiasm when in Paris than when in London. Thus an allusion to French versus English in Canada brings in not merely the mutual relations of the two races as Canadians, but suggests the outlook of each towards London, Paris, and Rome.

M. Siegfried recognizes this fact in all its bearings, and makes the arrangement of his book conform to it. He also sees how strongly the influence of the American continent in general and the activity of the United States in particular are likely to affect the ideals of both races in Canada. We do not imply that M. Siegfried is a political prophet who dogmatizes in favor of annexation or any other solution of a mixed predicament. His forecasts are so non-committal as to be merely a summarizing of conflicting factors, a simplification of the leading facts. But, looking to a future which is not remote, he sees the conquest of Canada by American manners, business methods, and intellectual outlook.

Whether the bishops will be successful in protecting their flocks from such an inroad, is a large and doubtful question. On the other hand, M. Siegfried can see how powerfully the English in Canada are reacting to this stimulus: "Je ne veux pas dire par là que le péril d'une annexion soit écarté. Il existe; mais, comme nous l'avons montré plus haut, n'est sous une forme autre que celle de la conquête militaire ou politique. Ce n'est pas la nation américaine qui menace la nation canadienne; c'est plutôt la civilisation américaine qui menace de supplanter au Canada la civilisation britannique."

While it would not be easy to improve upon M. Siegfried's minute and systematic account of the Catholic Church in Canada, and while his notice of the school question as a thorny point in legislation is likewise admirable, we have found special interest in observing his opinion of the Canadian attitude towards imperialism. This new force presents itself under two main aspects, economic and military. As for its economic side, it is quite allowable to speculate concerning the degree of willingness which the English-speaking manufacturer in Canada will eventually show in surrendering percentages of his protection for the benefit of his British competitor. Similarly, the final deliverance of the French Canadian upon the subject of military imperialism is fair matter for guesswork. Not, in the latter case, that one can doubt the natural unwillingness of the French Canadian to send money abroad for military purposes, but that the extent of his unwillingness has not yet been accurately gauged by experience. M. Siegfried does not look for any signal triumphs of the imperial spirit in trade relations until Great Britain shall have adopted a policy of protection—in other words, for a long time. As for military imperialism, he does not think that present indications point towards the establishment of centralization. "The Canadians, instead of imperializing the national services, think only of nationalizing the imperial services." From this dictum it is an easy inference that the military policy of Canada at the present moment inclines towards nationality rather than towards imperialism. M. Siegfried appreciates exactly the position of M. Henri Bourassa, whose speeches in the House of Commons and whose article in the *Monthly Review* have aroused much resentment among English imperialists in Canada. The imperial idea as linking Great Britain and her colonies has its roots in sentiment. Now the French Canadians are destitute of any sentimental attachment to the country that conquered them. They look upon the Quebec Act in the light of a treaty rather than of a law. In the language of M. Bourassa: "Notre fidélité à l'Angleterre ne peut et ne doit être qu'une affaire de raison."

Slips in this volume are few and not very important. On page 117, a printer's error gives a wrong date to Laval; on pages 17-18, a rather misleading allusion is made to the scope of the Jesuits' Estates Act; on page 113, we doubt whether M. Siegfried has got to the bottom of a celebrated resignation; and on page 74, there is a passage in which "Broad Church" appears instead of "Low Church." On the whole we have been impressed by the distinctness and ac-

curacy of M. Siegfried's knowledge no less than by his fairness and discernment. Goldwin Smith has written of Canada with more incisive pen. M. Siegfried does not aim at being incisive in the sense of being controversial. Aiming at the clear and impartial description of existing conditions, he has given us a book which yields to none in the literature of its subject for candor, acuteness, and grasp of the whole situation.

TWO RECENT NOVELS.

A Son of the People. By the Baroness Orczy. New York: G. P. Putnam's Sons. 1906.

In Cure of Her Soul. By Frederic Jesuo Stimson. New York: D. Appleton & Co. 1906.

There are who find perpetual nourishment in the story of a forced marriage converted into a conjugal triumph. Usually the pair are really in love with each other all the time and do not know it. Sometimes the bourgeois husband is too considerate to express his sentiments to his aristocratic helpmeet until the last page. Nothing indeed equals the rudeness of the aristocrat except the elegance of the peasant. Again, it is a rough bear who begins by frightening the shrinking dame—never the well-seasoned reader—and ends by proving to her that his brutality was only a form of shyness. Neither of these examples quite covers the case of "A Son of the People," yet to lovers of the "won after marriage" school of fiction this novel may safely be commended. Of course, in all such stories the satisfactory untying is to be counted on, but in this one it comes with singularly little cause, except the nature of the novel. Perhaps that is enough. At all events, to accept the conclusion as it comes is to leave one the freer to note those traits of the book which separate it from its kind.

It is only secondarily a love story and primarily a Hungarian picture. "An absorbing, a passionate fondness for the lowlands, the wild mysterious plains of Hungary" inspires the writer and is happily conveyed to the reader. The far-away horizon trembling in the intense heat, the vision of a white city rising in the distance, the horse and his rider, make a canvas that lives to the eye and in the memory. The pendent pictures of village life and noblemen's entertainments are fairly splashed with color, ranging from gloomy to lurid. Where peasants' wives rejoice in the blows their husbands inflict, as proof of affection, it is not surprising to find peasant men burning their neighbors' crops as expression of their disapproval of modern machinery, or to find the nobles persecuting the Jews. A great primitiveness invests this life, shut out entirely from latter-day ideas or confronted by woe when it opens ever so little to let them in. Life is a satisfaction to the man who has flour, wine, a few sweethearts, and a horse; it is a rapture if he can also acquire a bit of land. Thinking and reading may be done for all the neighborhood by the good priest and the hero whose rugged strength and merry affability make him a leader of men. This really interesting book is hurt by wordiness and repetitions of good effects, yet not unto destruction.

Whether or not Mr. Stimson wrote his latest book keeping pace with a serial, it

has the faults which the serial form imposes. It covers far too wide ground, abstract and concrete, going on from interest to interest quite too much as life does, or a monthly call for copy. Instead of related groups of selected incidents, there are unrelated patches of unrestrained detail. Pinckney as a lawyer fighting railroad corporations is a sketch by himself. Pinckney as a student of sociology joining labor unions, arbitrating strikes, defying Trusts, is another. Pinckney pursuing grizzly bears, Pinckney promoting gigantic irrigation schemes, Pinckney the reformer politician, is exploited in each of his activities at excessive length. And there are still his love affairs to be considered: his marriage, his brief temptation, his Dantesque passion for his modern Beatrice of the settlement. These seem to leave no room for more, yet there is much more of both sketch and elaboration; of Rivington Street, of society, of Wall Street, of a sweet old Maryland garden, of Cambridge, Beverly, Newport, New York, Baltimore, Colorado, the Connecticut River, and of Taormina. Of these drawings the scenery is invariably attractive, the portraiture as a rule distinct. The society chapters, it seems, might very well have been Bowdlerized. To indicate the vices of a degenerate society without offence requires a tact and taste which if Mr. Stimson possesses he has not here chosen to display. We incline to think he has the qualifications, but that he has elected, no doubt from high motives, to make his picture gross rather than suggestive. His command of words, his ingenuity in epigram, his control over phrase, forbid the thought that he has said unintentionally anything that he has said; therefore it is with a misguided taste that he must be taxed.

The lessons of the book are mainly noble ones, developed with much generous interpretation of motive, much poetic breadth of vision. Particularly to be cherished, for example, are the views of the settlement girl upon the question of the work to be done for working girls by women. "The hardest thing I find? . . . To keep them from copying the wrong models—and to make them see the right ones. . . . They are not advertised. Work girls cannot imagine them; they have to meet them." "It is not so much the luxury, the comfort that the rich can really use, if only for themselves—it is the show of senseless possession. . . . We must get ideals—it comes back to that—we must learn not to be vulgar in our hearts." The triumph of duty is sung consistently, if too discursively, leading, to be sure, to no conventional "happiness ever after," but to things more important.

Leo Tolstoy: His Life and Work. Autobiographical Memoirs, Letters, and Biographical Material, Compiled by Paul Biriukoff, and Revised by Leo Tolstoy. Translated from the Russian. Volume I. Childhood and Early Manhood. New York: Charles Scribner's Sons. 1906. \$1.50 net.

It was a happy thought to compile materials concerning the activity of such a personality as that of Count Tolstoy before death should render correction of errors difficult or impossible. For such a compila-

tion Mr. Biriukoff, whose adoring discipleship of, and close friendship with, Tolstoy has extended over more than twenty years, is, in some respect, well fitted. In fact, the banishment of Mr. Biriukoff from Russia, to which he alludes in his preface, was directly due to his ardent advocacy of some of his "Master's" theories, and attacks upon the established order. One can pardon somewhat his lack of literary skill, in view of his transparent honesty, and modest attitude toward his work as "material" for the use of more competent workers hereafter. Unhappily for future biographers who may resort to this material, Mr. Biriukoff has not always verified and correlated dates. For example, he says that Tolstoy's father and Tatiana Yergolsky "were born in the same year," but afterward he gives the dates two years apart. The references to certain persons are occasionally misleading. Countess A. A. Tolstoy (once or twice mentioned in full as Countess Alexandra Andreevna Tolstoy), herself a famous and important personage at court during three reigns, is sometimes called the great author's "aunt," sometimes "the friend of his youth," and sometimes she has no special designation. The uninitiated reader could not determine whether three women are alluded to or one, and what the real relationship is.

The autobiographical contributions to this volume possess the wonderfully vivid and appealing qualities with which we are already familiar in the author's works of fiction and personal record. His descriptions of scenery, of inward moods and motives, and of the characters and actions of the people about him are as fine as anything he has ever penned. As Tolstoy will, indubitably, figure extensively in many future as well as present lists of "books which have influenced me," the writings which influenced him at various stages of his career, are particularly interesting, and at times rather surprising. The self-questionings and strivings for perfection, the faith in its possibility, the extensive programme of reading for self-improvement, and the rules of conduct are also characteristic. "I have no modesty," he writes in his diary, during the Crimean war; and then proceeds to contradict himself by a self-drawn portrait which is about equally divided between pitiless truth, and misrepresentation which might lead astray any one not personally acquainted with him. It is at this time that he records the conception of an idea to found a new religion, which he attempted to carry out thirty years later with "What I Believe" and subsequent writings.

There are repeated evidences that as a writer Tolstoy not only never experienced the pain of "rejected addresses," but was from the first hailed by rival literary men as destined to be the greatest of all—which did not conduce to a low estimate of his own work and talents. His Diary contains the most convincing autobiographical material, because devoid of the rather strained and oppressive self-consciousness which characterizes the passages deliberately prepared for the biography.

The numerous illustrations, portraits of Tolstoy's ancestors, of himself at different ages, of his young wife, his house, his

village, etc., are all of interest, although some of them are not wholly unfamiliar to the public.

This work will be reviewed in greater detail when all the volumes are published.

George Douglas, Eighth Duke of Argyll (1823-1900). Autobiography and Memoirs. Edited by the Dowager Duchess of Argyll. 2 vols. E. P. Dutton & Co. \$10 net.

"What I admire in this," said Dr. Johnson, when, on tour to the Hebrides, he stood looking at the ancestral seat of the Dukes of Argyll, "is the total defiance of expense." The reviewer contemplating the almost equal pile of this biography—more than 1,200 pages—detects defiance of various things—order, proportion, neat finish, whether in parts or in the whole. The late Duke himself wrote some 700 pages of his autobiography, and in them he found room and verge enough for his *longueurs* and irrelevancies. Moreover, he could write deadly dull. This, for example, is the ducal way of making things simple:

When we speak of new scenes as making a great impression, we employ a familiar image taken from the effect produced on soft substances by the physical pressure of a seal, or by the contact of some other external substance, exercising an impressing force, and leaving a mould or cast of itself on a clay, or on wax, or some other recipient and yielding surface.

Too many such sleeping potions are offered the reader. When the Duke lets himself go on the intricacies of feudal land tenure in Scotland, or loses himself in the mazes of Scottish ecclesiasticism, or discourses on the land cess in India, his amplitude and dreariness are oppressive. This is the stranger because, in speeches and letters, the Duke of Argyll was often forcible by compression. He began writing this autobiography to occupy his old age; and seemingly fell a victim to that desire to leave nothing unsaid, which often possesses the garrulous veteran. Yet he remarks with fine unconsciousness that he was "never under any temptation to write for writing's sake, which is known as 'padding.'" And he records as if it were a great natural curiosity the fact that a presidential address of his at Glasgow put Whewell to sleep. It is not given to all Dukes to be aware of their fatal power.

The long career of the Duke of Argyll was filled with notable activities. Acceding to the title very young and unexpectedly—through a collateral branch of the family—he was of serious and energetic bent. Early called to a share in the Government, he was a member of several Cabinets, and played a considerable part as much in virtue of his hard work and sagacity as because of his rank. For years he was an enthusiastic follower of Gladstone, but broke with him on the land question and Home Rule; but their personal friendship remained unimpaired. Yet his chief distinction was as a controversial writer. He had considerable scientific attainments. From early life an eager naturalist, he had named all the birds, not always without a gun, and was practically skilled in geology. He read widely in science, too, and being, as he innocently observes, "inclined to question rather than to harbor doubt," he "took

most naturally to religion and theology." A good part of his fame was that of the man who had exposed the fallacies of evolution. As such his "Reign of Law" used to be re-preached from a thousand pulpits. But time has put that right. It was too much of a piece with other manifestations of the Duke's versatility—his painting, his making verses; amusing but evanescent. In general literature it does not appear that he had catholic tastes. He was a great admirer as well as personal friend of Tennyson. To Wordsworth also he was devoted: "even the ponderous pages of 'The Excursion' and 'The Prelude' have never, when I have had time to read them, ceased to throw over me a certain spell." A thorough Scot, contradictory, hair-splitting, voluble, fervid, we do not imagine that the Duke of Argyll would have led Coleridge to modify his dictum that "Scotchmen with a little literature I have generally found disagreeable."

During our civil war the Duke was an outspoken friend of the North. He perceived from the first that the struggle was one for national existence; and from the beginning he also contended that the war was about slavery, and would lead either to its extinction or its exaltation. For taking this position when a Minister of the Crown, he was long held in grateful remembrance by Americans. Praise and thanks came to him from Motley and Beecher and Longfellow and Whittier. The latter wrote him in 1871:

Hast thou never thought of making a visit to the United States? Our people would welcome thee as their friend in the great struggle for Union and liberty, and in our literary and philosophical circles thou wouldst find appreciative and admiring friends.

The Duke made a short tour in this country in 1879. Writing of it to Gladstone, he said: "I was delighted with all I saw in the New World, differing as it did in many ways from any expectation I had formed of it. . . . Longfellow was very well, and as charming as ever. I have always thought his countenance such a beautiful one. . . . I was made ill by the fearful heat in New York, where the thermometer was 100 in the shade during the two days I was in it." Of Mrs. Stowe the Duke saw a good deal, "when," to quote the original Argyll, "the unparalleled circulation of the book in England involved pecuniary transactions of corresponding magnitude, it became necessary for Mrs. Stowe to visit Europe." At first, he was disappointed in the "small and most inconspicuous woman," who would not pose or be oracular, but he soon conceived a great admiration for her. The Duchess of Sutherland gave a large reception to Mrs. Stowe, and "the tiny personality of the great writer was almost lost in the gilded and lofty surroundings of that beautiful room, whilst the magnificent figure of the hostess looked like some splendid bird of paradise mothering under her wings a little black chick." The Duke heard one of Emerson's lectures in London. "It was full of a dreamy beauty," but there was "no continuous thread of thought." "It was like the diffused perfume of Christian ethics, but without its doctrine, and therefore without its power." The whole Duke is in that "therefore."

Monographs, Garrick, Macready, Rachel, and Baron Stockmar. By Sir Theodore Martin, K.C.B., K.C.V.O. New York: E. P. Dutton & Co. 1906. \$3.50 net.

These monographs are all reprints, with the exception of a few details added for the sake of completeness and finish. The "Garrick" was first published in 1868; the "Stockmar" in 1872, and the "Macready" in 1875, all in the *Quarterly Review*, while the "Rachel" was published in *Blackwood's Magazine* in 1882. The fact that they are to-day singularly fresh, authoritative, and fascinating is a sufficient proof of their innate excellence. Of the three theatrical studies, indeed, it is not too much to say that no student of dramatic history can afford to be without them. Sir Theodore Martin is a nonagenarian, who throughout his long and industrious life has been intimately and actively associated with the leaders in political, literary, artistic, and social affairs, and not only writes with the authority of personal knowledge, but with the force and judgment of the student and scholar, and the compact and fluent arrangement of the practised author. His facts are wisely selected and carefully substantiated, his opinions—never rhapsodical eulogies—are fortified by simple quotations from various and weighty sources, and his criticism, whether favorable or unfavorable, is acute, clear and unexaggerated.

Of course he has nothing new to tell about Garrick, Macready, or Rachel. Concerning all of them there is an immense bulk of contemporaneous or posthumous testimony, and all readers are familiar with the main details of their public life and private character. What he has done is to select from the mass of evidence such salient facts as furnish a vivid intellectual image of the individual. His essays are, as it were, the essence of all that the most competent witnesses have told. A word of warning is, however, necessary. In all his statements of fact, Sir Theodore may be trusted implicitly, and there can be no doubt that he is always, in intent at least, scrupulously fair, but in reading his final estimate of Macready it must not be forgotten that he was the husband of Helen Faucit, whose earlier stage experience was a good deal embittered by the famous tragedian's passionate, jealous, and egotistic temper. Also it should be remembered that in genius and character Helen Faucit was in almost every respect the opposite of Rachel, her rival in fame, and, therefore, probably, but little disposed to put a charitable construction upon the brilliant Frenchwoman's expressed impatience of the restraints of civilized society. It is not impossible that her husband sometimes saw with her eyes. As for the panegyric upon Stockmar, who by general admission was a man of extraordinary political ability and disinterestedness, it must be noted that Sir Theodore, when he wrote it, was practically the mouthpiece of Queen Victoria, who held the baron in the highest estimation.

To the study of Garrick Sir Theodore brought a mind free from all bias, complete information and a ripe judgment. In his youth he must have known men who belonged to the great actor's generation and could speak of his powers and conduct from personal observation. He was all the more likely, therefore, to form a just

appreciation of his subject, and it is pleasant to find this so entirely favorable. He is at especial pains to prove—and that, too, by strong evidence—that, so far from being niggardly and vain, Garrick was most generous in all deserving cases, and if fond of applause and somewhat eager to attract attention was, at all events, notably free from that particular form of vanity—with which Macready was so afflicted—that bears no rival near the throne. He never feared that his own brilliancy might be dimmed by that of his associates. The ablest performers of the time were grouped under his standard. Sir Theodore has a pertinent comment on this fact. "On the stage, as elsewhere, power kindles by contact with power; and to the great actor it is especially important that he secure himself, as far as he can, against being dragged down by the imbecility of those who share the stage with him." Regarding his managerial ability there is a suggestive passage in a letter written to him by Kitty Clive. She says: "There are people now upon the stage to whom you gave their consequence; they think themselves very great; now let them go on in their new parts, without their leading strings, and they will soon convince the world what their genius is." Garrick, doubtless, like many another great man, suffered much from envious detraction. Even Sarah Siddons was not ashamed to speak slightly of the manager who was among the first to discern her talents and incurred much ill-will by his eagerness to push her forward in spite of the indifference of the public. Sir Theodore Martin quotes many instances in which Garrick sought to help others to his own loss.

It required some courage to write about Macready, thirty years ago, with the frankness which Sir Theodore employed. Admirable actor as the former was in certain parts, and valuable as were his efforts as a stage reformer, he never was altogether worthy of the pinnacle upon which some of his eulogists would place him. His attitude toward his calling, and his associates in it, is only too well known even to those who have only read his own journals. Once he said publicly of acting that persons who could find any other occupation would not take to one in which they were entirely dependent upon the favor of the public. "It was an ungracious speech," says Sir Theodore, "considering that the public had been kind to him to the full measure of his deserts. But it had a farther and a deeper significance, because it showed that the speaker wanted the first element of greatness—a thorough faith in his art, as in itself worthy, without reference to the measure of popular appreciation or of money value." It is a bitter saying, and "pity 'tis, 'tis true." But after all, Macready, perhaps, was the proper object of pity rather than blame. Throughout his professional life he suffered tortures from the infirmities against which he struggled in vain.

Sir Theodore's sketch of Rachel is illuminative, attractive, vital, and convincing. In her case, as in Macready's, he does not have to depend upon the verdict of others. He saw her act in her prime and in her decay. His judgment of her is careful, analytical and doubtless just. In her interpretation of the fierce passions of classic tragedy, he holds, that she was, at her

best, supreme, incomparable; but the softer and more gracious attributes of feminine nature she could neither understand nor portray. Nor was she at all inspired by the spirit of comedy. Perhaps it was the coarse and wretched Bohemianism of her youth that prevented the development of purity and delicacy in her nature. Hers is one of the saddest of all stage stories, and Sir Theodore closes it very fittingly with a "Pauvre Rachel!"

The monograph on Stockmar is a fine bit of friendly appreciation, which, perhaps does not do much more than justice to the memory of an uncommonly shrewd, sagacious, and devoted man. Younger readers will be astonished to hear of the great hut silent part played in European history by this political dry nurse of princes. For those who already know something of the jealousies, anxieties, and suspicions of the early Victorian era, this little essay will not afford much information. But it is interesting reading, nevertheless, as is the whole book.

The Making of Modern Egypt. By Sir Auckland Colvin. E. P. Dutton & Co. 1906. \$4 net.

Sir Auckland Colvin was Comptroller-General in Egypt between 1880 and 1882, and Financial Adviser to the Khedive from 1882 to 1883; in describing the recent history, and happily of late the progress, of the Valley of the Nile, he therefore treats elaborately, though not exclusively, of the shifting financial situation. As the history is told by one who not only knew and had official intercourse with the principal actors—native and English—who have made modern Egypt, but also himself took part in some of the most eventful of the incidents, it carries authority. He was, for instance, an official in Egypt, when, after the crushing of the Arabi Rebellion, Lord Dufferin, the British Ambassador at Constantinople, was sent to Egypt, to report on the utter demoralization of the land, and to suggest remedies; which, in his ignorance, he bravely did. One of the practical questions he had to solve was the disposal of the arch-rebel Arabi and his principal co-partners, whose army "had vanished like a puff of smoke" before Lord Wolseley's advance, but who themselves remained as troublesome realities. The simplest solution would have been to cut off their heads in proper Oriental fashion, and this would probably have been the disposal made of them, had not the generous, warm-hearted Lord Dufferin appeared on the scene while the farce of the trial was in progress. He accepted the confession by the rebels of guilt in exchange for banishment to Ceylon. The incident, in its motives and effects, has been the subject of much contradictory comment ever since, and therefore the opinion of one of the prominent officials in Egypt at the time is worth noting. Sir Auckland Colvin remarks:

It was not to be gainsaid, on the one hand, that, if the Khedive held the rebels in his power, it was due to no merits of his Government, but to the exertions of British troops. . . . But for British intervention, the prisoners and their friends would have thrown the whole house of Muhammad Ali, hag and haggage, into the Red Sea. The Khedive could not be allowed, under benefit of the intervention of

a civilized Power, to make himself arbiter of their fate. It was for the Power that had subdued them to punish them. All this was unanswerable, and public opinion in Great Britain, flushed even by success over an Egyptian army, was disposed to show itself generous. Vanity was flattered by an occasion for the display of magnanimity; for magnanimity, like charity, may be indulged in without cost, if exercised at the expense of a third party.

There came the rub. The third party was the Khedive. The cost of British clemency had to be met by Tewfik Pasha, and the eclipse of the Khedive's authority was the measure of that cost. The British had landed in Egypt not to destroy the authority of the Khedive, but to restore it, and to retire. But, had they wished to destroy it, and to make prolonged occupation of Egypt necessary, they could have adopted no more effective means than by remitting the death sentence on rebellious officers in arms. In the autocratic East, the degree of submission to the ruler depends on the public estimate of his power, and this again depends on the free and unfettered use which he is seen to make of it. If the Khedive might not punish condignly the very head and front of offenders, his authority fell to the ground; nor could all the Queen's horses nor all the Queen's men raise it up again. The authority of the Khedive might still be maintained, as to the day of Tewfik's death and as under his successor it has been maintained, by foreign bayonets. But foreign bayonets must be kept in Egypt to support it. However sincere, therefore, the British Cabinet may have been in the expression of its wish to withdraw its troops from Egypt at the earliest opportunity, it is not he wondered at if the foreign colonies in Egypt, and the Governments to which they were subject—still less if the Khedive himself—regarded the clemency shown to the rebels as based upon the methods of Machiavelli. It was generally believed in Egypt that, though it might be the declared wish of the British to retire when the Khedive's power was restored, they had adopted, curiously enough, the one course calculated to prevent the restoration of his power.

A Liberal Government, led by Mr. Gladstone, after bombarding Alexandria and occupying the country, spurned the idea of governing Egypt as a tributary province under a resident, and yet brought about this same result, more drastically, by appointing as Consul-General and adviser to the Khedive, in 1883, Sir Evelyn Baring. He had spent three years in Egypt under the rule of Tewfik, as Major Baring, and now returned to grow in rank and influence till as Lord Cromer he has become in reality, though not in name, joint ruler of Greater Egypt as far south as the Equator. Just as the English army of occupation was about to withdraw in fulfillment of England's pledge the revolt of the Mahdi and the Gordon tragedy, and the advance of the Dervishes on Egypt, obliged England to call a halt. Thereupon followed the tedious campaign against the Mahdi, conducted over a railroad which was built for military purposes, but which has since been the most efficient agent for completing the peaceful conquest of the Sudan.

All this is related with much amplitude of statistics, and with the unimpassioned fairness and exactitude of an accountant. But occasionally there are hits of sparkling descriptions which relieve the tediousness of the narrative, as when Sir Auckland touches off in the following paragraph the salient features of the character and behavior of the English and French colleagues.

Keen of wit, incisive of tongue, choleric

of disposition, sensitive as children, kindly as women, the Frenchman was the very opposite of the phlegmatic, imperturbable Briton. . . . Which of the pair did the most useful work it was not always easy to say, but the paces and showy movement of the Frenchmen were effective. They were never seen on the tennis court, nor in the saddle; nor did field sports attract them. Constant and often heated discussion with one or other was their relaxation; the black official portfolio their symbol; the frockcoat their habitual garb. There must have been something abhorrent to their passion for correctness in the negligent costume, the slack disregard of formality, the indifference to the outward and visible signs of office, which in Egypt, as elsewhere, distinguish Englishmen. But difference of temperament and of training seemed to draw together, rather than to repel. To their honor, be it said, the French sought to do their duty as conscientiously by the country which employed them, and by the colleagues who worked with them, as though their portion had been in France and their colleagues of their own nation.

On the whole, the hook, despite the many romantic phases of the subject, is not exciting reading, but it supplies the safest guide to those who may wish to study one of the most interesting and far-reaching series of events which have occurred in our own time. It is an excellent supplement to Lord Milner's "England in Egypt," written after he had resigned the under-secretaryship for finance in that country. His fascinating hook, published in 1892, balances hope against despair. Speaking of the financial situation then, in the last paragraph, he says:

Of course it may be contended that, though financially the enterprise costs us nothing, Great Britain has not the strength to carry through the regeneration of Egypt consistently with the fulfilment of other and prior duties. To such arguments, if they can be established, all reasonable people would be prepared to listen, including, I hope, the present writer, who has now said his last word on this thorny subject, and whose constant aim has been to state the Egyptian Question temperately—recognizing, to the full, all the difficulties of our position, honestly admitting all its weaknesses. But in the absence of such arguments—and they are not yet forthcoming—the case for Perseverance holds the field.

Colvin's hook shows how perseverance, practised by honest financiers and an able administrator, has conquered.

Five Years a Dragoon. By Percival G. Lowe. Kansas City: The Franklin Hudson Publishing Co.

Soldiers' autohographies, seldom interesting to strangers, and more rarely of value to any one, have been common enough since 1865. But the experience of an intelligent regular before the civil war now appears for the first time. In "Five Years a Dragoon" Mr. Lowe embodies ten years of military life, five in the mounted ranks, and five as a high-grade quartermaster's employee, in active service on the great plains, beginning in 1850. The story was well worth waiting for, for besides its interest as "a human document," as the phrase goes, it is the history of a past never to be repeated, and full of peril and of an excitement that closely approaches romance. It is an enlisted man's supplement to Marcy's account as an officer. It describes from the inside that life of frequent storm and stress of which Parkman caught glimpses along "The Oregon Trail." There is nowhere a formal

record of how the rough and often dissipated recruits were transformed into iron soldiery, who held positions or died in their tracks with no other thought than that of duty. No drill-book teaches the art. But the careful reader sees here that the officers, who were also gentlemen, encouraged the worthy, controlled the unruly, administered justice, and enforced obedience with an impartial and relentless hand, and solely for the public good, thus establishing a standard to which each in his own grade was insensibly drawn. Lost to the popular eye in the hordes of volunteers, the little army thus created was more than "a stone wall"; it was from end to end a *corps d'élite* that never had, and doubtless never will have, popular recognition of its service in the dark and stormy days of the rebellion. Ravaged by hostile fire, impossible to be recruited under the counter inducements for volunteers, it was frayed into nothingness before Appomattox was reached, and its reconstruction became a weary and difficult task.

Mr. Lowe's relation is a new proof that "the Captain and the First Sergeant make the company." In later days he would have been commissioned long before his enlistment had expired. Many a man with less military aptitude, merely because he had carried a rifle, has become a company officer, to say nothing of filling higher places. The wisdom of that policy is another question.

In these pages men afterward very famous, then young and unknown, cross the path. Cuvier Grover, Simon Buckner, Robert Williams, Eugene Carr, J. E. B. Stuart, John Buford, all subalterns who later became generals of renown, and others of greater rank, as Sedgwick, Harney, Sumner, Van Vliet, Fitz-John Porter, Albert Sidney Johnston, were building character by the inconspicuous discharge of routine duty often interspersed with peril and loaded with responsibility. Charged with practical hints about savages and civilians, mules and wagon trains, troop horses and troopers, this is an important contribution to a phase of American history, the opening of the great plains, whose intelligent record is so inconsiderable. There are occasional errors in proper names, and there is no pretence at literary style; but it is a good book. We make note of it not as essential literature, but as the truthful and unadorned story of a man who in a most modest sphere rendered valuable public service. Every collection of Americana should open for it, and many a library besides.

The Development of Palestine Exploration.

By Frederick Jones Bliss, Ph.D. New York: Charles Scribner's Sons. \$1.50 net.

Both by nature and by art Dr. Bliss is equipped to speak with authority and sympathy on the subject of Syrian and Palestinian exploration. He is a quasi-Syrian, son of one president of the Syrian Protestant college at Beirut and brother of another; and he has spent much of his life in Palestine and its immediate vicinity. For about ten years, from 1890 to 1900, he was in the employ of the Palestine Exploration Fund, directing excavations at Lachish, Jerusalem, Gath, Maresha, and else-

where, and he is the author of various volumes published by the Palestine Exploration Fund recounting these excavations. Before this he had already become known by his investigation of a curious survival of the Syrian language at Ma'lula and by other papers of interest to Semitic and Oriental scholars. It was natural and fitting that his *alma mater*, Union Theological Seminary, should select him to deliver the Ely Lectures in 1903, and that he should select as his subject the theme of Palestinian exploration.

The literature of Palestinian travel and exploration is enormous. Röhrich, in his "Bibliotheca Geographica Palæstina," counts 3,515 names of writers on the Holy Land between 333 and 1878 A. D.; and if one add to this the references for the preceding and succeeding periods, the total number of entries will approximate if not exceed 3,600. The latter years especially have witnessed a most minute search of archives and libraries for any manuscripts or works dealing with Palestine. Röhrich himself has been engaged in the publication of German pilgrimages, and several pilgrim narratives have lately been printed in the quarterly of the Deutscher Palæstina-Verein. Connected with the English Palestine Exploration Fund there is also a pilgrim publication account, while in France the Société de l'Orient Latin is engaged in the collection and publication of similar texts. Dr. Bliss has selected only the more important and characteristic publications from various periods. Precisely how many are referred to in this volume one can tell only by actual count, since there is no special index for that purpose. He has endeavored to arrange them in such a way as to show some sort of a development, but it must be frankly said that, except for the latter time, there is no real development in the series.

The first chapter deals with the topographical and geographical references of the Old Testament, the notices of Palestine in Egyptian and Assyrian literature, in Greek and Roman historians and geographers, including Josephus, and in the Talmud. Then we pass on to the age of pilgrimage, which carries us down beyond the Christian period and up to the close of the eleventh century; and after that to the Crusades, for which period Dr. Bliss has confined himself to Christian writers, to the exclusion of the Arabic sources. With the Dominican monk, Felix Fabre, toward the end of the fifteenth century, begins a sort of pre-modern period, which extends in Dr. Bliss's scheme to the year 1838. Here we have an odd miscellany of ignorant pilgrim narratives and archæological, botanical, meteorological, and, in general, scientific writings, none of which are of importance to-day, except as showing the general conditions of the country at that period and the Christian attitude of mind toward the Holy Land. The real exploration of Palestine begins with the American, Dr. Robinson, and indeed it is astonishing how large a part Americans have played in the exploration of Palestine in proportion to the material means at the disposal of the explorers. It was the United States which, through Lieut. Lynch, gave us the first scientific exploration of the Jordan and the Dead Sea. It was an American, Thomson, who first stirred the interest of

Bible students the world over in the manners and life of the present inhabitants of Palestine and Syria as illustrative of Bible times and Bible customs; and it was Dr. Bliss, an American in the employ of an English society, who first conducted systematic excavations in Palestine.

It was becoming that, in lectures delivered at the Union Theological Seminary, in which Edward Robinson was so long a professor, Dr. Bliss should lay special stress on his importance in the history of Palestinian exploration; but he has no whit exaggerated that importance, nor was one lecture devoted to the subject of Robinson too much. It is astonishing what that man accomplished in the five months which covered his two journeys in Palestine in 1838 and 1852; and his account of those journeys is still a classic for the student of Palestinian geography and history. While deeply imbued with the religious spirit, Robinson broke loose from the trammels of tradition and applied scientific methods to the determination of localities. Simple as his method seems to us of to-day, it was a revelation at the time. His work aroused enormous interest in England and Germany, as well as in America, one result of which was the formation of the Palestine Exploration Fund, with its short-lived sister in this country, and a little later the Deutscher Palæstina Verein. These permanent organizations, especially the English Palestine Exploration Fund, have mapped practically the whole country, collected folklore and local traditions, and, from the study of topographical notices in the Bible and elsewhere, in connection with modern traditions and local place-names, identified by far the larger part of the Biblical sites. Latterly, they have begun systematic excavations. Out of this work, also, have been developed the French, American, and German (to mention them in their chronological order) schools for archæological and Biblical research and instruction established in Jerusalem itself.

One of the singular episodes of Palestinian exploration, to which Dr. Bliss devotes a chapter, is the expedition of the French Government under Renan, who conducted excavations on the Phœnician coast. This expedition was coincident with the French intervention in the Lebanon, occasioned by the Druse massacres in 1860, and the French fleet and French soldiers were placed at the disposal of the explorer. No explorer had greater opportunities than Renan, but, with all his ability in other directions, he had not the gifts or the training requisite for archæological exploration, and one can only say that, in view of the opportunities at his disposal, the *Expédition de Phénicie* was not a success. Far more important to the world at large was the impetus which this expedition and the opportunity of visiting the Holy Land gave to Renan's Biblical studies. Without it the world would never have known his "Vie de Jésus," which, whatever else may be said of it, is one of the most wonderful pictures of the scenery of Galilee ever painted, and one of the most sympathetic studies of the man Jesus ever written.

In his final chapter, Dr. Bliss speaks of the exploration of the future, but with no very great definiteness. Commenting on the Turkish law of antiquities, he says:

"Petty and illicit excavation is easy, while scientific excavation on a large scale is hampered by the tedious but necessary process of obtaining a permit." It might have been added that the law and its maladministration combined have discouraged and almost prevented scientific exploration; and in the meantime incalculable injury has been done through all Palestine by the indiscriminate opening of graves by the natives and the ransacking of supposed ancient sites to procure objects for sale to antiquity dealers and tourists. Dr. Bliss is most cautious in his prophecy as to the probable results of future excavations. He expects "a continuation in the future of the experiences of the past—a gradual aggregation of small things from which large inferences may be drawn, rather than some sudden and startling revelation on a grand scale"; but he admits that the surprises of the past have been of such a character that, in view of the very small amount of scientific excavation conducted in Palestine, it is impossible to forecast what the results of such excavation will be when sites of importance shall have been excavated.

This little volume is not a general account of explorations and discoveries in Palestine, with a summing up of results attained and a discussion of methods to be employed, but rather a partial bibliography of Palestinian exploration, with more or less extended comment—a sort of *catalogue raisonné*. It is extremely difficult to make a catalogue interesting, and it seems to us a matter of regret that Dr. Bliss did not prefer a more pictorial presentation of results, either choosing one or two representative writers from each period and letting them tell their story, or telling it for them in his own words, or else giving us such a summary of the writings of each period as should enable us to see what was the condition of the country at successive epochs. As it is, his work is neither a complete bibliography, with such notes as will enable a student to select what he wants for study, nor, on the other hand, is it a narrative of exploration. It falls midway between.

Some Ethical Gains through Legislation.

By Florence Kelley, General Secretary of the National Consumers' League. New York: The Macmillan Co. \$1.25 net.

As a summary of what has already been accomplished in certain lines of social betterment, and a helpful guide toward promising avenues of fruitful effort in the future, we have seen nothing superior to Miss Kelley's well-written volume, the latest addition to the "Citizen's Library of Economics, Politics, and Sociology." Miss Kelley's preparation for treating such a subject has been direct and practical. As special agent for the Bureau of Labor Statistics of Illinois, she made a thorough investigation of the needle-trades in the tenements of Chicago, in 1892. Subsequently, she held for four years the position of chief inspector of factories of Illinois. She was in charge of the Chicago division of the investigation of "the Slums of Great Cities" conducted by the United States Department of Labor, and for years she has been steadily engaged in "settlement work," first as a resident of Hull House in Chicago, and af-

terwards at the Nurses' Settlement in New York. To her work in all these relations she has brought not merely unflinching energy and an ardent desire to do good, but the less common virtues of trained intelligence and cool judgment as well.

Her most interesting chapters take up what she has well called "the right to childhood." If the functions of mature life are forced upon the child, through any cause whatever, the normal development which should attend this plastic period is impossible; and not only is the child robbed of its birthright to the full use of all its faculties, but society itself is poorer by the loss of what those faculties might have achieved, even if the child does not finally become a positive burden by proving incapable of self-support. The child is *ipso facto* incapable of appreciating the significance of childhood and maintaining its rights therein. The impossibility of depending upon parents to solve the problem is shown by the very fact that the problem exists. Philanthropic interest *applied directly* touches only individual cases. The State, through its general legislative power, is the one agent which can enter the field with any hope of success, and its sufficient warrant for doing so lies in its admitted guardianship of the health and good order of the community, and in its ultimate dependence for its own life and usefulness upon the production of the highest possible average of morals and intelligence in its citizens.

Miss Kelley shows that great progress has already been made in forbidding the employment of young children in labor sure to be detrimental to their development; New York and Illinois taking a decided lead in this work. She brings out clearly and conclusively the baselessness of the supposition, sometimes put forward through honest ignorance of the facts, but perhaps oftener the hypocritical claim of parties financially interested in the perpetuation of child labor, that such prohibition will bring suffering upon dependent parents and relatives, or lack of proper food and clothing to the children themselves. That the earnings of children sometimes go to just such ends is of course true, but investigation has shown that the cases are far more numerous in which the fact of these earnings has been made the basis for a life of idleness and vice on the part of able-bodied men and women. In any case, however, will a self-respecting people, once fully alive to the facts, consent that the burden of maintaining others incapable of self-support should be thrown upon mere children? Miss Kelley hails with great pleasure the growing tendency to put legal restraint upon the employment of young boys and girls in street occupations, such as the selling of newspapers, flowers, etc., and the telegraph and messenger service. Society can well afford, she thinks, to take care of all cases of real destitution supposed to be relieved by such employment, rather than to face the future cost of the crime and pauperism sure to be engendered by subjecting little boys and girls to the immoral influences inseparable from it. She cites two striking answers to the question, what is to become of boys and girls when suddenly thrown out of remunerative occupation by restrictive laws such as she advocates. When child labor was driven by law from the

glassworks of Millville, N. J., a new school house had to be erected immediately to provide for the increased attendance; and the similar law passed by Illinois in 1893 forced the building of one new school house and the opening of an old one long out of use, by driving child labor from the Alton glassworks, previously one of the worst centres of all the evils inherent in the employment of children in manufacturing industries. In some States there has been a tendency to couple such legislation with exceptions in case of the children of widows, or other classes based upon some such plausible peculiarity; but investigation shows that the exception works more hardships than it averts, since it always sacrifices the interests of the child, and by no means always relieves real destitution. An indirect gain of this legislation, not thought of when it was originally proposed, is its restrictive effect on immigration. It has caused an already perceptible shrinkage in the stream of "half-grown, illiterate children brought into the congested manufacturing centres by sordid relatives for the express purpose of crowding into factories and sweatshops."

Compulsory education laws are, of course, to be classed with direct restrictions on child employment, each demanding the supplement of the other in order to work the desired effect. Miss Kelley lays down as the minimum requirement for an effective child-labor law that it should prohibit the employment of all children under fourteen years, of all under sixteen who do not measure at least sixty inches in height and weigh eighty pounds; of all under sixteen who cannot read fluently and write legibly simple sentences in the English language, of all under sixteen between the hours of 7 P. M. and 7 A. M., or longer than eight hours in any twenty-four, or longer than forty-eight hours in any week, and of all under sixteen in any occupation dangerous to life, limb, health, or morals. Of course, such danger is sometimes hard to prove in court; but the steady efforts of philanthropists like Miss Kelley are gradually bringing about a state of public feeling, under the influence of which such doubts will be resolved in the interest of the life, limb, health, or morals of the child, rather than the financial interest of the would-be employer. Effective legislation, she continues, must require the child who accepts employment to satisfy a competent officer that it is in good health, that it does not fall within any of the prohibitions before enumerated, and that it has attended school a full school year during the twelve months immediately preceding. The law must also put upon the parent the obligation of keeping the child in school, and of furnishing to the constituted authorities, before the child accepts employment, adequate evidence as to its age and schooling. For the employer, too, she lays down a list of requirements, very carefully thought out, and so brief, clear, and comprehensive that one is tempted to find in this passage itself the strongest possible support of her argument elsewhere, that women should be admitted to direct participation in the processes of government.

Her second general topic she entitles "the right to leisure." All legislation limiting the hours of labor without reference to age or sex, of course, falls under this

head. She is an earnest advocate of the eight-hour system, believing that the limit is not low enough to impair the efficiency of labor, and that such a limit tends to produce steadier employment, and to enhance the moral and physical well-being of the laborer. To the argument that this and other such legislation impair the right of free contract on the part of the laborer, her answer is that this alleged right is a delusion, because the laborer, from the nature of the case, cannot meet the employer on equal terms, and will often feel obliged to consent to hours or other conditions entirely repugnant to his own judgment and feeling rather than run the risk of being thrown out of employment. He does not thank society, then, for refusing to create for him a legal right to a certain amount of leisure, enforceable without bringing him into conflict with his employer, and thus endangering his tenure of his job, on the plea that this would infringe upon a right of which he finds himself unable to make any satisfactory use in any case of conflict. Doubtless questions will arise here in the minds of many who can follow Miss Kelley without hesitation in all that she advocates for the legislative protection of children, since children have neither the power to help themselves nor the maturity of judgment to recognize many of the most serious injuries which may be inflicted upon them. Her facts and arguments, however, are such as no student of the problems involved can afford to neglect.

The New Earth. By W. S. Harwood. New York: The Macmillan Co. 1906. \$1.75 net.

This short title on the cover is a little too sensational for so useful a book. It does not matter whether the name was meant to catch the eye of those who have in mind the Scriptural association of the new heavens and the new earth, or the smaller class, belonging to the Tolstoy school, who have considered chiefly a new ownership of our present earth. The book has a far more modest aim than to attempt the task of revealing these mysteries, namely, "a recital of the triumphs of modern agriculture in America." It would not bring harm to any of the theologians or reformers to study this recital of triumphs, for even the most pessimistic would come to feel that sure steps are now being taken towards making this a better world.

The volume has a certain scrappiness here and there, as if the chapters had first been used in magazines, but, on the whole, it is consistent and compact. Probably, too, if a second edition is called for, some of the "fine writing" may be advantageously toned down; but the whole movement is brisk from start to finish and the pages are readable throughout. The author has a happy knack of selecting from the solid mass of agricultural statistics the striking facts which would, in a yellow journal, make uncommonly good "scare" headlines. For instance: "The particles in a single cubic foot of average farm-soil for general use, usually roundish in shape, expose to the roots of plants an area of surface three acres in extent. To show

how very small these particles are, it should be noted that fully one-half of the cubic foot of soil is air-space, so that if it were not for the air it would contain twice as many particles." Again: "One investigator, noting the size of the bacteria that appear in milk, says that if they could be increased to the size of baseballs, and a man should be increased in the same proportion, he would stand over fifty miles high." All of which is true. Now, out of the immense accumulations of data in modern agriculture the author has chosen such facts as these and put them in a novel form.

Mr. Harwood begins by contrasting the old farming, cheerless in most of its aspects and crushed by depressing mortgages, with the well-stocked acres belonging to modern scientific agriculture, its books, its music, and the balance in the bank. "The period of the New Earth is more than a renaissance, a revival; it is an era of creation, the most remarkable in history." Under the heading, the "Brain of the Earth," the author deals with the composition and physical properties of soils, as introductory to "Soil-inoculation" by bacteria. Having disposed of the subject of a new soil for plants, he passes naturally to new plants to fit the soil. Here he takes up the matters connected with the breeding of seeds to produce better plants, and he gives a very good synopsis of the most remarkable achievements in this direction, especially as far as horticultural and agricultural varieties are concerned. Chapters follow on modern forestry and modern dairying, in which the layman will find many surprises. The results obtained by laboratory study of bacteria in milk and the utilization of certain forms in the making of butter and cheese are lightly touched upon, but the grand aggregate is amazing to all who have not kept up with recent progress in this work.

The chapter on animal husbandry is carefully, not to say very cautiously, written. And this may well be:

Perhaps in no other line of modern life has there been displayed during this period so much selfishness and so great a determination on the part of unfair capital to take advantage of the necessities of the people; and yet those who provide the supply for the demand, however greatly misused they have been, have not allowed this selfishness to prevent them from advancing.

After this comes an interesting section devoted to the reclamation of the desert lands of the Far Southwest by irrigation and by the introduction of nutritive plants from other climates. Finally, the author discusses the food supply of the world and the benefits of cooperative industry. He shows the importance of the work now, in hand by the Department of Agriculture and its associated experiment-stations, and one can say that there is no exaggeration in the astonishing assertions. Until one examines the whole ground carefully, it is impossible to see why the Department of Agriculture annually comes before Congress as a solicitant of favors; it has the right to demand adequate support. This support it does not have, because its work often runs counter to the organized selfishness of innumerable constituencies. Formerly it was the fashion to ridicule the work of the Agricultural Department as being largely library-farming, and per-

haps parts of the earlier reports were fair game for the humorists of that day. That day has passed. Doctrinaires have been mostly displaced by practical men, who are accomplishing great results. But where they meet the resistance of entrenched selfishness, as has been and is the case in certain forest reservations and in certain *uncertain* foods, it is an uphill fight. Not unfrequently, those who are disturbed by the Department, attempt to make use of the old weapon of ridicule. A perusal of Mr. Harwood's book will show how unjust this ridicule is. The reader will be obliged to admit that the triumphs of American agriculture, during the last few years, have been many and most gratifying, and that a large share of this success is due to the original work in our Department of Agriculture and to its skilful appropriation, with due credit, of work in the same fields of thought throughout the scientific world.

Carlyle and Goethe. By Otto Baumgarten. New York: Lemcke & Buechner.

Few critics who have sought to trace German influence in foreign thought and literature have been on safer ground than Baumgarten, who ascribes much of the Scot's greatness directly to the example and influence of the German immortal, although he sees in the two men of genius the most contradictory types: "Goethe, the clear eye, the bright, sunny look, the susceptibility for cosmos, objectiveness and æsthetic pleasure in Nature, the harmonic moulding of his life as a work of art; Carlyle, the gloomy, veiled eye, the dark glance into the black pits of life, the wrought-out spleen, the violent separation from the wide world, the narrowing to that which to subjectiveness appears heroic, the complete sacrifice of all æsthetic points of view to the ethical, the discordance of his personal as well as his married life." That Goethe stood for a *Mustermann* to Carlyle, the latter's own works have made known: we think of Carlyle doing much to introduce Goethe in England, and of Emerson, leaning on Carlyle, composing his "Goethe, or the Writer," one of the best estimates of the Weimar Olympian ever penned in English. It is not so generally known that a considerable correspondence took place between Carlyle and Goethe, and that an early edition of Carlyle's "Schiller," issued while Goethe still lived, contains an introduction in German from Goethe, and several letters in German between the two authors. Whether this new presentation of Carlyle is pushed too far is likely, at this late day, to be variously regarded, less according to scholarship than to bias of nationality. Baumgarten, taking Froude severely to task for what he believes is an incomplete and partial portraiture of Carlyle, finds more than an ordinary touch of two great souls; to him Carlyle is a pupil of Goethe, turning away from an overdose of Schiller in his youth, absorbing Goethe's *Persönlichkeitsideal*, celebrating Luther, Frederick the Great, and Bismarck as its embodiment, and preaching to his countrymen the wisdom of giving sober thought to their spiritual relation to the Germans. Goethe was to Carlyle even more than Jane Welsh; in his struggles for a *Weltan-*

schaung he found in Goethe his rock and fortress; it was Goethe who led him to the "Eternal Yes." The life-work of Goethe became reflected in Carlyle; "in 'Wilhelm Meister,' especially, Carlyle found a mirror which revealed to him the ground-lines of his own genius"; 'Sartor Resartus' is but an after-effect of Goethean influence; Carlyle's 'Hero Worship' arose from a study of Goethe's ideals as expressed in particular in "Faust"; and in Carlyle's sociological and religious ideas there is astonishing agreement with those of the Spinozan poet. What Baumgarten does not find is the least influence of Carlyle on Goethe!

The Nation.

NEW YORK, THURSDAY, JULY 26, 1906.

The Week.

"Great Father in Heaven," was Speaker Cannon's pious exclamation when, after the conference at Oyster Bay on Monday, he denied that there was any thought of considering tariff revision. The Republicans have decided, then, not only to "stand pat" on the record of the Roosevelt Administration and of Congress, but also on the tariff. From one point of view, this policy is wise; for the most partisan Democrat must admit that Congress accomplished a great deal. On the other hand, the stump-speakers will have hard work to confine themselves wholly to the past and make no promises for the future. This proposed programme of looking backward will have a chilling effect in Massachusetts and in other places where Republicans are uneasy over tariff iniquities. If the Opposition seizes this opportunity to talk about the things concerning which the Republican leaders wish to remain silent, this latest capitulation to the protected interests will make votes for Democratic Congressmen. People are beginning to feel that brute resistance to change has been carried too far; and that "revision by the friends of the tariff" is an idle phrase.

The political programme of the American Federation of Labor, published this week, cannot make the Republicans very happy. They will watch with great uneasiness the progress of the Federation's opposition to the several Republican Congressmen who figure upon its blacklist. Many Republican leaders would, of course, like to speak out frankly, to point out, for instance, the impudence of Samuel Gompers and his associates in assuming to speak in the name of American labor when they represent but one-tenth of the workmen of the country. These Republicans dare not, for they are aware of the weaknesses in their armor. The party which, through its tariff, favors the trusts and is putting hundreds of thousands of dollars into the pockets of the manufacturers it protects, would look foolish indeed in protesting against labor bills on the ground that they are special class legislation. What is needed is a party which will administer the government in the interest of the whole nation, and not of any one set or class. From such an organization the Federation of Labor would have to listen to the plain truth. As it is, influenced by the Parliamentary success of the English labor men, it now

seeks to become a great political power. There is already grave question in England whether the Labor delegation in Parliament can hold together; here the uncharted seas upon which Mr. Gompers and his fellows have set sail are even more difficult to navigate.

Secretary Shaw has handled the Panama Canal loan with much adroitness. When the loan was first authorized, many persons feared that the restrictions would endanger its success. The bonds were to bear only 2 per cent. interest; yet they must be sold at or above par. In view of the strain to which investment capital was being repeatedly subjected, and the much lower prices at which securities of other Governments were being taken, it did not appear easy to satisfy both requirements of the law. The succession of British issues for the Transvaal war during 1900, 1901, and 1902, broke the price of consols from 114 to 86, yet British consols pay 2½ per cent. The offsetting fact, in the case of our own Government bonds, was the artificial demand through compulsory use of them by national banks as security for note circulation and public deposits. But even the banks have not always been eager buyers unless the price were an inducement. Furthermore, there remained the question whether the currency might not hereafter become so glutted with new money as to discourage bank circulation, and whether disappearance of the Government's surplus revenue might not cut down the deposit of Government funds in bank. It was, moreover, evident that individuals were unlikely to bid for an investment bringing an annual return of 1½ to 2 per cent. In order to procure abundant bank subscriptions, the Treasury had, first, to show the banks the necessity of taking the new bonds, in order to enlarge circulation or get increased public deposits, and, second, to assure them that public deposits would be extended. The first purpose Mr. Shaw effected by transferring Government funds to interior banks. These institutions, in order to qualify as depositories, sent to New York to buy United States bonds, and swept the market practically bare of such securities. Then the Secretary announced that one-third of the money paid by any national bank, in subscription for the new loan, would be left in that bank as a public deposit. As a result of these tactics, the entire loan of \$30,000,000 was covered by bids ranging between 103.63 and 104.36. This achievement stands quite by itself among recent operations in public finance; and it is not less noteworthy in the face of a dull and distrustful market.

Less attention seems to be given to the Pan-American Congress, which began its sessions in Rio de Janeiro Monday, than to its predecessors in Washington and Mexico City. This is partly because the first fears and hopes in connection with these conferences have proved groundless. There has been no league of American nations against Europe, as was vaguely dreaded at the first Congress, fifteen years ago. Nor, on the other hand, has there been that marked improvement of commercial and diplomatic relations which generous spirits hoped for. Thus the work and scope of the Congress have come to be discounted as pretty surely perfunctory. Still, Secretary Root may be able to accomplish something. He is eminently a man of business, and it will be interesting to see how he fares with the expansiveness, the politeness, the flowery speech, yet the indefiniteness and dilatoriness of the delegates from Spanish America. In one respect, Mr. Root's long voyage can scarcely fail of result. Both at Rio and in his further travels he will have an inviting opportunity to express the good will of the United States towards the countries to the south of us, and also our desire to secure their good will in return. This policy is known to be near the Secretary's heart, and he should be able to further it while away.

Secretary Root's plan for shifting our secretaries of embassy and legation from time to time will commend itself to all save a few of those secretaries who have "soft" berths. That the diplomatic service will profit thereby is obvious; the wider the experience, the greater the usefulness of the official. There will still remain at the various legations the permanent clerical staff, conversant with the local methods of procedure and formalities, to act as advisers when new secretaries arrive, just as in the past. Moreover, the shifting of diplomats, besides increasing their versatility, invariably results in adding to their linguistic attainments. While French is still the diplomatic language, the representative who speaks the tongue of the country to which he is assigned is, in Europe at least, in a much more favorable situation than one who does not. To this change as to the others there must be the corollary of permanent service under the Government. Well qualified men can be found to endure tedious exile if they can be certain that, after giving years to the country's service, they will not be flung aside for no reason whatever.

The Philippine Government is hopeful again; it has succeeded, thanks to a

skilful subordinate, in bringing about the surrender of the leading "ladrones" in Luzon. Incidentally, it appears for the first time that these "ladrones" were unique among thieves, in that they had formed a political organization, styled the Government of the Filipino Republic, with a president and vice-president, generals, etc. Until this surrender, the public had no idea so many formidable robbers were in the field. Even after this achievement, however, peace is not yet established in Luzon, for "Felipe Salvador and his fanatical followers" are still outstanding. In Cebu all the remaining outlaws have been brought in, together with their guns. But in Samar the attitude of the Pulajanes promises more trouble. A correspondent of the *Army and Navy Journal* says that the problem of suppressing these outlaws, without punishing the innocent, "is a puzzle not easily solved, and up to the present has baffled the most careful and deep-thinking men." The topography of the island makes it almost impossible for the troops to run the offenders down, as there are no roads, few trails, while the tall cogon grass enables the pursued to hide with the greatest ease. The Twenty-first Infantry, which is stationed there, is kept in the field steadily, but as yet with slight results. The peaceful inhabitants of the towns are represented as suffering terribly from the raids of these Pulajanes, who mutilate and torture right and left.

If justification were still required of the laws reforming insurance passed by the last Legislature, it could be found in the present condition of the insurance business and the attitude of the big companies. The figures of the 1905 report of the New York State Superintendent of Insurance, just published, show that the decrease in insurance written was no less than \$151,724,854, the various companies falling behind their previous year's record by 83,376 policies. There were also 76,934 more policies terminated in 1905 than in 1904, which proves that thousands of men and women were content to pocket losses rather than remain connected with companies whose management was under suspicion. In such a juncture the gravest problem is to restore public confidence. For this purpose the provision of the statute entitling every policyholder of a year's standing to vote directly for trustees, is wise and salutary. The only question is whether the policyholders will actually succeed in exercising that power. The New York Life, as we have noted, has shown some realization of the situation by nominating a ticket that at least commands respect. The management of the Mutual, however, seems incurably obtuse or worse. If through defects in its list of policy-

holders filed at Albany, or through other tricks, the Peabody administration, with the backing of H. H. Rogers, thwarts the action of the policyholders, people will continue to desert it for more conservative companies.

Russell Sage had been, for more than a generation, a target of ridicule from the whole country. If he had any aspirations beyond money-getting, he did not show them to the world; any virtue beyond thrift, he did not practise it before the eyes of men. He even failed to enlist sympathy by succumbing to redeeming vices. To most people his name meant nothing but a hand to grasp and a safe to hold. Possibly he did not deserve so much opprobrium; perhaps in some corner of his heart he kept a place for generous dreams and hopes. He may have had visions of splendid charities—schools, museums, libraries, and hospitals, founded by his millions and perpetuating his name for grateful posterity. But though he had it in his power to make the visions realities within his lifetime, he never for an instant loosened his clutch on his dollars. We must form our opinions of him on the facts as they appear. Every village has its keen money-lender, ready to screw the last cent from his neighbors, on mortgage or note. Russell Sage was this village skin-flint writ large. He operated in the market of the continent; but the magnitude of the enterprises in which he shared did not expand his soul or quicken his sense of responsibility to the community. From the individual in his grip he relentlessly exacted the pound of flesh; and he never made even a pretence of reparation in the form of public benefactions. He wanted money; he got it; he kept it. It may be well then that by a rough justice he was made the victim of squib and cartoon; for he was far from the type of an ideal citizen.

The University of Virginia has issued a statement of its growth which will delight its alumni and all interested in seeing education prosper south of Mason and Dixon's line. Primarily, its productive endowment has recently been increased forty-eight per cent., and the annual grant from the State of Virginia fifty per cent. The total available income has risen from \$161,978.49 in 1904-05 to \$196,539 in 1906-07, and a very considerable increase may be looked for in the near future, as the Jefferson Memorial Endowment Fund, begun in March, 1905, has passed the \$850,000 mark, and will shortly be completed by the addition of \$150,000 more. The teaching staff has been doubled since 1900 by the addition of nine professors, one associate professor, eight adjunct professors, and thirty-one assis-

tants and instructors. The faculty now numbers ninety-six. In 1906-07 four new professors—of economics, chemistry, pathology, and physiology—will assume their chairs. Since the fee for Virginia academic students has been reduced, the university should have a much larger attendance. The new university commons will provide board at reasonable rates, and may in time become a Memorial Hall similar to Harvard's. Meanwhile, the graduate schools are being steadily enlarged, particularly the medical department, while the law school has just graduated the largest class in its history. In the engineering department the enrolment has grown from fifty-eight to one hundred and eighteen in three years, and the teaching force from thirteen to twenty-three. Thirty-seven States and Territories and five foreign countries were represented by the seven hundred and twenty-eight students registered in all departments of the university this year—the largest number in its history.

One of the best proofs that Yankee ingenuity is something more than an empty boast is found in the accounts which are often published of the formation of companies for out-of-the-way and novel purposes. No longer is it necessary to go to the sewing machine or the Bell telephone, or even the shoe eyelet, for inspiring examples of modest industrial projects that have brought wealth. Consider the Missouri corn-cob. At the recent convention of the Grain Dealers' National Association there were exhibited specimens of a new variety of corn, grown especially for its cobs. This represented the final stage in the development of an interesting minor industry. When an ingenious Missourian conceived the idea of supplying the whole country with cob-pipes, such as the farmers sometimes made for themselves, the corn-cob had no commercial value in the world, except as an inferior sort of fuel. Now the census gravely lists the Missouri corn-cobs—those elsewhere are still considered valueless—as worth annually \$16,550. Cob-pipes were originally made from ordinary ears, but scientific agriculture set about the production of larger cobs, just the opposite of the requirement for the corn itself. The cob is alleged to have been trebled in diameter, and some Missouri farmers are said to realize now nearly as much for the cobs as the kernels. Whatever else may be said of such odd industries as this, it is an excellent thing that so many ingenious and energetic men who might be "playing the stock market" or "pushing" patent medicines and the like, are eagerly trying to make money in ways which, if successful, will add both to their wealth and that of the world.

Alfred Beit evidently sought with Cecil Rhodes to establish the principle that South African millionaires, whether residents or absentees, shall return to that continent a large portion of the wealth they have drawn from it. In the originality of his testament, however, Mr. Beit has surpassed his old friend. This, so far as we are aware, is the first time that any one has sought to endow a railway. Revolutionary as the procedure is, it is admittedly attractive. If this plan had been adopted in the United States from the earliest days of railroading, we should have escaped some of our most trying political problems. A sufficiently endowed railroad would have no trouble about rates, for it could carry everything free or at merely nominal charges. Large shippers would neither demand nor receive rebates, and division superintendents would have no temptation to secure sudden wealth by misuse of official position. Mr. Bryan, we are sure, would withdraw his proposal of ownership by individual States in favor of the endowed railroad; there would be no more angry stockholders to pacify; no more Stock Exchange battles for the control; and the Federal Government could devote itself wholly to the task of restoring foreign confidence in our canned meats. Altogether, the world owes thanks to Mr. Beit, for showing our multi-millionaires a new way to dispose of their surplus.

German losses during the two and a half years' campaign in Southwest Africa are now known exactly from the official statistics. Altogether, 2,342 persons have perished from disease or bullets. The army proper has lost 2,120 men killed and wounded. One thousand soldiers have returned to Germany as invalids, and an equal number is still in the field hospitals. As the troops comprise not much over 15,000 men, this means that for every fifteen soldiers one is disabled by disease. Sixty-three officers and civilian officials, 102 non-commissioned officers, and 462 privates have fallen in battle. Of the 798 wounded, only 40 succumbed to their injuries, which is thought to reflect great credit upon the medical officers. The deaths by disease, 603, prove, however, that Japanese standards are by no means attained. Meanwhile, the losses steadily continue, although the collapse of the rebellion has been announced as often as our conquest of Samar. All Germany is thoroughly sick of the war, the scandals of which are proportionately greater than ours after the war with Spain. Even the army at home is disgusted; and since many time-expired men are left at the front because of the lack of proper transportation, the popular grumbling increases daily, particu-

larly when the taxpayers study the length of the bill they have got to foot.

The *pénétration pacifique* of Morocco by the French continues steadily. In Tangier almost all the shops are in French hands and have French signs. Besides the Comité du Maroc, there are four similar associations, most of which receive aid from the French Government in their efforts at the peaceful conquest of the country. The French language is taught in Moorish and Jewish schools; German and English are seldom heard. The Jews, most of whom speak Spanish, find it easy to master the allied language of France; those Arabs who have dealings with foreigners generally know some French, occasionally a little English. In Tangier there are published daily newspapers in French, Spanish, and Arabic; and a French monthly devoted to music. The Sherif of Wasan, a sort of Mohammedan pope, whose influence extends over all of North Africa, is under French protection, and wears the legion of honor. The ports of Morocco are touched regularly by six French lines, while German steamers call much less frequently and at longer intervals. A correspondent of the *Frankfurter Zeitung* declares, in view of all these facts, that it is only a question of time when Morocco will become a French colony. He does not say "alas," for he is quite willing to let the French "burn their fingers" there. A few decades hence Germany may, he thinks, succeed France in a peaceful way, although he fails to explain how. For the present, the German programme is for Morocco to become "an international colony under the suzerainty of the Sultan, with absolutely open door."

The energy and intelligence of the Japanese are demonstrated afresh by the official statistics just published of ten years of Japanese rule in Formosa. Eleven years ago the coast was infested by pirates, while outlaws and aboriginal tribes made the interior dangerous. The Japanese established their civil government in March, 1896, but did not until 1901 complete the subjugation of the island. In 1896, there were 4,638 Japanese officials, but in 1904, 12,501; the Japanese population increased from 10,584 to 53,365 in the same period. The revenue has increased from \$1,313,330 in 1896-97 to \$11,166,557 in 1904-05. While the railroad mileage is now 230 miles instead of 60, with a passenger traffic of a million and a half, as against a quarter of a million, the freight traffic has grown from 23,337 tons to 350,431. The telephone and telegraph systems are gradually being extended, and the mails are far larger than in 1894. Mean-

while, the educational system has been developed, so that there are now 14 schools for Japanese with 2,552 pupils, and 153 schools for 23,346 native scholars. In addition, a medical school for natives has made a promising beginning. Foreign trade, except with Japan, has hardly varied during the decade. The exports and imports to Japan about balance each other, and are worth together about \$9,500,000. Gold, coal, and sulphur are being mined in greater quantities, and the increase in live stock is very marked. This record of Oriental dealing with Oriental has its lessons for occidental nations which are endeavoring to develop their possessions in the East.

What shall be the attitude of the press of a country in war time? This is a question which is agitating the journalists of England almost as if a war were in sight. A recent conference, called by the Newspaper Society, agreed that legislation should be obtained from Parliament. The editors granted the necessity of some kind of control, were patriotic enough to see that in a national emergency the country is first and the private interests of the press subordinate, and admitted without qualification the value of the Japanese policy of complete secrecy. As to details, however, there is still a considerable difference between the English journalist and the Japanese. Arthur F. Walter of the *London Times* hoped that "the responsible and somewhat invidious office of press censor will never be committed to any man who is not amply qualified by ability, tact, and judgment to discharge it." Here Mr. Walter put his finger on the weakness of a system of censorship. The average military censor is apt to be a bureaucrat, or a soldier without the slightest knowledge of the newspaper business. His training inclines him to be arbitrary and over-cautious, apt to suppress information to which the country rightly is entitled. Hence, there will never be a wholly satisfactory censorship in nations in which public opinion rules. Generals Grant, Sherman, Sheridan, and others have declared that if they had their way no correspondents would be allowed with the armies. Yet Lincoln was ever anxious that correspondents should furnish accurate and full news of what was going on at the front. Only in this way could he retain the support and confidence of the masses—particularly in the hours of darkness and defeat. Object as the military may, in a country with popular government there must always be published plenty of news and gossip. The people are accustomed to it, and will obtain it, for they are the real government.

THE DUMA AND THE CZAR.

It was fearfully irregular for the English Prime Minister to exclaim, "Vive la Duma," in London, on Monday, but, as even his Conservative critics concede, he was only saying "what is in all our hearts." That is really the significance of Sir Henry Campbell-Bannerman's indiscreet cry. He is a great parliamentarian. He is steeped in the methods of popular representation. Hence it could not but be a shock and grief to him to hear of a parliament forcibly dispersed by an autocrat. And he will not be greatly blamed for consulting his feelings rather than his prudence. All that he really did was to give utterance to a sentiment as wide at present as free government. All civilized nations are watching Russia intently. As between the Duma and the Czar—representing government and autocracy—the hopes and fears of Christendom are all with the former. Sir Henry was the impetuous spokesman of millions.

Even the Russian reactionaries who finally screwed up the courage of the weak Nicholas to the sticking point, are aware that the general opinion of the world is strongly against them. Hence their haste in protesting that they do not really intend the destruction of the Duma. There is to be another one. The Czar "firmly" abides by his "unshakable" determination to grant Russia a Constitution and a Legislature. But the protests of members of the present Duma indicate how little such promises are worth. The policy of the Czar, they point out with great force, must be to obtain "a pliable, subservient Parliament"; while if he succeeds in putting down the popular movement, he "will convoke no Parliament at all." Hence the instant need of such a proclamation as the Duma has issued, defying the autocracy, and calling upon the people to agitate and organize and assert their right to rule themselves.

The issue between the Duma and the Czar may be looked at in a narrow, technical way, or broadly. Strictly speaking, Nicholas had a right to dissolve the Duma. That was reserved to him in clause 3 of section i. of the Constitution. But in providing that "the Duma can be dissolved by the Czar before the expiration of five years"—the term of office of its members—such violent action as we have just seen, even if narrowly legal, was not warranted by the natural meaning of the words. On the other hand, the Duma may also point to the letter of the law as justification for its threat to declare invalid any loans that the Government may make without its consent. The Constitution explicitly extended the "competence" of the Duma to "the departmental, ministerial, and national budgets." This, to be sure, is not so

clear an assertion of the power of the purse as the Commons of England made against Charles I., though the technical argument for it would be good. But the contest has gone beyond the actual script of the documents to the inherent merits of the case. What we have, on the one side, is an autocracy setting itself up again as supreme; on the other, popular representation insisting upon its rights. As an alternative to the impending collapse and anarchy, of which the Marshals of Nobility warned the Czar last summer, he chose the Duma; now, in dispersing it, he virtually challenges a repetition of that industrial paralysis and social chaos which forced from him the promise of a Constitution. If the people say that they have no other weapon but resistance, it is the Czar who has forced it into their hands.

The Czar has, it is clear, staked everything on the army. He expects resentment. He looks for riots. Even armed resistance here and there he must count upon, but if the army obeys orders, he can make a desolation and call it peace. Thus the loyalty of the troops may prove to be the critical factor in the whole struggle. On that point we have not much light. So far as it reaches, however, it makes the prospect for the military autocrats highly dubious. When the soldiers were still in Manchuria, they often manifested a spirit of mutiny. There were many cases of refusal to obey orders, and of officers being shot by their own men. But this, Gen. Treppoff has explained, was due solely to the fact that the officers were not on good terms, personally, with the troops. He declares that not a single instance of insubordination occurred in the cavalry, where better conditions prevailed. However that may be, we have already considerable evidence that the army does not consider itself a machine apart from the nation. A letter from non-commissioned officers in South Russia was published in St. Petersburg Monday, saying:

The time is very near when the Government will find that the army is not on its side. The army is not the same since that sad war. We know now for whom we are bearing all the misery and ignorance in which we exist. Let the Ministers of War, Justice, and the Interior know that we soldiers are now a conscious element of the nation and share its sorrows and its hopes. Better that the officers do not now order us to fire on our families.

In the nature of the case, the Russian soldiers cannot continue aloof from the mass of the people. The force is all the while recruited from the people. Every year, about 300,000 young men, on reaching the age of twenty-one, are taken for service in the army or the fleet. Their period of service is from three to five years. Hence, of the regular army of 1,000,000 men, something like two-fifths has recently come from among those

very peasants and artisans where the spirit of revolution has been most rife. Inevitably, then, the army should be infected. We may not at once see the troops, like the French National Guard, fraternizing with the people; but there is good reason to believe that the army cannot be depended upon to shut its eyes and fire upon Russians rising to demand the fulfilment of the Czar's solemn pledges.

The development of the situation may be slow, but, in the end, the two irreconcilable forces of absolutism and freedom will be in collision. M. Anatole Leroy-Beaulieu, a great and sober authority on Russia, declares that the autocracy has already gone, assert itself galvanically though it may; and that the question is whether the dynasty will not also have to go. We cannot say too roundly that revolutions never go backward. What Napoleon did with the French Revolution, reminds us of the possibility of a military dictator in Russia. But Napoleon held himself in power only by foreign wars, with their *gloire* and loot. Such a means of keeping the Russian army content is grotesquely impossible. All the bloodshed will be at home. Cruel repression may grow from a habit to a passion and then a madness; but, in due time, the irrepressible demands of the Russian millions, who have been taught at last to aspire, will brush away all opposition. It may then be "à bas le Tsar," but it certainly will be "Vive la Duma!"

TRADE UNION VIOLENCE.

The murder committed in the Plaza Hotel building in this city, by members of the Housesmiths' Union, has enabled a coroner to surpass the chartered absurdities of his office. Coroner Acrittelli declares that the posting of special officers where union and non-union men were working near each other was equivalent to incitement of the union men to murder. "The construction company," he affirms, "knew full well that to place a guard over the ironworkers would be like flaunting a red blanket in the face of a bull." It would "almost certainly lead to strife." This learned opinion would make policemen accessories before the fact to every trade-union crime committed where they are in sight. But the inflammability of the union workers goes further than that. It is well known that they feel an irresistible impulse to club and kick a non-union laborer. Yet if you station guards to protect him from violence, you simply stir up murderous passions against those officers, and make yourself responsible for their death. So much for this latest sample of "crown's law."

The whole episode throws new light upon our peculiar problems of trade unionism. Deny it as they may, intim-

idation, brutal assault, and if need be, murder, are widely employed by labor unions in this country. This fact it is which gives them so malign a distinction. Violence is not so the mark of labor agitation in other lands. Frederick Harrison, in a lecture the other day before the International Institute of Sociology in London, stated that in England, though there had been endless strikes, on a vast scale, no violence had been used, except in one or two local and trifling affairs. The reason for this good order, Mr. Harrison found in "the national character of patience and self-control," together with free institutions and a law-abiding spirit; and also in what he called a "real spiritual power" influencing both employers and the masses of laboring men. Our difference from Englishmen, in this respect, has often been noted. It goes to the conduct of mobs as well as unionists on strike. The English mob is uproarious, but not murderous; ours takes with dangerous facility to the throwing of bombs. This necessarily compels a different attitude on the part of the authorities.

The contrast was well brought out by Kipling in his "From Sea to Sea." He first came to this country when the crimes of the Chicago anarchists were still reverberating, and he could not understand the talk he heard about the need of the sternest measures with rioters. On shipboard the conversation fell upon the subject. An American passenger said:

"You can't persuade the mob of any country to become decent citizens. If they misbehave themselves, shoot them. I saw the bombs thrown at Chicago, when our police were blown to bits. I saw the banners in the procession that threw the bombs. All the mottoes on them were German. The men were aliens in our midst, and they were shot down like dogs. I've been in labor riots, and seen the militia go through a crowd like a finger through tissue paper."

"I was in the riots at New Orleans," said the man from Louisiana. "We turned the Gatling on the other crowd, and they were sick."

"Whew! I wonder what would have happened if a Gatling had been used when the West End riots were in full swing," said an Englishman. "If a single rioter were killed in an English town by the police, the chances are that the policeman would have to stand his trial for murder and the Ministry of the day go out."

In point with the last statement is the fact that Mr. Asquith, now Chancellor of the Exchequer, has long suffered, politically, for having, when Home Secretary, approved the action of the troops in firing upon rioting workmen. This is soberly given you in England as a reason why he can never become Prime Minister. This English view is sanctioned by long tradition. As far back as 1780 Burke set it forth in pleas of clemency for the "No Popery" rioters. Burke argued that the offenders were "a poor, thoughtless set of creatures, very little aware of the nature" of their wrong-doing. He feared anything that

should "rather resemble a massacre than a sober execution of the laws."

In the United States, however, the popular feeling is not the same. It may fairly be argued that there is something in our air or blood that makes the resort to violence easy, and that laboring men on strike act only as does the typical American crowd in a fury. If that is an explanation of the cause, it leaves us as much as before in want of the remedy. And there is no remedy except the absolute maintaining of law and order against either the mob or the trades union. In fact, the putting down of mob violence has come to be almost a popular thing in this country. The day is far past when a Governor of New York could make a mealy-mouthed speech to rioters, and address them as his "friends." Gov. Flower and also Gov. Rusk of Wisconsin showed the more excellent way of laying the rough hand of the State upon disturbers of the peace, whether they call themselves strikers or not; and President Roosevelt's plain-spoken speech in Chicago last year, in support of Mayor Dunne's determination to make the city safe from the violence of strikers, met a response which shows which way the wind is blowing.

But the approved medicine for the mob must also be administered to the labor union when it acts like a mob. Why does no leader of workingmen come out in clear utterance upon this subject? Deprecating remarks have, of course, been made by Mitchell, Gompers, and others, but none of them have trenchantly told workingmen that union violence is a crime against their own cause, as well as against the State, and must be repressed with all severity. When the Typotheta of this city were suing out their injunction, last winter, the judge asked the representatives of the Typographical Union what rules they had against violence by their members. He was told they had none. But in the long run trades unionism cannot prosper by breaking heads; and the sooner its champions find that out, the better for their cause.

SUPPLEMENTING IRRIGATION.

Where one acre in the arid and semi-arid regions has been watered by irrigation, a hundred acres continue to bake under the sun from one rainy season to another, far above the level of any possible ditch. Great upland plateaus in Colorado, Utah, and Idaho can never be watered from storage reservoirs or living streams. Deep wells and pumping are of some value, but when all is done, the most optimistic Westerner is forced to admit that much of "God's country" is, after all, a thirsty land.

While the work of irrigation has been carried ahead with extraordinary energy, considering the difficulty of the en-

gineering problems, people interested in other methods have not been idle. State and Federal forestry, as a means of utilizing the land, has been talked in season and out. To-day, the voice of the "dry farming" expert is making itself heard. He recites the old, depressing statistics: There are 600,000,000 acres of public domain left to settlement. Of this, 70,000,000 acres are quite sterile—rocks and alkali and mountain peaks; 95,000,000 acres are sparsely wooded; not quite such a large area is well wooded and valuable; 70,000,000 acres may be brought to a high state of productiveness by irrigation; and there remain 300,000,000 acres, half of the total area, fit only for grazing. Of course, to this immense area of public land must be added as much more in the hands of private owners. To change the form of the statistical chart, the philosopher of the dry country points out that for 1,200 miles north and south, and 1,300 miles east and west, and embracing four-tenths of the whole territory of the United States, there is sharp need for some sort of moisture-producer. Speaking broadly, farming in this region is a speculation, in which the ordinary farmer fares no better than the ordinary speculator in Wall Street.

H. W. Campbell of Lincoln, Neb., who has been preaching dry farming for some years to the plateau dwellers of the West, has so developed his system as to make it a valuable supplement to the reclamation service. As described by many observers, and summarized in the *Century Magazine* for this month, Mr. Campbell's idea "consists simply in the exercise of intelligence, care, patience, and tireless industry." He is not an alchemist, and has none of the airs of a magician. He has made no such spectacular experiments as have called attention to Luther Burbank's wonderful plant-breeding in California. What he says, in effect, is that rain is not needed in the growing season if the moisture deposited in the soil during the wet months is carefully saved. We do not, however, predict any general immediate success for the Campbell system, because the average farmer is as fond of his ease as the average Trust magnate. He will always prefer irrigation to deep ploughing and frequent cultivation. To him the newspaper advertisement, "Let the Little Wonder do your reaping while you improve your mind," makes a strong appeal. When, however, the wheat-raiser is forced to go to the uplands, he will remember the Campbell creed, and may resort to it for agricultural salvation.

The dry farmer begins his preparation for next year's crop as soon as this year's crop is off the land. He sends his ploughs into the field as the harvester leaves it. A seven-inch furrow is turned, then the ploughed soil

is immediately packed firm by a subsoil harrow, or series of cutting disks. From that time until planting begins every rain that falls calls for a fresh stirring of the soil by an ordinary harrow. Winter is not a season for rest and recreation; it is, rather, the busy season, when moisture enough is stored up to force the crop to maturity. All that Mr. Campbell has been able to say in favor of his toilsome method is that the laborer shall have his reward—the experiment has been continued long enough to show that by this incessant labor the yield can be increased from three to five fold. Where the annual rainfall averages twelve inches—irrespective of the months in which it is deposited—practically all crops can be raised by dry farming. A ten-inch rainfall will produce many special crops, like dwarf Milo maize, Turkestan alfalfa, Kaffir corn, beardless barley, and durum, or macaroni wheat.

Mr. Campbell's pioneer work, the enthusiastic labors of the forestry experts employed by the National Bureau and by various States, and the continuous experimenting in the Government desert laboratories with a view to finding out how the unchanging grim humor of the dry country may be turned to the settler's profit—all these serve to emphasize one point, the wasteful spirit of the West. The forestry commissioner of Minnesota begs for funds to acquire for the State 3,000,000 acres of rocky and sandy land fit for planting with pines. He demonstrates that only 20 per cent. of cut-over pine land reforests itself with pine if left untouched. Thus far, however, the West has been content to gather its quick profit from an immediate use of 80 per cent. of the country's resources and leave the problem of subsisting on the remaining 20 per cent. to the next comers. These husbandmen are now plodding into the dry country in the wake of the spoilers, and to them Mr. Campbell, Gifford Pinchot, Mr. Burbank, and the Arizona experimenters are coming to be as significant figures as Frederick Haynes Newell and the experts of the irrigation service.

HARVARD VS. CAMBRIDGE.

The news that the Harvard crew is to meet the Cambridge eight on the Thames in September will gratify lovers of rowing here and abroad. Not since August 27, 1869, when a Harvard four was beaten by an Oxford crew, has there been a contest between English and American boats save in the Henley races. There climatic conditions and the skill of the Englishmen have resulted in defeat for the Americans on every occasion, except in 1878, when a Columbia four carried off the Visitors' Cup. The time has, therefore, long been ripe for a 'varsity contest over

a longer distance than that at Henley, where racing in successive heats over a difficult course has always been trying for American oarsmen.

Still another reason exists why Americans should welcome the appearance in England of a Harvard crew. Some unpleasant happenings at Henley have cast discredit upon our American sportsmanship. We refer not merely to the poor taste and bad manners which marked the Henley career of a crew from a New York college, but to the disgraceful incident of the Vesper Boat Club of Philadelphia, which represented the United States at last year's Henley regatta. Although entered as amateurs, the members of the Vesper crew, as the National Association of Amateur Oarsmen has proved, accepted money in sums varying from \$50 to \$150, more than the proper expenses of their trans-Atlantic trip. Moreover, several of the Philadelphians perjured themselves when giving to a notary information as to their status and occupations. As a matter of fact, they were not qualified to row under the Henley rules. Naturally, this affair has provoked bitter criticism in England, where such racetrack performances would be impossible in amateur circles; and the suggestion has been seriously made by one of the Henley Stewards that all American entries be henceforth barred. Obviously, a well-behaved Harvard crew could do much to make Englishmen remember that there are gentlemen oarsmen in America, and to renew the pleasant impressions made by Yale's Henley crew in 1896.

From the oarsman's point of view the promised race will have the merit of reopening the old discussion as to the relative value of the English and American styles of rowing. Unfortunately, Harvard this year exemplifies the teachings of a professional coach, Wray, who is to accompany the crew. He will be looked at somewhat askance on the Thames, where only amateurs coach amateurs, and where at least one member of Parliament finds it worth his while to train the crews, not only of his own university, but of its great rival. Regrettable as it is that Harvard in this respect savors of professionalism, there will none the less be interesting points of comparison. Cambridge won this season with a crew which was not up to the standard of its predecessors of 1897 and 1900. The stroke was on the bow side, a "North Country rig," not used since 1876. More significant to Englishmen is the fact that Cambridge rowed in a "sculling style"; indeed, her crew was criticised as being more like the American eights than any English 'varsity hitherto. Her victory was as disconcerting to the old-fashioned English boating experts as was the recent triumph of the Belgians at Henley. The

latter were admittedly strong and well-trained men; according to all traditions, their short, jerky stroke should have defeated them. Instead, they won, and handsomely, although it must be said that the crack Leander crew was not there to measure oars with them.

Writing in the *Fortnightly Review*, Theodore A. Cook, who has watched American crews at Cambridge, Mass., and at Henley, stoutly stands up for the long English style. He thus describes its advantages:

If you could take an English oarsman as he is seated in an eight, just at the start of a stroke, and could tilt up the boat until the bows were straight in the air and the rudder at the bottom of the river, you would then see that the action of his arms and legs almost exactly reproduces the movements of a man who is drawing a cork out of a bottle which he has placed on the floor between his feet. His arms remain straight. His body becomes gradually more upright at the hinge of the hip joints. His legs supply the real thrust as they slowly and strongly straighten out, and the knees go flat. That is why, when an Englishman gets out of a boat after a hard race, he can scarcely walk. But he could probably do almost anything he wanted with his arms. Now the effects of this style are threefold. It uses the strongest propelling muscles in the human frame. It uses every ounce of the weight of the body. It can be rowed when a man is so tired that he can scarcely see the back in front of him. However fatigued you may be, you can throw your weight on to an oar-handle until the whole eight men stop rowing altogether.

In Mr. Cook's opinion, the American coaches (he despises the professional variety, boasting that there has not been one on the Thames in sixty years, and never will be another) neglect the human equation entirely: "They develop a theory and prove it on the bank. They then proceed to train their men's muscles by gymnasiums and tanks, to stand the extra strain which that theory will put upon them." A particular coach's style may be successful against another coach's, but it has never yet succeeded against the English style.

Mr. Cook dwells further on the weaker nerves of the American Henley crews, which have invariably succumbed to eights unable to cover the course nearly so quickly in practice spins. The races discovered the Americans' weak points—the disadvantage of their higher nervous tension, and also the fact that human nature "has an awkward habit of announcing its existence, however often it is pitchforked out of the way by a professional." In brief, the Americans' quick, jerky style has been their handicap. The moment they are passed or pushed hard, they falter; their style "disintegrates more and more, and no amount of pluck can save them." In the proposed four-mile contest there will be an excellent opportunity to see whether these English theories are true only on a short course, or whether, as a result, perhaps, of Rudolph C. Lehmann's visit to Harvard in 1897 and 1898, our American style is not more and

more approximating the traditional long swing of the Thames.

PREACHING AGAINST "SOCIETY."

One of the chief sensations of this year's London season has been the series of sermons on the "smart set" delivered by Father Bernard Vaughan. His pulpit is in the Jesuit's church in Farm Street, Mayfair, and he has preached to packed audiences, for the church is too small to hold the throngs that come in carriages and automobiles. That is an old trick of "society." Fashion often goes where fashion is scourged. And Father Vaughan, who does not appear to have craved notoriety, has addressed himself with great directness to the follies of the hour. Here is an extract from the report of a recent sermon:

If Dives, who was buried in Hell, were to revisit the earth he would most surely have the *entrée* to London's smartest set to-day. He would be literally pelted with invitations. And why not? Dives, so well groomed and turned out, with such a well-lined larder and so well-stocked a cellar, would be the very ideal host to cultivate. He would "do you so well," you would meet the "right people at his place," and you could always bring your "latest friend." Besides, what a good time one would have at his house-parties, where there would be no fear of being bored or dull!

George Russell has recalled the fact that Father Vaughan had a precursor in London about 1870. The Rev. George Wilkinson was then the reigning flagellant of fashionable sinners. He did very much what Father Vaughan has done—laying about him with great vigor, and hitting chiefly at the frivolities and vices of the rich. He had little eloquence, but great sincerity; and the burden of his preaching was, as Mr. Russell recollects it, made up of exhortation in this style: "Don't stay till three at a ball, and then say that you are too delicate for early services." "Eat one dinner a day instead of three, and try to earn that one." "Give up champagne for the season, and what you save on your wine-merchant's bill send to the mission field." "Sell that diamond cross which you carry with you into the sin-polluted atmosphere of the opera; give the proceeds to feed the poor, and wear the only cross—the cross of self-discipline and self-denial." The services of this plain preacher were as crowded by the elegants and notables as have been Father Vaughan's this year.

Mr. Russell's explanation is that "Society loves to be scolded." But this, if it be not intended for a paradox, is too superficial. Doubtless there is, to a certain order of mind, a thrill in feeling that one belongs to a class which is important enough to be preached about in church. It heightens the sense of notoriety, and notoriety is three-fourths of "Society," as Matthew Arnold might have said. As for the clerical "scolding" which Society loves, it is not the

genuine article like Father Vaughan's, but the kind of insincere half-protest, half-admiration, and all envy which some preachers indulge in under the impression that they are giving social sins a terrible raking. We all know those mock John Knoxes of the fashionable world. They exhort their dearly beloved brethren to mortify the flesh, and then angle for invitations to mortify their own—and they usually carry a lot of it—at a good table.

Yet it remains true that when a real prophet arises to castigate the pleasant sins of the luxurious, he gets an echo in their own hearts which is somewhat surprising. How are we to account for it? Partly, it may be, on the theory of penance. To go and hear your own class and your own habits and proclivities denounced, may awaken a sentiment which seems akin to virtue. "Yes," you will say, "we may as well confess that it is so. We are leading too gay lives. It will do us all good to go and hear a saintly man tell us the truth about it." Then, having heard, and with a comfortable feeling that you have somehow repented and reformed by merely being where the good word was preached, you depart and straightway forget what manner of man you saw yourself to be when looking into the mirror of the perfect law.

Deeper than all this, however, is satiety. Nothing bores one like a long course of frivolous pursuit of empty pleasures. Vanity Fair gets horribly out of conceit with itself. In gilded society a certain proportion of people may always be found who are sick to death of it; who know its hollowness; who hate its conventionalities, and to whom all its forced gayety is as the crackling of thorns under a pot. A preacher who could uncover to the foolish rich this sense of satiation which besets them or dogs them through all their round of pleasure-seeking and vain social competitions and jealousies, would appeal to a motive that is stronger than fear of punishment after death. Satiety is the punishment before death. A veteran dramatic critic has implored the clergy to declaim, not at the immoralities of the stage, but at its fearful stupidity and banality, its power to make you, not wicked, but infinitely bored. Similarly, we imagine, it is the satiated exponents and victims of fashion who long for a breath from the Judean hills; and the most effective preaching against Society would consist in a faithful depiction, not of its lust of the eyes and its pride of life, but of its endless vexation and heaviness of spirit. That was the text of the weary King Ecclesiast, "the sad and splendid"; and his sigh, "vanity of vanities," uttered nearly three thousand years ago in the palace at Jerusalem, echoes still in the palaces of London and New York.

THE REMBRANDT TERCENTENARY.

AMSTERDAM, July 16.

Rembrandt reigns in Holland. From the desolate heaths of Drenthe to the limestone hills and caves of Limburg, and from the Bourtanger morass to the Wilhelmina Pier at Scheveningen, his name is on every lip during this week of celebration. It is not the great cities only that display the tricolor bunting. A carefully planned and successful propaganda has distributed albums of cheap copies of Rembrandt's masterpieces throughout every one of the eleven provinces.

I am writing in da Costa Plein, around the corner from the Rosengracht, where stands the last dwelling house of Rembrandt—now duly marked with its mural tablet and gay with flags and orange streamers. The Wester Kerk tower—highest work of man in Amsterdam—rises in view. Under its stone floor rests the dust of the greatest painter of the northern Netherlands. This morning I saw the golden-lettered memorial unveiled before thousands of people. A little to the west, and running out from the church square, is the Bloomgracht, in which the artist bridegroom and his bride Saskia dwelt. Yet, except flags and flowers, nothing in the way of decoration, for a moment approaching the Queen's inauguration in 1898, is to-day visible. It is otherwise—more quietly, appropriately, and with an eye to permanence—that the Dutch will commemorate Rembrandt. They have struck in gold, silver, and bronze, tokens, on which besides dates and words of honor is the palette entwined with oak and laurel. The painter's lineaments are those of ripe age, when his triumphs had been attained; while Royer's colossal statue on the Rembrandt Plein, reared in 1852, represents him in his early manhood. The new monument by the sculptor, Toon Dupuis of The Hague, near Rembrandt's birthplace in Leyden, also shows the mature features, as on the medals. As for the book and print shops, all over the kingdom, they blossom with Rembrandt's portraits and pictures.

In the sheaf of newly written biographies that of Dr. Hofstede de Groot, in eight volumes, leads all in documentary importance and general interest. Yet he told me that since the recent completion of his work, about fifteen new Rembrandts have been brought to light. One of these, "Saskia with the Letter," I saw last week in the Frisian Museum at Leeuwarden, and since that time again at the superb collection assembled at Leyden by the indefatigable biographer. It represents Saskia in happy mood, holding what is perhaps a letter from her lover. The metallic lustres and jewelled effects, so frequent in the artist's pictures, are here strikingly fresh and beautiful. Another brief but vivid narration and literary appreciation is seen in "Rembrandt's Leven en Kunst," by Jan Veth. In addition to serious and critical works for the adult readers, there is a small library of books for the young, which tell of the man, the artist, and his work.

It was interesting to witness the Dutch academic function in honor of Rembrandt. To the *aula* of the Amsterdam University, I made my way on Friday, the 13th, through the Doelen Straat, and

the Kloveniers-Burgwal (of Pilgrim Father associations), into the brick archways lined with book stalls, and thence to the pretty courtyard, rich in greenery and gay with flowers. In the hall, well filled with the élite of Amsterdam, Professor Six, a descendant of the famous burgomaster, made immortal on canvas by Rembrandt, presided. The professors, each in black velvet gown and beretta, with huge white cravat, filed in with the dignitaries of municipality and province. Of the five glorifiers of Rembrandt, who were to receive doctorates *honoris causa*, three were present. They sat on chairs confronting mighty sheets of parchment duly printed in Latin, subscribed by the faculty, and brave with the red and black colors of Amsterdam. Émile Michel, now aged, remained in Paris, and Bode, busy in Berlin, could not come; but Bredius, Jan Vetb, and Hofstede de Groot, listened and received honors. Above the tribune in letters of gold was the name of the Amsterdam's University professor, Dr. Tulp, who still demonstrates from the immortal "Anatomy Lesson" on Rembrandt's canvas.

Passing by the "winged words" of Dutch eloquence in oration and official conference, we go in memory, as we did in reality, to the Senate Room—for refreshment of mind as well as body. From the social reception in this hall of portraits, I went to the city archives fronting the New Market. With the assistance of the keeper, I found and read the original entry in full of Rembrandt's marriage with Saskia, the maid from Friesland; and also the one-line record of the artist's death in poverty. Across from the market space is St. Anthony's Street, running into the Jew's Broad Street, where stands Rembrandt's house, now duly marked with tablet. The painter had not far to walk to portray the dissection directed by Dr. Tulp, for the round, or octagonal, room now given up to documents, was once the famous Anatomical Theatre.

On Saturday, July 14, at Leyden I saw again the haunts of young Rembrandt and the twentieth-century honors beaped upon his memory. The old city was ablaze with red, white, and blue, and the Queen Mother and Prince Consort observed "the politeness of princes," and were in their seats at two P. M. Mesdag, Israels, Blommers, and many other artists were among the dignitaries of the city and the ancient University, and the beauty and fashion of South Holland. The exercises were of the most felicitous order. They included superb floral offerings laid by the various artists' societies on the grassy mound to the honor of the man in bronze. Rembrandt, pencil in hand, looks towards his humble birthplace and his beloved Rhine. To make the scene most deliciously Dutch, the inevitable little dog in Tobit's story, in the normal Dutch painters' pictures, and in the Fatherland's history, as on William the Silent's tomb and statue, was there in several breeds. He trotted in and out and after, lending impudence to the dignity of the occasion. Besides the twenty Rembrandts exhibited in the City Museum, were also specimens of the work of all the Leyden painters of the seventeenth century. After the concerts, kermis in the "Burg," and merrymaking at the students' banquet, the fun ceased about four A. M.

On Sunday, July 15, I was again at Amsterdam. Except for an afternoon opening of pictures to "society," at the Arti et Amicitiae clubhouse on the Rokin, the Dutch kept Sunday pretty well. It was appropriate that night should be chosen for the chief Sabbath-day function. A half million people blocked the avenues to the Rembrandt Plein, into which at ten P. M. filed a procession of men in seventeenth-century garb with flambeaux. The glitter of steel cuirass and morion, the slashed and striped silk, the russet jerkins, the orange sashes and plumed hats, made Rembrandt's time come again. Two hundred artists, women as well as men, marched with the costumed escort. As each guild or society, from all over the kingdom, laid down a floral offering, the blue and white flag of St. Luke signalled for a crash of drums and cymbals. The singing of the large male choir, as at Leyden, was superb.

Monday, July 16, was the real Rembrandt Day, and happily dry and fair. Concerts, with choir and band in many parts of the city, and a great costume procession, with allegorical representations in "floats," with maidens arrayed in brilliant colors and heraldic and mediæval dress, amused the people. The crowning function was at the Rijks Museum at two P. M. In the old Hall of Rembrandt gathered Holland's beauty and manhood to consecrate the new rooms set apart wholly for the works of the master. Russia, England, and the other countries of Europe, as well as the United States, may possess Rembrandts; but Holland has her own son's three or four greatest works. I asked Josef Israels which of these he considered the greatest. "The Staalmeesters [Syndics of the Cloth-Makers' Guild] is the one which has the mark of Rembrandt's handwriting," said he. This is his greatest work. In *De Gids* of this month, Israels has further emphasized this view.

The Prince Consort and the Queen Mother led the honors, for the sovereign Wilhelmina abides in quiet at Het Loo palace. The Prince read his speech—with a slight German accent. After music, the most distinguished auditors first, and then all of us, entered the new cloisters—shall I call them?—in which the "Night Watch" and "Cloth Syndics" are to dwell. The first effect is disappointing. The glory seems too lonely and the plain woodwork of the new and rather small rooms too dark. Yet, he who would study Rembrandt would have his canvas alone. Furthermore, the works of other artists gain by Rembrandt's absence.

Drama and song, with the presence of royalty at the Royal Theatre, in the evening, with free concerts, monster stereopticon shows of Rembrandt's paintings and etchings, searchlight effects and illuminations for the people, closed the third century and opened the fourth of the great painter's fame.

W. E. G.

ARCHÆOLOGICAL PROGRESS AT ROME.

ROME, July 7.

Just at present the excavations in the Forum itself are almost at a standstill. The property at the end of the Via Cavour, covering the north part of the Basilica Æmilia, has, however, been purchased by

the Government, through the continued generosity of Lionel Phillips, and workmen are now engaged in removing the buildings. Commissioner Boni intends to proceed with the excavation of the rest of the Basilica at once, and the work ought to be finished in the course of the coming winter. It is not to be expected that the completion of this excavation will add much to our knowledge of the edifice itself, but it will be interesting to discover whether there was a row of *tabernæ* on its north side, as there was on the south side of the Basilica Julia. It is unfortunate that funds are not in hand to provide for the extension of this excavation around the Temple of Antoninus and Faustina, across the end of the Via in Miranda, as far as the Church of SS. Cosma e Damiano (the so-called *Templum Sacræ Urbis*).

The excavation in the ancient necropolis has reached its limits; in fact that portion that is nearest to the Temple of Faustina has already been covered up again, and it is the intention of the director to cover all the rest after three or four years. The surface of the tufa disintegrates so rapidly, now that it is exposed, and so much pumping is necessary to keep the water out, that Commissioner Boni thinks there will be no good reason for keeping the tombs open beyond the period mentioned. It seems a pity, however, that so interesting a spot should be entirely hidden from view.

The removal of the stones that were piled up against the brick pedestal of the Column of Phocas, on the east and north sides, has brought to light the matrices of part of an inscription cut in the travertine slabs of the pavement. The bronze letters were about forty centimetres high, and the inscription about twelve inches long, running in a direction parallel to the front of the Rostra. It reads "L. Nævius L. . . . nus," without doubt the prætor, L. Nævius Surdinus, whose name occurs on the back of the famous relief that represents Mettius Curtius spurring his horse into the chasm in the Forum. This Nævius was probably prætor during the reign of Augustus. As another inscription, dedicated by another prætor of about the same date, was found here in 1811, it has been conjectured that both belonged to the tribunal of the prætors which stood, as we know, near the Lacus Curtius. Close by, and directly between the Column of Phocas and the Lacus Curtius, is a square foundation of concrete, surrounded by the travertine pavement, which might possibly be the base of such a tribunal. We know that the tribunal itself was made of wood. It has also been suggested that this inscription may relate to a dedication of the pavement itself at some time during the early empire. This portion of the pavement does seem to be older and better laid than most of that now existing. Neither of these explanations is entirely satisfactory, and the inscription simply adds one more to the unsolved problems of the Forum.

Signor Boni has recently come to the conclusion that many of the walls in and around Rome, that have been regarded as brickwork of the first and second century after Christ, are not built of ordinary brick, but of big tiles (*tegulæ*) which were obtained in large quantities from ruins caused by the conflagration in Rome.

These tiles were broken with a hammer, and used in structures like the hemicycles of the Forum of Trajan, and the rear wall of the rectangular part of the Rostra. Of course, if these tiles were taken from other buildings their stamps cannot be used to date the structures in which they are now found.

Much interest has been aroused in Rome by the work that Signor Boni is now doing at the Column of Trajan. Investigation showed that a large excavation had been made under the pedestal of the column during the middle ages, and that a chamber in the pedestal itself had been filled up. This chamber has now been excavated. A small window opens into it on the southwest side, and along the northwest side something has been cut away which Boni thinks may have been a sarcophagus. Almost all the missing fragments of the great marble wreath that forms the base of the columns have been found, and are being replaced. A mould of this wreath is also to be made so that plaster casts may hereafter be procured. The architrave and the inscription are also to be restored.

Under the concrete bed of the pavement of the Forum of Trajan, just east of the column, the pavement of a road has been found, that dates from the early part of the first century after Christ. This road is flanked with the remains of buildings constructed of tiles. The pavement rises slightly, and makes an angle of nineteen degrees with the northwest side of the foundations of the column, by which it is cut. Beneath this pavement, close to the northwest side of the column, is a drain which had been filled up. It is clear that this road and the buildings on it were covered up when the Forum of Trajan was built, but the bottom of the archaeological strata has not yet been reached by the excavations. This discovery seems to disprove effectually the traditional interpretation of that part of the inscription on the base of the column which states that it was erected "ad declarandum quantæ altitudinis mons et locus tantis operibus sit egestus." Evidently, in view of what has been found, a supposed ridge connecting the Quirinal and Capitoline hills could not have been removed to make room for Trajan's Forum, and the valley or depression between the two hills had probably always existed. The language of the inscription has always been puzzling, and now is still more so. Signor Boni suggests that this road may be called the *Clivus Pontinialis*, from the *Porta Fontinialis* in the Servian wall, which certainly was very near this point.

Another name has been added to the list of Roman streets by the discovery of a marble altar dedicated to the Lares Augusti by the officials of the *Vicus Stata Matris*, on the Cælian. The inscription dates from 2 B. C., and gives the names of the consuls of that year, hitherto unknown in the *fasti*. L. Caninius Gallus and C. Tufius Germinus. This also indicates the date of the *lex Tufia Caninia*, relating to the manumission of slaves.

At Ostia about four hundred terra-cotta stamps have been found which represent theatrical and hunting scenes from the celebration of the public games. These were used to stamp the loaves of bread

that were distributed to the people in connection with the public banquets provided during the games. *Mulum* was also distributed with the loaves of bread, and many small measures, containing about three-quarters of a litre, were found with the terra-cotta stamps.

The work of removing the Villa Mills on the Palatine is to be commenced at once, and we may look forward to a renewal of interest in the archaeology of the Palatine.

S. B. P.

Notes.

T. Fisher Unwin, London, has just published an illustrated book of travels, "Vacation Days in Hawaii and Japan," by Charles M. Taylor, and "Women's Work and Wages," by Edward Cadbury, Miss M. Cecile Matheson, and George Shann. This latter book deals with conditions of work, life, recreation, and ameliorative agencies, wages, legislation, home life, recreation, clubs, trade unions, legal minimum wage, and wages boards.

E. P. Dutton & Co. will soon publish "A Woman of Wit and Wisdom," a memoir of Mrs. Elizabeth Carter, one of the "Bas Bleu" Society, a notable scholar, master of many languages, and translator of Epictetus. The work is by Alice C. C. Gaussen, author of "A Later Pepys."

A recent address, "The Service of Missions to Science and Society," by W. W. Keen, M.D., LL.D., of Philadelphia, president of the American Baptist Missionary Union, is being circulated as an inexpensive booklet by the Literature Department of the American Baptist Missionary Union, Boston.

The "Oxford Library of Prose and Poetry" (Henry Frowde) issues "Theological Essays" by the late Benjamin Jowett, and Trelawny's "Recollections of Shelley and Byron." Jowett's essays are selected and arranged by Lewis Campbell; Trelawny is edited by Edward Dowden.

The Clarendon Press has just issued six volumes in its "Higher French Series": Flaubert's "Salammbô," edited by E. Lavrière; Lamartine's "Jocelyn," by Émile Legouis; Madame de Staël's "De l'Allemagne," by Henry Weston Eve; Mémoires de Madame Campan, by H. C. Bradley; Hugo's "Notre-Dame de Paris," by Léon Delbos; and Gautier's "Trois Grotesques," by H. J. Chaytor. Appended to the French text are English notes. The type is rather small but clear; the paper opaque.

The Macmillan Company makes two announcements of special interest to students of the classics. The firm will issue "Historical Greek Coins," by G. F. Hill, of the British Museum. There will be thirteen plates in the volume, besides illustrations in the text. The company has also undertaken a new series of Latin classics, to be prepared, with special consideration for the needs of younger students in colleges, under the editorial supervision of James C. Egbert, professor of Latin in Columbia University. Each volume will contain a brief introduction, the standard text, and a commentary in the simplest and briefest form.

To his text of the "Elegies" of Propertius and his recent "Index Propertianus," J. S. Phillimore has added a prose translation. (Oxford: The Clarendon Press.) The work is designed, we are told, both for the general reader who has no Latin and for the student who wishes to solve the difficulties of the original text. We doubt whether readers of the first class, who have any desire to know Propertius, are sufficiently numerous to justify effort in their behalf, and for any student able to deal with the original at all Mr. Phillimore might easily have provided a more valuable aid than this translation. There is scant justification for translation of such an author as Propertius on any basis which precludes genuine literary merit at the start.

In Eugene Bacha's "Le Génie de Tacite" (Paris: Alcan. New York: Stechert), we have the latest attempt to solve the problem of Tacitus. One critic has not hesitated to call him the greatest historian of all time; to another he is first and foremost a mere stylist, ready even to eliminate an important fact rather than injure the stylistic form of a sentence by its insertion. Still another has found in him a malevolent pamphleteer, employing an almost Satanic verbal ingenuity in whipping the Imperialists of his own time over the shoulders of such noble Romans as Tiberius Caesar. Most of those who actually read Tacitus, however, get a strong impression of a serious and powerful mind, incapable of freedom from bias in the interpretation of facts, but always with an honest endeavor to be fair. To M. Bacha we are indebted for the discovery that these estimates are one and all widely astray. Tacitus wrote neither history straight nor history warped, but pure fiction. M. Fabia's laborious efforts to show where the "Annals" follow Aufidius Bassus, and where Cluvius Rufus, are thus seen to have been thrown away, for the one great "source" all the way through was the writer's own fertile imagination. We cannot reproduce here the ingenious line of circumstantial evidence on which the court of scholarship is asked to pass death sentence upon one of the most persistently readable and influential historical writers of all ages. M. Bacha, like many another rash critic, has set up a theory and allowed his love for it to lead him beyond the bounds of sound judgment. If the "Annals" had contained so large a purely fictitious element they could never have survived the criticism which would have been heaped upon them by the age to which they were first submitted, containing as it did thousands of children and grandchildren of the eminent men and women whose names and deeds appear in the fascinating record.

In connection with the celebration on July 6, by the University of St. Andrews, of the four hundredth anniversary of the birth of George Buchanan, a volume will be published early in August by Henderson & Son, University Press, St. Andrews, and will be entitled "George Buchanan: a Memorial, 1506-1906." It will contain papers on the various aspects of the Scottish scholar's life and work, as well as translations of his verse. An appendix will give an account of the St. Andrews celebration. On that occasion the Lord Rector, Andrew Carnegie, asserted that

Buchanan was not only the greatest poet of his time, and a great scholar, but the founder of constitutional government. It was Buchanan who first in Britain proclaimed the divine right of the people and denounced the divine right of kings. In his commemorative oration Lord Reay dwelt upon his strength of character, independence of judgment, scorn of luxury and fearless assertion of individual convictions. He said that the debt of gratitude which Scotland owed him could best be paid by following in his footsteps. "Had he lived in these days his scathing satire would have been directed against the evils of plutocracy and democracy, and the tyranny of public opinion." He concluded by saying that the universities have no nobler duty than to inspire the rising generations of young Scots to maintain the liberties they owed to him and his friends, and to use them in such a manner as would have satisfied Buchanan that he had not lived in vain.

Daniel Coit Gilman, president of the association formed to honor the memory of Dr. Walter Reed, whose discovery that yellow fever is conveyed by mosquitoes was discussed in the *Nation* last week, writes that \$20,000 has been collected for the fund, and that \$5,000 more is needed. When this sum is received, the income will be paid to the widow of Major Reed, and the capital reserved for a permanent memorial, probably a monument in the city of Washington. Further contributions are greatly desired. They may be sent to the treasurer, Charles J. Bell, of the American Security and Trust Company, Washington, D. C.

The plan for a Keats-Shelley memorial in Rome—to purchase the house in which Keats died, and to establish therein a library of the works of Keats and Shelley, and to provide for perpetual care of the graves of the poets—is making steady headway. Of the total amount needed, \$22,000, about half has already been subscribed. Checks should be made payable "to the order of the Keats-Shelley Memorial Fund," and sent to R. U. Johnson, secretary and acting treasurer, No. 33 East Seventeenth Street, New York.

Some interesting books with autographs have been sold this week by Sotheby in London: a work by John Selden, presentation copy from the author to Ben Jonson, who has written in it his autograph; a pamphlet by Sir John Norris and Sir Francis Drake, "Ephemeris Expeditionis," 1589, with the autograph of Ben Jonson on the title; a copy of Lovelace's "Lucasta," 1649, with the inscription on the fly-leaf, "Charles Cotton ex dono authoris." The sale also included fine illuminated manuscripts, and rare early printed books.

Harper's Magazine for August presents a notable array of contributors: stories by Mark Twain, Thomas A. Janvier, W. D. Howells, Alice Brown, and Joseph Conrad; "The Sense of Newport," by Henry James; and poems by John B. Tabb and Laurence Housman. President Arthur T. Hadley of Yale, in an article entitled "Wealth and Democracy in American Colleges," maintains the comfortable thesis that, after all, the increase of wealth and the spread of luxury are not a serious menace to the democratic spirit in our colleges; and that intercollegiate athletic

contests, in spite of "incidental evils," "form the most potent protection against those minor forms of self-indulgence which are so often a first step in the direction of major evils." Prof. Thomas R. Lounsbury discusses with his usual vivacity and good sense "Hostility to Certain Words," particularly "tireless" and "female." Howard Pyle in the colored frontispiece adds to his series of "Pictures from Thackeray" an admirable representation of Beatrix and Esmond. In *Appleton's Magazine* Miss Agnes Repplier's amusingly suggestive essay on the treatment to which children have been submitted since Miss Edgeworth's day, in the name of education, is the feature of the month. *Scribner's* follows up Chapman's flamingo pictures of last year with some remarkable photographs of the mountain-goat taken on its native crags by W. T. Hornaday, and John M. Phillips. This is its fiction number, a complete novelette by Edith Wharton and one of Arthur Cassett Smith's delicately worked out short stories being the best among its contributions. The *Century* reproduces partly in color the pastel drawings by F. Dormon Robinson, who made them two blocks distant from the heart of the San Francisco fire. "Heroic San Francisco," by Louise Herrick Wall, is the article which they illustrate.

The *National Geographic Magazine* for July is wholly devoted to a series of seventy photographs, taken with flashlight and camera, by the Hon. George Shiras, 3rd, of wild game—deer, elk, moose, herons, duck, pelicans, birds in flight, etc. The brief accompanying text is a description of his methods and a strong advocacy of this hunting with the camera which does not tend to convert the wilderness into an untenanted and silent waste.

Of especial interest at the present time is the paper of Prof. R. S. Tarr of the United States Geological Survey, in the *Geographical Journal* for July, on recent changes of level in Alaska. In it are given the main results of a study made last summer of the general geology and physical geography of one hundred and fifty miles of the coast. The most pronounced evidences of changes of level are well-defined rock benches and associated sea-caves and chasms elevated well above the level of the present reach of the highest waves. A part of this uplift, which amounts in one place to eighteen feet, is due to an earthquake in September, 1899, which lasted for seventeen days. These investigations throw light on the causes of the San Francisco earthquake, showing that it is situated on a danger-line in the earth's crust, and that the normal process of mountain building is active in the coast ranges of California as in Alaska. An account is given by Col. F. R. Maunsell of the Rhodope Balkans, which almost unknown part of the peninsula is interesting from the peculiarities of its inhabitants and its remarkable natural beauty. Sir G. T. Goldie, in his annual presidential address before the Royal Geographical Society on the geographical work of the past year, refers to the return of a young American explorer, Ellsworth Huntington, from Central Asia, where he "has done much to solve some of the problems connected with the geography, the desiccation and the archaeology" of that region.

The second issue of the Sociological Papers published by the British Sociological Society is in many essentials like the first. Francis Galton continues his papers on eugenics, or man-breeding, and here attempts to show that the creation of usages and institutions which shall control the present irrational methods of human mating, is entirely possible. Professor Geddes continues his demonstration of the subject of civics, and Dr. Westermarck contributes one of his characteristic papers, heavily fortified with ethnographical instances, upon magic and social relationships. A brilliant though unconvincing study of the relation of sociology and ethics comes from the pen of Professor Höffding; the philosophy of history is taken up in a somewhat similar way by Mr. Bridges; and Professor Sadler writes ably upon the school as a social factor. The most obscure contribution is by Professor Stuart-Glennie on the classification of the sciences; a sociology which takes in such topics treated in such a way is certainly yet ill-defined in scope. The usual discussions are appended and form, in some ways, the most interesting part of the volume. In general the style of the papers is similar to that of the first series, and subject to the same criticisms.

The remarkable progress of the social reform movement in India is shown by a memorial, signed by 100 prominent Indian gentlemen, calling the attention of the Bombay Government to the prevalence of the custom of dedicating young girls to a life of immorality by marrying them to Hindu gods. The girls are prohibited from contracting another marriage, and are known as Muralis. Though a ruling of the Bombay High Court has made these sacred marriages illegal, they are still notoriously frequent, the memorialists assert, and prosecutions are extremely rare. They suggest that the illegal character of the procedure should be prominently advertised at the various temples, and that the priests should be informed that in permitting the ceremony they make themselves accessories to crime and punishable as such. The memorialists recognize the intimate connection between the propagation of Christianity in India and social reform by asking that the young girls who are rescued from a life of prostitution should be placed in the care of proper guardians or mission orphanages.

"Citizenship and the Schools," by Professor Jeremiah W. Jenks of Cornell University (Henry Holt & Company), comprises a group of addresses and essays prepared for various occasions during a period of fifteen years past, and connected by their common relation to the general subject of education. With one exception the different chapters have all been in print previously or have been delivered before public audiences. The exception, entitled "Free Speech in American Universities," was inspired by the resignation of President Andrews from Brown University in 1897, a case in which the traditional precaution of nine years seclusion has been at a considerable cost in timeliness and force.

In his "Socialism: a Summary and Interpretation of Socialist Principles" (Macmillan), John Spargo, already well known as the author of "The Bitter Cry of the Children," professes only the modest pur-

pose of stating in simple language, and from the point of view of a "convinced socialist," what socialism is and what it is not. The historical survey is both fragmentary and slight, being limited mainly to an account of Owen's life and work, a discussion of the origin of the "Communist Manifesto," and a brief sketch of Marx. For the rest, we have a chapter on the materialistic, or economic, conception of history, the fundamental limitation of which theory the author does not, apparently, perceive; and a well-put analysis and defence of the main positions of Marxian socialism. The statement of the socialist position, while frank and pointed, is in good temper, with a minimum of denunciation of the evils of capitalism, government by injunction, and the like; save, however, in its recognition of difficulties in the way of early realization, the exposition is without novelty. If such affirmations as some of those contained in Mr. Spargo's final chapter, on "The Socialist State," are generally accepted by socialist leaders of the present day, we may at least congratulate ourselves that socialism has somewhat moderated its claims.

The latest addition to the series of "Selections and Documents in Economics," edited by Prof. William Z. Ripley, is a substantial volume of over eight hundred pages, compiled by Prof. Thomas N. Carver, of Harvard, and entitled "Sociology and Social Progress" (Ginn). Like the other volumes in the series, this is intended primarily to serve as a convenient selection of significant extracts to accompany lectures, or supplement a textbook, or form a basis for classroom discussion. Thirty-five pieces, varying in length from two pages to ninety-six, and representing twenty-seven authors, are presented. The writers range from Aristotle to Max Nordau, the list including such contrasted names as Comte, Buckle, Machiavelli, Adam Smith, Mill, Darwin, John Fiske, Macaulay, and Tarde. Professor Carver gives warning that the passages presented do not necessarily embody his own views, and are not to be regarded as "invariably sound and accurate"; the aim has been, rather, to choose extracts which by experience have been found to be "the most instructive, the most stimulating, and the most thought-provoking." The volume does not, accordingly, show us much of its compiler's personal opinions, and can hardly, we think, be of great usefulness to the general reader. Professor Carver's brief introduction, however, is distinctly interesting. To the theory of the "economic interpretation of history," as set forth by Professor Seligman and others, Professor Carver opposes, "as a challenge," the thesis that "every great historical epoch and every variety of social organization must be explained on the basis of factors and forces now at work, and which the student may study at first hand." Sociology, therefore, while using the method of economics, passes beyond the field usually cultivated by the economist, and seeks a theory of social progress through a study of "those factors and forces which govern social phenomena and the relation of cause and effect among them"; while its relation to history may be likened to that between dynamical and historical geology. Professor Carver's position is too briefly

stated to warrant a general judgment upon it, but it has the merit of bringing sociology to a place where the historian and the economist can comprehend its nomenclature and judge its processes.

Le Mounier, Florence, has issued a revision by Giovanni Mestica of the authorized edition of Leopardi's works, both poetry and prose, which was originally published by this house in 1845, eight years after the poet's death. Mestica prepared this text with great care, making use of the original manuscripts. He intended to add full, critical notes, but unfortunately his death prevented the execution of this plan.

"Étude comparée de la Versification Française et de la Versification Anglaise: L'Alexandrin et le Blank Verse" is a thesis for the doctorate at the University of Grenoble, written in French by a Scot, Thomas B. Rudmose-Brown. It is published at Grenoble. Confining itself almost exclusively, as the title indicates, to the consideration of the French Alexandrine and of the so-called decasyllabic line in English, it is necessarily incomplete and inadequate as a comparative study of the prosody of the two languages. Nevertheless, it is a treatise by no means to be ignored by French or English students of versification. Its most Gallic characteristic, after a habit of bluntly calling other authors wrong, is a tendency to substitute assumption for demonstration, and to mistake assertion for proof. Because of this it presents less cogently than might be the author's ideas, some of which are original. The most notable of these appears on page 63: "Rhythm and metre are two distinct entities." Apparently (from pages 8, 65, 66, 176, 184, and others) by "rhythm" is meant prose-rhythm and by "metre" verse-rhythm. This distinction and the conception of the two as coexisting in poetry seem valuable and original.

M. Madelin, who a few years ago produced an excellent work on Fouché, now publishes a thick volume entitled "Rome sous Napoleon" (Plon). The title explains itself, and the book will maintain the author's reputation, though the interest is hardly equal to that of his earlier work.

Dr. Hugo von Tschudi, the director of the Berlin "Nationalgalerie," has put students of German art under obligation by publishing what may be called a monumental illustrated catalogue of the great Menzel exhibition, held at Berlin in the spring of last year. The large quarto volume, entitled "Adolph von Menzel. Abbildungen seiner Gemälde und Studien—Auf Druck von der Kgl. Nationalgalerie im Frühjahr 1905 veranstalteten Ausstellung" (München: Bruckmann), contains, in 661 zinc etchings and 25 photogravures, reproductions of the best of the master's oil paintings and water-color sketches, chronologically arranged, with brief descriptive comments on each individual piece. The impression produced by this condensed conspectus of the life work of the great German realist is truly astounding. One feels at a glance that here there is a man full worthy to be placed by the side of Dürer and Holbein, and one cannot help wondering how it was possible that there should have been a time when his work was overshadowed, in the

public estimation, by the glittering stage effects of a Kaulbach or Piloty. An interesting supplement to this volume is afforded by another publication, also by Dr. von Tschudi, entitled "Aus Menzels jungen Jahren" (Berlin: Grote), largely consisting of reproductions of Menzel's early works and containing some fifty letters of his, written between 1836 and 1853. Here we see the young artist struggling, practically all alone and surrounded by a world of conventionality and platitude, for that mastery of nature and that grasp of every form of the visible which finally, after he had found his hero in Frederick the Great, won for him the position of the greatest artistic interpreter of Prussian character. Dr. von Tschudi's own observations on the peculiarity, the power as well as the limitations, of Menzel's art belong to the best things that have been said about him.

The work of preparing new quarters for the Vatican picture gallery has been going on for some two months, and may be finished by the end of this year. Ever since his accession the present Pope has cherished the design of building a new gallery in the Vatican, over the long wing of the Galleria Lapidaria, both on account of the insecurity of the present gallery, and because this part of the palace is needed for other purposes. It was found, however, that this plan involved too great an expenditure of money and time, and an easier solution of the problem has been found. The new gallery will occupy a part of the long wing on the west side of the Cortile del Belvedere, on the street leading to the entrance of the museum, and opposite the Vatican gardens. Each of the great masterpieces of the present collection—the Transfiguration, the Madonna di Foligno, and the Communion of St. Jerome—will have its own room, and in the new gallery will be placed all the pictures by the old masters that are now scattered in different parts of the palace, besides those in the present collection. No modern pictures will be hung here. It is with something of a shock that we hear that the new gallery is to be equipped with all modern improvements in heating, lighting, and ventilating.

The little book entitled "Our Common Wild Flowers," by Alice M. Dowd (Richard G. Badger), is a reading-book for common schools. It has grown out of the writer's needs as a teacher, and has been prepared with loving care for her own pupils. But it is likely to meet the needs of other teachers who desire to give their students a glimpse of some of the outside relations of plants, and especially the interesting folk-lore. No one must expect to find in this book any key to names of plants or any means of strictly identifying even the round hundred with which the author deals; it is simply to serve as a pleasant introduction to a wider knowledge of certain phases of the life of our common plants. We do not feel quite sure that the writer is a safe guide in matters of teleology, or the doctrine of final causes, if we can take the following extract as an indication (page 19): "Jack" (that is, Jack-in-the-pulpit) "is related also to the skunk-cabbage and to the calla-lily. Both of these plants have the same general plan of flowers that Jack

possesses. They have worked from the same pattern, but one has developed disagreeable traits, *while the other has made itself pure and beautiful.*" Of course, the italics are ours.

Miss A. M. Clerke's "System of the Stars" (London: Adam & Charles Black; New York: The Macmillan Co.) is a second edition; but it has been subjected to such drastic revision, that scarce a page has escaped material modification, and it may be considered as substantially a new production. It first appeared in 1890, when the present system of astronomical observation, which almost revolutionizes the work, had hardly come into use. In 1890 the direct optical observation of the heavens was the rule, and scientific observation of photographs was the exception; while at present, at all the great observatories, it is the photographs that are mainly relied upon in physical astronomy, and direct observation is only resorted to exceptionally. Miss Clerke thoroughly understands the work of observatories, their problems and their methods; but the peculiar merit of her writings lies in the judgment with which she selects the topics which will be the most interesting to the auditory that she addresses. Although the present publication followed soon after her "Problems of Astrophysics" (a book of which a well-worn copy will be found in every observatory), it does not traverse the same ground. The object of the present work is to instruct the general reader, while that of the "Problems" was rather to suggest to astronomers the manner in which the frontier of their advances might best be rectified. Upon one point a note of warning may be sounded. Regarding all those problems toward the solution of which astronomy is advancing by well-settled methods, Miss Clerke's representation of the present state of its siege-operations is in every way admirable; yet on certain questions so much remains doubtful that no definitive answers to them ought now to be attempted. One such question is whether the visible universe occupies but a finite region of infinite space. There are indications which seem to point to such limitation; but sound logic must still counsel a suspension of opinion. Miss Clerke writes as if it were quite certain that we see only to a limited distance. The volume contains beautiful new plates, reproductions of some of the best of the celestial photographs. Of course, they cannot show all that is to be seen upon the originals. The index is excellent.

In "Morgan's Cavalry" (Neale Publishing Company) General Basil W. Duke, who fought under John Morgan, gives some account of various raids in which he took part. His point of view is that of a Kentucky man who went South; and what is of most interest in the volume is the description of the straits to which the Kentucky secession regiments were driven in the last period of the war, especially after the surrender of Lee and Johnston.

—A rivulet as it flows to the sea is lost in a great river, so that to follow its course involves a survey of the mighty flood. That exactly illustrates the History of the Twentieth Massachusetts Volunteers, a matchless regiment of the Second Corps in the Army of the Potomac, as prepared

by Col. George A. Bruce (Boston: Houghton, Mifflin & Co.). Col. Bruce, who, "although serving in the same army, never even saw" the regiment, justifies his selection by its Officers' Association as its historian, by developing an admirable account of the minor organization into a clear and fascinating exposition of the great operations in Virginia in which it took part. The Seven Days, Antietam, Fredericksburg, Chancellorsville, especially Gettysburg, and the long year of attrition that closed at Appomattox, live again. The forceful but unexaggerated accounts of those great conflicts, of why they occurred, and what followed, make a distinctly valuable contribution to military history, useful and interesting to survivors and to non-participating students alike. The experience of the field illuminates where a writer in the closet might fail to see the situation. Thus, after the salient at Spotsylvania was carried, there was no mounted staff to rectify the line disorganized by victory and to lead supports to it, for every officer had necessarily gone in on foot. But the "men on horseback were swiftly flying to various parts of the [Army of Northern Virginia] to bring up fresh and organized troops to meet the greatest danger that had ever yet threatened it" (p. 371). Lights like this flash across the whole story. There is no pretence of describing more than was done by the Second Corps, of which the Twentieth Massachusetts was an organic part, but within that limitation the illustrations are vivid. Examples of such sidelights are the forcing of the Rappahannock and the fight on the right at Fredericksburg, Pickett's repulse at Gettysburg, the negative Mine Run campaign, the operations beyond Deep Bottom, the Ream's Station disaster in August, 1864, and the just eulogy of Warren—who saved the day, perhaps the nation, when the key of Little Round Top was held by the heroic soldier whose genius and courage later preserved the Second Corps at Bristoe and upon whom fell so sad and undeserved a fate when victory was in sight in 1865.

—In all this turmoil the regiment is not lost sight of; it is a constant figure in the kaleidoscope of war. So many of its original officers were recent graduates of Harvard that locally it was known as the Harvard regiment. That the nobility of letters compelled to daring is seen in its bloody distinction of being fifth on the roll of those that suffered the heaviest losses of the war. Fifty-five officers and seven hundred and ten men were killed or wounded in action, and at one time but one officer and ten men were left with the colors. It is not invidious to say that it developed a superb military showing under the leadership of Palfrey, Revere, and Abbott; that, besides losing heavily of its young officers in the earlier campaigns, eleven attained the grade of brevet-general, nor to remind the reader that the thrice-wounded Justice Holmes of the Supreme Court was mustered in at its formation. This volume deserves large folded maps to replace the meagre ones it offers, and it is too valuable to remain, like a novel or a fairy tale, without an index.

—As volume v. of the "Documentary History of the Constitution" (Department of State, Washington) contains an appendix

and a bibliography, it may be assumed to be the final volume. As such it again raises the question of the purpose and performance of the undertaking. Undoubtedly, the "documents" relating to the framing and adoption of the Constitution and its amendments would make an interesting and valuable compilation, and those documents are, for the most part, in the Department of State. But by seeking to include what mention of the instrument was to be found in the various collections of private correspondence on deposit in the Department, the editor changed the nature of the work, and has failed to give even what was fit and proper. It is not a documentary history, because a large part of it is composed of extracts from private letters, and documents play a secondary part. It is not a complete history, because it is confined to material found in the Department of State, other sources being entirely ignored. It is not even a final use of this material; because the extracts, torn from their context, mislead rather than instruct, and the form of publication is awkward, even if an index is to follow. It is to be regretted that so costly an issue was not better considered at the outset, and some of these defects obviated. With certain useful features, the five volumes must take their place among the long list of Government undertakings that have failed to show the qualities that make for permanent value.

Ole Bang, the Norwegian actor, who has been much praised for his interpretation of Ibsen's characters in the vernacular, is to play here in English next winter. He is not altogether unknown in this city, having appeared in "Peer Gynt" in the Manhattan Theatre. His English repertory includes a one-act comedy, "Love by Compulsion," "Peer Gynt," and "The Lady and the Burglar." In this last piece he is to play the heroine. It is doubtful whether experiments of this kind are ever worthy the attention of a serious actor. In the Ibsen piece Agnes Mapes will be Solveig and Miss Talcott the Troll.

The indisputable dramatic power displayed by Miss Margaret Anglin in the interpretation of certain phases of emotional excitement has excited curiosity as to the range of her ability. Hitherto her most successful achievements have been mainly along one line of character, and have left the extent of her versatility a matter of uncertainty. Manifestly if she can play other parts as well as she does those of repentant, agonized, and passionately protesting sinners, her artistic value, already considerable, will be much increased. Her programme for her approaching season at the Princess Theatre has the merit of variety. She will be seen first in a piece by Prof. William Vaughan Moody of Chicago, called "The Great Divide," but apparently identical with "A Sabine Woman," which has already had a provincial trial. The main interest lies in the conflict between two strongly contrasted natures and the eventual triumph of love. Here is the ancient "Ingomar" theme with modern variations. Next Miss Anglin will produce "The Eternal Feminine," a romance of antiquity, in which she will be seen as an Amazonian queen; and this will be followed by a revival of "Mrs. Dane's Defence," in which she made one of her

earliest hits. After this she proposes to essay the character of Lady Teazle in an elaborate reproduction of "The School for Scandal."

Louis James has almost completed the cast of "The Merry Wives of Windsor," to be presented in various cities of this country the coming season. He himself, of course, will play Falstaff. Aphie James will be the Mrs. Ford; Charlotte Lambert, Mrs. Page; Lillian Lancaster, Anne Page; Nellie McHenry, Mrs. Quickly; Norman Hackett, Master Ford; J. Arthur Young, Pistol; and William Chrystie Miller, Master Shallow, the part he played with Hackett forty years ago.

The new comedy upon which J. M. Barrie is at work is expected to be ready next spring. As it has been secured by Charles Frohman, New Yorkers are likely to see it early. Hall Caine is to provide a new version of "The Bondman" for the autumn season at Drury Lane Theatre, London. Arthur Pinero's latest comedy, which is said to be written in his lighter vein, of which he has been too sparing lately, will be produced probably within a year's time. Edmond Rostand has written a comedy drama in blank verse for Miss Eleanor Robson. The piece is to be called "The Lady of Dreams," and the English version is to be made by Louis A. Parker, who has had much experience in such affairs.

Shakspeare will be fairly represented upon the London stage next season. Arthur Bouchier expects to produce "Much Ado About Nothing." Mr. Tree, as already reported, is to give "A Winter's Tale," with Ellen Terry as Hermione, and, a little later on, is to undertake the trying character of Macbeth. There is to be a Macbeth also at the Adelphi Theatre, where the guilty Thane will be impersonated by Oscar Asche, who has shown potentialities of a great tragic actor.

The London dramatic season, which ended with the month of June, was not at all a good one for managers in general. About one hundred plays were produced in the twelve months, and of these, if the local chroniclers are to be believed, less than one-third paid expenses. Only about half-a-dozen productions returned very large profits, and among these, "His House in Order" and "Captain D'ew on Leave" are reported as the most successful. Among the plays which had but a brief existence, six—"Clarice," "The Jury of Fate," "A Gilded Fool," "The School for Husbands," "The Lion and the Mouse," and "Shore Acres"—were by Americans; and four—"The Conqueror," "The Bond of Ninon," "The Lonely Millionaires," and "The Macleans of Bairness"—were written by English women; while two—"The Gay Lord Vergy" and "The Whirlwind"—were of French origin.

George Wright of Halifax started, some time ago, a crusade against the use of profane language upon the stage, and has written letters to many newspapers in Canada and the United States, asking aid in making protest against a vulgar and offensive practice. Every decent playgoer will wish him success; though it is to be feared he is not engaged upon a very hopeful task. But, after all, it is not the occasional use of a profane or coarse expression that is the chief offence of the modern stage. Probably less bad language is uttered behind the

footlights to-day than a generation ago. In any case, the injury done by it is not very serious. What does do harm is the exhibition of a cynical disregard for the laws of elementary morality, the presentation of vice in an attractive light, and the exposure of abnormal abominations as fair examples of that human nature to which the theatre is supposed to hold up the mirror.

The Wagner festival opened at Bayreuth on Monday. Many Americans and many European notables were present. Herr Mottl was the conductor. Alfred Bary sang the part of Tristan and Maria Wittich that of Isolde.

Two of the notable musical festivals in England this autumn are the Hereford, September 11 to 14, and the Birmingham, October 2 to 5. The programme of Hereford includes a new work by Dr. H. W. Davies, "Lift Up Your Hearts"; and one by Sir H. Parry, "The Soul's Ransom." At Birmingham a new work by Sir Edward Elgar, entitled "The Kingdom," will be produced. London will hear it on November 17, at a concert of the Alexandra Palace Choral and Orchestral Society.

Miss Elizabeth Dodge, an American soprano, made her first appearance in London at Æolian Hall a fortnight ago. Her best successes were with French songs. In the same week Miss Irene Ainsley, a native of New Zealand, a protégée of Madame Melba and a student of Madame Mathilde Marchesi in Paris, also made her début in London. Although she has not yet completed her studies, she displays a fine contralto voice.

In the first week of August four concerts are to be given at Asbury Park by the Besses o' th' Barn band from England—a band which takes its name from a quaint old Lancashire village of that name, and which consists of men who have been employed as laborers in factories and coal mines.

Unable, or unwilling, to pay American prices to musicians, the Royal Opera at Berlin is losing all its leading artists. Miss Farrar and Miss Destinn went a short time ago, and now it is Muck. Thus the *Tageblatt* announced the engagement of Dr. Muck for the Boston Symphony Orchestra:

While it is still uncertain whether the Royal Opera can retain Felix Weingartner as conductor of its orchestra's concerts, another hard blow has fallen on this institution: Dr. Karl Muck, who is, by the side of Richard Strauss, the most prominent and competent conductor of our royal stage, and one of the best in Germany, leaves us to conduct the symphony concerts in Boston. It is true that Dr. Muck has taken the Boston position only for one year, and has been allowed leave of absence by the Kaiser for the remainder of the period covered by his Berlin contract. But as this contract expires in the autumn of 1907, and the Bostonians will doubtless make great efforts to win the distinguished conductor for their orchestra permanently, we must, alas! count on his absolute loss to Berlin. It is an exceptionally heavy loss that the Royal Opera is thus to suffer, and it is doubly painful because it is an open secret that it is not for artistic reasons that Dr. Muck leaves Berlin, but solely because the material advantages he enjoys here are inferior to those offered him in Boston. The Dollar has once more won a victory.

Dr. Muck is at present in Bayreuth, con-

ducting some of the festival performances.

The Germans assert that the late Carl Lautenschläger was the first who made use of electric light on the stage. He certainly was the most ingenious "Theatertechniker" of his country. His name first became known in the eighties, when rumor told of marvellous things he did to carry out the extraordinary scenic plans devised by King Ludwig II. of Bavaria for his "Separat" performances in Munich, at which the King was the sole spectator. Without Lautenschläger's aid Mr. Conried could not have surpassed Bayreuth in the scenic presentation of "Parsifal" in New York. He was the inventor of the "Drehbühne," or rotary stage, which made it possible to present changes of scenery with unprecedented quickness. He died of cancer, aged sixty-three years.

Max Reger, whose first orchestral work, the "Sinfonietta," was one of the most widely discussed novelties of the past season in Germany, has completed another work of symphonic dimensions, a serenade in four movements. Reger belongs to the same class of Germans as Richard Strauss and Mahler, men who, since the divine gift of originating new melodies is denied them, vainly seek to atone for that by indulging in complexity, cacophony, and eccentric orchestral combinations. Regarding Reger's new serenade we are informed that the wind and percussion instruments (flutes, oboes, clarinets, bassoons, trumpets, horns, and drums) are restricted to two each, while the strings, with the exception of the double basses, are divided into two orchestras, which are to be grouped to the conductor's right and left, one of them playing *con sordina* throughout.

Hans Richter's successor in Vienna, Franz Schalk (who is favorably remembered by music-lovers here through his engagement by Mr. Grau to succeed Anton Seidl at the Metropolitan Opera House), gave some interesting information regarding music in Vienna to a London journalist the other day. He is the conductor of the Vienna Philharmonic, which, as he pointed out, is really the Court orchestra of the Emperor, by whom the organization is maintained at a yearly expense of over \$125,000. The Emperor also defrays the cost of new instruments. The members of the band are mostly Austrians, but there are a few Czechs, Hungarians, Serbs, and Dutchmen, as well as some North Germans, who excel as brass players as the French do with the woodwind. The principal players are professors at the Conservatory.

To the question: "Do you rehearse a great deal?" Mr. Schalk replied: "Not so very much. For a concert we have generally three rehearsals, but when there is a very hard programme, five or six, and group rehearsals besides." Mr. Schalk also pointed out "the significant fact that so many of the great conductors of the day—Sucher, Richter, Nikisch, Mottl, Mahler—have come out of the Vienna school." He thinks that on the whole the conducting of concerts is not so exacting as that of operas, which requires great presence of mind and coping with a multitude of forces and accidents which cannot be foreseen. "The concert conductor marches up the hill, so to say, free; but the opera conductor has several loads on his back."

Vienna had, last season, four performances of Wagner's "Nibelung Trilogy," and a dozen of "Die Meistersinger," all of which Mr. Schalk conducted.

Putnam Griswold, the American basso, who distinguished himself in Mr. Savage's performances of "Parsifal," is making a good record in Berlin. The correspondent of the *Musical Leader and Concert-Goer* says:

His leading rôles are those of the King in "Lohengrin," the Landgrave in "Tannhäuser," King Mark in "Tristan," and Pogner in "Meistersinger." He has a well-rounded, well-schooled voice and only needs more dramatic accent in his diction and singing to make him one of the leading Wagnerian basses. He was singled out for royal distinction during the recent festivities connected with the silver wedding celebration of the Kaiser and Kaiserin. The order, which is designated as a "Souvenir of the Silver Wedding," is hereditary, and not to be returned to the crown, as is the case with most German orders.

The extraordinary influence of Liszt on the creative musicians is becoming more and more obvious. Reviewing the latest *Tonkünstlerfest* at Essen, in the *Etude*, Arthur Elson writes: "At present all the ambitious young men indulge in symphonic poems"; and he gives the names. It was Liszt who invented the symphonic poem.

London has a String Quartette consisting of young women players—Mes. Henriette Schmidt, Marie Rodriguez, Jeane Levine, and Hélène Dolmetsch—whose playing is praised in the *Musical Times*. We may perhaps be permitted patriotically to doubt whether this quartette is as good as our American Olive Mead Quartette, for the simple reason that this is excelled by very few male organizations of the kind on either continent.

The most irrepressible Wagner crank in the world is Ashton Ellis of London. Some years ago he began to translate the last edition of Glasenapp's "Life of Wagner" into English. That work promises, when completed, to make up seven or eight huge volumes. Soon, Mr. Ellis began to show signs of dissatisfaction. Glasenapp was as thorough as any German professor, but he was so foolish as to throw away the litter that had accumulated in his workshop. This broke Mr. Ellis's heart. His idea of a biography is a series of volumes containing everything ever written or spoken by a man, or about him. No laundry list must be left unprinted. Accordingly, he soon parted company with Glasenapp, and began to shovel in loads of data about Wagner, rubbish and all. His fourth volume included a period of only two years. The fifth, just out, covers less than one year—the year 1855, in which occurs the London episode which Mr. Ellis himself calls "little more than a waste of time on Wagner's part." Why, then, waste a whole volume on it? Wagner died in 1883. That leaves twenty-eight more years to cover, and it is needless to say that the period from 1855 to 1883 offers much more choice and abundant material to a biographer than the period 1813-1855. Are we to assume, therefore, that Mr. Ellis's "Life of Wagner" will ultimately comprise at least thirty-three volumes?

Although Gluck's opera "Armide" was produced in Paris 129 years ago, it was given in England for the first time this month—at Covent Garden, London.

VOLTAIRE.

The Life of Voltaire. By S. G. Tallentyre. With Illustrations. Third edition. London: Smith, Elder & Co.; New York: G. P. Putnam's Sons. \$3.50.

Voltaire is, to critics imbued with the spirit of the English people, a character all but incomprehensible. Nor is the cause hard to discover. English or American readers form their estimate of men upon the tacit assumption that no person, however great, deserves admiration or even moral toleration, who does not possess the qualities of a gentleman; any hero must be distinguished by moral dignity, by self-control, and, above all, by truthfulness. The mountebank, the slave to passion, or the liar is not a gentleman, and hence he cannot be in any sense a hero. Now Voltaire fell as conspicuously short of the gentlemanlike standard as did Napoleon, and, to many Englishmen and Americans, never seemed deserving of high place among men who have benefited mankind. He was, for example, from boyhood deficient in self-control. After reaching the age when passion might have been restrained by experience and by the sense of what was due to his own eminence, he still yielded to childish and furious anger. Some one had tampered with the acting copy of his play. He thereupon fell into a rage which lasted twelve hours. He forced his niece to confess her share in the outrage, and pushed her into a chair, or into the arms of her lover. He then sent for D'Argental, and, when his old friend arrived, abused him. He finally ended up with humble and generous apologies. This is pretty well for the greatest of living French writers at the age of eighty-four.

But the violence of his emotions had nothing to do with senility. His vehement restlessness, which was the weak side of his superhuman energy, was his most marked characteristic. Voltaire, whether kissing the hand of Turgot, "who has signed the salvation of the people"; whether lamenting the death of Madame du Châtelet and at the very same moment insulting her worthless lover, Saint-Lambert. In language too coarse for repetition; whether adoring or vilifying Frederick the Great—is always the man of strong and (to Anglo-Saxon taste) undignified emotion. In nothing is he cool but in his arguments and in his lucid and simple prose. Nor is it possible to deny that he exhibits too often a touch of the mountebank. Napoleon himself did not know better how to keep himself before the world. His life was a long conflict—and to win victory he needed to hold the eyes of Europe constantly fixed upon the intellectual contests in which he invariably came out victorious. Nor was this the worst that could be said of him. His piercing glance betrayed to him the weaknesses of courts and of kings. Louis the Fifteenth was the most contemptible; yet Voltaire sought for the favors which Louis could give, and felt the rebuffs which the most despicable of the Bourbons could inflict. When in old age he had become the acknowledged leader of European thought, he was troubled because Joseph II. passed through Ferney without calling upon him.

Add to all this that Voltaire habitually

told lies; Napoleon was not a more fertile and reckless liar. Voltaire printed hardly a book of which he did not deny the authorship. The denial, made with a view to avoid official suppression of his writings, became at last what lawyers call a "common form." It was nothing else than the advertisement that Voltaire had published a more than usually pungent attack on folly or superstition. Even the war with intolerance, which was the business of his life, was marked by singular concessions to the bigots whom he detested. To build a church, or to scandalize even free-thinkers by brazen-faced confessions, followed by the solemn taking of the sacrament, may be regarded as methods of insulting the priesthood and religion; but his obtaining for one of his plays the patronage of the Pope, and still more his astounding readiness to make confession to a priest on his deathbed, were acts which, though they deceived no one as to Voltaire's sentiments, deprived even the hour of death of its dignity.

No, it is impossible for any sophist, however ingenious, to prove that Voltaire was what Englishmen mean by a gentleman. But, if this concession be made, have we advanced a step towards showing that the writer who for twenty years or more was the intellectual sovereign of Continental Europe, lacked all the elements of greatness? Whoever feels inclined to answer this inquiry in the affirmative would do well, under the guidance of Mr. Tallentyre, to consider with care the splendid sides of Voltaire's singularly mixed character.

Voltaire was born with a genius for friendship; he was a man of heart and of feeling. The strange and even repulsive relationship between him and Madame du Châtelet has an element of pathos. To her he made constant sacrifices. He was faithful to her in spirit after she had deserted him for the most undeserving of lovers. Every word he wrote or uttered after her death showed deep respect for her talents. Few could have tolerated the stupidity and egotism of Madame Denis, but to her he was the most kindly and good-natured of uncles. The admiration and the enmity which linked together Voltaire and Frederick the Great by a bond too strong to be broken by either betrays on both sides a capacity for affection which few men, whether despots or scribblers, possess. No one again can be a hero to his valet, yet Voltaire earned the admiration and the affection of secretaries who curiously combined the character of amanuensis and servant. He stood the test of the closest domestic scrutiny, and all his secretary-servants—Longchamp, Collini, and Wagnière, by far the most deserving of the three—while they recognized his faults, have recorded their conviction of his goodness and kindness. With two of these defenders he parted because of their gross misconduct towards him, and this at a time when their misbehavior exposed him to grave peril; yet in parting he loaded them with favors. It is, indeed, one of the most curious traits of character that the man who sometimes pursued his foes with relentless hatred, exhibited towards friends, even when, as in the case of Thériot and La Harpe, they had betrayed his confidence, a spirit of forgiveness.

In his lenient judgment of his friends' vices you may, if you like, trace a certain contempt for human nature. But surely it is fairer to say that cynicism passed gradually into charity. Here, however, we come across a characteristic to which Mr. Tallentyre has given deserved prominence, namely, Voltaire's practical devotion to the actual service of mankind. He was no prating philanthropist. He took a low, some might say a true, view of human nature, but he constantly sought to relieve miseries of humanity. His home at Ferney was the refuge of the destitute and the oppressed. His fatherly adoption of Marie Cernille was a noble tribute to a writer whom he profoundly admired, but it was also an act of loving humanity. Made-moiselle de Varicourt was not descended from any illustrious author. She was nothing but the niece of one among six poor gentlemen whose estate Voltaire had reclaimed from a body of Jesuits. He took her to his heart and home, he named her "Belle-et-Bonne," adopted her as a daughter, and received from her to the day of his death the reward of a daughter's love. But, though individuals attracted his affection, whole classes received his sympathy and his aid. The watchmakers and weavers of Ferney owed their prosperity to the genius, the energy, and the benevolence of Voltaire.

Philanthropy itself, however, was with him exceeded by the rarer and nobler sentiment of irreconcilable enmity to injustice. Whoever was wronged found in Voltaire the terrible advocate whose words could arouse Europe so that wrong-doers dared not face the shame of his indignation. The names of Lally, of La Barr, of the Sirvens, and, above all, of Calas, demonstrate the power of his invective, and, also, the zeal with which he performed the prophetic function of denouncing oppression. To appreciate his energetic discharge of a duty which most of us neglect, is of the more importance because it goes far to explain, if not to justify, that attack on religion which has most shocked the conscience of devout Englishmen, and is summed up in the famous watchword, "Écrasez l'infâme." The exact significance of this war-cry is matter of dispute. "L'infâme," writes Mr. Tallentyre, "cannot be translated by any single word; but if it must be, the best rendering of it is Intolerance." Our author nearly, but not quite, hits the mark. To Voltaire's opponents we must admit that his watchword meant at the lowest: "War to the knife with superstition," and that "superstition" in Voltaire's mouth included beliefs which now-a-days command the respect of all persons imbued with the sentiment of Christianity. But, when this is fully admitted, two considerations go far to explain Voltaire's position, and may entitle him to the sympathy of many who abhor language which outrages Christian feeling.

The first is, that the object at which Voltaire aimed was attainable and justifiable. On June 3, 1760, he writes to Frederick: "I want you to crush *l'infâme*; that is the great point. It must be reduced to the same condition as it is in England. You can do it if you will. It is the great-

est service one can render to humankind." All that he demanded was religious liberty, as it existed in England under George III. No man can say that the demand was unreasonable. The second is, that Voltaire saw with a clearness denied to most men the terrible and close connection between superstition and injustice. This connection is neither transitory nor accidental. Fanaticism is in every age the ally of fraud and oppression. The Dreyfus case proves that the spirit which in the eighteenth century murdered and tortured Calas might revive in full force towards the end of the nineteenth century; and Zola's defence of Dreyfus shows also that Voltaire did not labor in vain.

The attack upon oppression was the true work of his life. In this he was absolutely sincere. He told lie after lie, but he never descended to that most insidious form of falsehood under which a man forsakes his own convictions. The queer rumor, apparently credited by Mr. Tallentyre, that Voltaire was to be silenced by receiving a cardinal's hat, must have been a grim jest, though men with all his vices and none of his virtues have been cardinals. But the joke showed a complete misapprehension of Voltaire. He never deserted the cause to which he was devoted. Hence he handed down to French men of letters the inspiring tradition which has lived on till our own day, that it was their duty and glory to defend innocence against tyranny and bigotry. From this point of view Voltaire's triumphal return to Paris has a significance that is often forgotten. It was indeed a theatrical affair; its showiness seems all the more ghastly because the applause of adoring crowds caused the death of their hero. Yet the triumph was something more than a show: it was more even than the recognition by the French people of the services rendered by Voltaire to mankind. It was the public celebration of the triumph of justice and enlightenment. Yet Voltaire's last days exhibit, as did every hour of his life, the hardly explicable combination of bad and good, of pettiness and of magnanimity. The miserable attempt, which would be purely laughable were it not so mournful, to impose upon the priests and obtain a decent burial by impudent and unreal confessions, shocks every serious reader. But then, side by side with this buffoonery, we can place Voltaire's one solemn statement of his belief, written in a firm hand, at what he believed to be his last hour: "I die adoring God, loving my friends, not hating my enemies, and detesting superstition. February 28, 1778. VOLTAIRE."

JACKSONIAN DEMOCRACY.

Jacksonian Democracy, 1829-1837. [The American Nation: A History. Volume xv.] By William MacDonald, LL.D. New York: Harper & Bros. \$2 net.

"The American Nation" was first announced as a history "from original sources," a statement which in fact is printed on the title-page of each volume. The phrase doubtless conveys different meanings to different people; but in the strictest sense a history written from the

sources is generally understood to be one based upon an exhaustive analysis of all the original material, one in which no statement of any importance is made on any other authority. A twenty-seven volume history of the United States written from the sources in this strict sense would prove certainly a difficult and protracted undertaking. The very rapidity with which "The American Nation" has been published might lead one with some justice to suspect that the terms of the editor's prospectus had been rather liberally construed. Strictly speaking, the present volume is doubtless not written from the sources, nor would the author, we suppose, claim for it the merit of an original contribution. Nevertheless, Professor MacDonald has for the most part gone straight to the sources, his knowledge of which, as the footnotes make abundantly clear, is extensive if not exhaustive; the examination and use of the Van Buren and Jackson MSS. furnishing an example precisely of his care in this matter. The result is a book that is no mere compilation, but a thoroughly well-considered product of first-hand knowledge, likely to remain, we should say, for a long time to come, by far the most useful exposition of the eight years of Jackson's Administration anywhere to be found.

In preparing for a general series of this kind a single volume of which the conditions have been rather rigidly prescribed by the editor, the problem of unity, one can readily conceive, must be a difficult one, whether considered from the point of view of the series or of the single volume. How successfully the work of Professor MacDonald articulates with the succeeding volumes we are not able to say, as these volumes have not yet appeared; indeed the problem of unity in this respect is more particularly the concern of the editor. Considered apart from the series, the work of Professor MacDonald strikes one, at a first reading, as being a series of essays, chronologically arranged for the most part, rather than a coherent exposition of Jacksonian Democracy. After the two preliminary chapters on "The United States in the Thirties" and "Early Public Life of Jackson," the subject is broken up as follows: "Election of 1823," "The Beginning of Personal Politics" (1829-1837), "Tariff and Nullification" (1816-1829), "The Great Debate," "The Bank of the United States" (1823-1832), "Internal Improvements" (1796-1837), "Nullification in South Carolina," "Indian Affairs" (1825-1837), "Election of 1832," "Foreign Affairs" (1829-1837), "Removal of the Deposits" (1832-1837), "Changes and Reforms" (1829-1837), "The States" (1829-1837), "Public Lands" (1829-1837), "The Election of 1836," "The Personality of Jackson." Obviously there is here little effort to maintain a strict chronological sequence, and if unity be achieved it is not through continuity of narrative. In spite of the topical method, a certain unity of effect nevertheless emerges, the element of coherence being furnished by the personality of Jackson and the democratic revolution which he embodied so perfectly—a revolution founded in the new ideas which Western influence was bringing prominently forward to be embodied eventually in the new Democratic party. If, therefore, the reader passes from a consideration of per-

sonal politics to the tariff and nullification, from the great debate to the Bank and internal improvements with a certain abruptness (an abruptness which the author, indeed, does little in his chapter transitions to soften), he feels, after all, that these various matters are but the concrete forms which embody the new spirit; the masterful personality of Jackson contriving to inform them all with a significance that is much the same.

Nevertheless, the comprehensive treatment of the subject as a whole is not Professor MacDonald's strong point; his forte is in the management of the particular topic, nearly every chapter being an admirable presentation of the subject with which it deals. It would be difficult to imagine a better summary of the early career of Jackson, a clearer discussion of the election of 1828, a more skilful disentangling of the interwoven threads of the tariff and nullification controversies. Having isolated his topic, as it were, the author exhibits an unflinching instinct for selecting what is essential, marked lucidity in exposition, and a certain artistic neatness in the use of minor details, which serve to give to his work an excellence of form too often wanting nowadays in "scientific history." To these qualities must be added those which make for excellence of matter as distinguished from excellence of form. Professor MacDonald has in a pre-eminent degree that mental attitude which may properly be called historical. One feels that all of the evidence has been carefully weighed; the conclusions, uninfluenced by any preconception whatever, are such as one rarely feels inclined to dissent from. The most searching test in this respect likely to be put to the author of any book on Jacksonian Democracy has been met by Professor MacDonald in a way that leaves nothing to be desired. He is obviously no worshipper of Jackson, never having experienced, we dare say, anything of that enthusiasm which Old Hickory still sometimes arouses. But that his sympathies are clearly for a different type of man altogether does not prevent Professor MacDonald from fixing, with a sure hand, upon the real importance of Jackson in history, his real greatness as a man.

Yet one cannot but feel that, however unformed or contradictory his theories or his actions, Jackson nevertheless had hold of the right end of the matter in every one of the great issues of his administrations. His attack upon the Bank was brutal, but the Bank was nevertheless a gigantic monopoly whose abatement was of inestimable benefit to the political and economic life of the country. His notions about hard money were visionary, but the paper-money situation was a grave menace. . . . His treatment of France was brusque, but the claim of the United States was just, and there was but one language that France could understand. His acquiescence in the aggression of Georgia upon the Cherokee was a direct encouragement of nullification in South Carolina, but the maintenance of the Indian pretensions was impossible. In his mental processes Jackson showed the intuition of woman rather than the reason of man, but what he saw he saw directly, and from his main course he never varied (p. 310).

To hit the mark in this fashion is the rule rather than the exception throughout the entire volume.

Careful investigation, sane conclusions, clear and orderly presentation, are thus the very solid merits of Professor Mac-

Donald's work; and if the brilliant or striking phrase, profound insight, highly suggestive or illuminating idea is rarely in evidence, the fatal omissions and faulty logic which so often accompany these qualities are also absent. There is one pervading characteristic of this period in our history which one might have expected would be brought out—which the Webster-Hayne debate, indeed, furnishes altogether the best opportunity of bringing out prominently; which a statement of the author regarding Webster's speech nevertheless leads one to suppose has not been appreciated. Though giving Webster all due praise, certainly, in respect to his answer to the arguments of Hayne, Professor MacDonald concludes that, after all, he missed "the only vulnerable point of his opponent's position," which was, he goes on to say, "the failure to recognize the inevitable supremacy of the central Government, the inevitable subordination of the States in all matters over which the central authority had control, wherever such authority was not directly restrained by the letter of the Constitution" (p. 110). In supposing that Webster might have urged this point, it seems to the reviewer that something of the modern notion of evolution has been read back into the age of Jackson. That age was one in which men realized but little or not at all the "inevitable tendency"; one in which they concerned themselves much with the letter of the law, their eyes being steadily fixed upon what Burke might have called "rags and tags, and paltry blurred shreds of paper." It would hardly have strengthened Webster's position in his day, however it might have strengthened it in our own, to have used arguments that were not implicit in the Constitution. To fit the Union to the Constitution was what seemed both to Webster and to Calhoun to be the whole problem, different as were their respective interpretations of that Constitution; and their contemporaries were not yet prepared to listen to one who, like Lincoln, should speak of making the Constitution fit the Union. To solve all problems in the light of the Union as it was made, rather than in the light of the Union as it was making, was that pervading characteristic of which we have spoken—a characteristic which serves to explain much in the middle period, and one of which more might well have been made in the present volume.

All this, however, is a small matter, and if the coming volumes of the series measure up to the level of the one on Jacksonian Democracy, "The American Nation" will indeed have been a notable achievement.

A GERMAN VIEW OF MILITARY OPERATIONS IN SOUTH AFRICA.

The War in South Africa: the Advance to Pretoria After Paardeberg, the Upper Tugela Campaign, etc. Prepared in the Historical Section of the Great General Staff, Berlin. Authorized Translation by Col. Hubert Du Cane, R.A., M.V.O. New York: E. P. Dutton & Co. Pp. vii., 374. With Maps and Illustrations. \$4 net.

The object of the Great General Staff at Berlin in undertaking this history of the

war in South Africa was the instruction of German officers, and the criticism which is embodied in this and the preceding volume, which was published in 1904, not only points out British faults and errors in tactics and manœuvres, but emphasizes what in the opinion of the Great General Staff ought to have been done in the situations which confronted the British commanders. While the book is written primarily for military purposes, it serves admirably as a history of the war for more general reading.

The authors of the work obviously regard war as a business, and a business always highly scientific. Consequently they adhere closely to what might be described as the business side, and ignore much that newspaper correspondents would dwell on. They tell the number of killed and wounded, with no sentiment, and no attempt to describe sufferings and horrors. But shortcomings in this respect, if shortcomings they are, are more than made good by graphic descriptions of the terrain; the clearness with which position of opposing forces is indicated; the careful balancing of the advantages and disadvantages of these positions, and the accounts of the engagements and their results.

These were the characteristics of the first volume, which was translated by Col. Waters, R.A. They are equally those of the second, which carries the narrative from the surrender of Cronje, at Paardeberg, on February, 1900, down to the flight of Kruger from Lorenzo Marquez, in September, 1900, and to the beginning of the guerrilla warfare which went on for a year and a half after there had ceased to be a permanent Transvaal Government or an organized Boer military force. This second volume contains the narrative of Lord Roberts's march from Kimberley to Bloemfontein; of Buller's desperate three months' campaigning on the Tugela before Ladysmith was relieved; and of Roberts's march from Bloemfontein to Johannesburg and Pretoria, as well as the story of the operations in the southeast of the Free State, of those to the northwest and southwest of Pretoria, and of those in the eastern Transvaal, between Middleburg and Koomatipoort, which immediately preceded Kruger's flight from Machadodorp, and Steyn's association with the guerrilla warfare in which De Wet, Viljoen, Louis Botha, Delarey, and other Boer commanders so long harassed the British forces.

Except as regards Lucas Meyer there is throughout this second volume a tone of restrained admiration for the Boer commanders. Their tactics are at times as freely criticised as those of Buller or Warren; especially in the series of fights that preceded Buller's final success in relieving Ladysmith, they are criticised for not acting on the aggressive or for failing to follow up the reverses of the British troops. The Boer military organization, in its lack of discipline, and the easy conditions under which the men were held to service, does not, of course, commend itself to officers of a conscript army like that of Germany; but for the resourcefulness, the mobility, and the courage of the Boers, and for their ability to handle their rifles, the authors of this history make no attempt to conceal their admiration. "It was,"

they write in a very brief résumé of the guerrilla warfare, "only the complete exhaustion of the Boers, the melting away of their forces, their want of clothing, ammunition, and food, the limitation placed upon their freedom of movement by the blockhouse system, and the destruction of their homes, which, after they had made a heroic fight of it, induced the commandos still remaining in the field to accept the British terms of peace."

Buller, among the British commanders, comes in for most criticism for his handling of the campaign in Natal. Each of his three failures to break through the Boer lines and relieve White is criticised in detail. In the fighting about Hussar Hill and Hlangwane, on the 14th of February, 1900, Buller refrained from pushing an attack on account of the great heat; and his conduct in this matter is contrasted unfavorably with that of Lord Roberts, who, on the same day, also in the burning heat, did a march of some thirty-two to thirty-four miles. According to the German conception this showed that Buller was wanting in energy; for "he could not though in an extremely critical situation bestir himself sufficiently to call on his troops for a special effort." Roberts also comes in for some criticism; for the criticism which in this and the preceding volume is directed against British commanders who persistently avoided risks rather than have to report long lists of casualties. The occasion for the criticism of Lord Roberts was the engagement at Sand River, which was one of the episodes of the march from Bloemfontein to Pretoria. An energetic frontal attack was here necessary, according to German ideas of war, "but in this, as in most of the subsequent actions," write the authors, "was exemplified the frequently adopted plan of holding the enemy in front while an enveloping movement was in progress. The object in view was to cause the enemy to evacuate his position merely as a consequence of a threat on his flanks and rear—a procedure which, though it tended to the reduction of the 'butcher's bill' could never culminate in the delivery of a knock-down blow."

Again and again the British commanders are criticised for this caution. The criticism is no doubt in order from the German point of view; but political conditions and considerations at home could not be overlooked by the British commanders, and they are never likely to be overlooked so long as the people of England from whom the rank and file of the army are drawn have the power of making protests immediately felt in the House of Commons. The German critics are on safer ground when they condemn the too close adherence of British commanders in actual warfare to tactics which have been rehearsed at Aldershot, or on Salisbury Plain, or when they condemn commanders for detaching too many men from their divisions for protecting transports and supplies and other minor services. All this criticism, however, is expressed with much restraint. Most of it is in chapters, specially devoted to criticism, and thus it does not detract from the value of the splendidly told narrative,

even for readers whose sympathies were not with the Boers.

TWO RECENT NOVELS.

The Awakening of Helena Richie. By Margaret Deland. New York: Harper & Brothers.

A Discrepant World. By the author of "Through Spectacles of Feeling," "The Haggard Side," etc. New York: Longmans, Green, & Co.

Mrs. Deland's latest novel opens and proceeds with a firm tread which has not always characterized her larger books. At the same time the accustomed fine inlay work that marks all her dealings with Old Chester and its inhabitants is here peerlessly present. Here is her Dr. Laven-dar at his richest; here the child David outdoing even her own admirable record in child portraits—a creation and a treasure. There is always in relation to the lovable Lavendar a haunting sense that he is at moments a thought too ostentatiously unprofessional. His superiority to cant is estimable and delightful, yet once and again he speaks as might a mathematician who did not believe in the efficacy of logarithms. But he is a fine old fellow. May Mrs. Deland never feel impelled to assert his mortality! It is with quite a pang that we find him in the present chronicle using a muffler and thinking "the seasons are changing." Yet great hopes lie in his maxim, "As soon as you feel too old to do a thing, do it." Dr. King and his wife, Martha by name and by nature, here stand out prominent human likenesses. The longestranged Benjamin and Samuel, father and son, with "Sam's Sam" in the third generation at once a battle ground and a link, are modelled with great skill; such violent personalities that they might only too easily have been burlesques, under Mrs. Deland's moulding, they wear their exaggerations with positive dignity, even as in their long quarrel "the very lack of seriousness in the cause made the effect more serious." Helena Richie, the heroine, in her grace and sweet febleness is as winning as the men-folk of Old Chester found her; and the history of her development under strained conditions is as little morbid and irrational as such a theme could well be.

Mrs. Deland has before this made laborious solutions of impossible problems. But her problem here though tangled is not unthinkable, and she has solved it in terms of high philosophy, deep religion and broad common sense. How did old Benjamin learn Helena's secret? She never knew. The reader can only wonder if it was by that searching look which is the subject of one of Mr. Clark's illustrations.

"A Discrepant World," sub-entitled "An Essay in Fiction," might be called, but for the correction of punning, a good many little essays embedded in fiction. The scene is a Scottish village; there is a real story; there are several real characters from a lord to a pussy-cat that purred "three threads and a thrum"; there are incidents as startling as a murder, and there are many deaths. Indeed, the reader asks if the mortality may not be caused by a lack of resource. The author puts his folk into promising dilemmas, then, like the heart

in the madrigal, "cannot disentangle," and has recourse to nature's method—always ready. Fortunately, the story is told with nature's own simplicity, and the resultant for the reader is a vast cheerfulness in woe.

But when all is said, the essays, sentiments, and reflections which the story flecks are the thing, and a pithy thing. Pith, as we understand it, is a central and ultimate fact, but at the same time a slight, delicate, and fleeting affair. Several pungent pages are given to the matter of bringing a railway to a village; the questions of whether and where it shall be built, the heartburnings of the rival villages, the dark methods of the promoter, give chance for spicy paragraphs on bribery and corruption. The small field and close range of village dimensions are as a microscope. Through it larger affairs may be studied and yield admonition. The provincial way of "graft" illuminates greater operations. Even he who runs may read a lesson written in words of one syllable. The story, too, flows in one syllable with excellent definition for several characters and with many bright glints of wit and wisdom.

"Why they should have chosen the word 'natural' in Scotland to describe a person of defective intellect, it is for national pride to discover"; "A certain amount of shrewdness is not incompatible with hopeless mental incapacity"; "It is only the wise that are kind"; to an unwelcome visitor, "The sooner you go the more I'll think of your visit," give an idea of the writer's way of putting things. It is a way that suggests a pair of keen eyes looking out from under shaggy eyebrows, with a twinkle and a softening—not quite a tear.

Vues d'Amérique, ou La Nouvelle Jouvence. By Paul Adam. Paris: Société d'Éditions Littéraires et Artistiques.

Paul Adam is the best fitted by temperament, probably, of all contemporary French men of letters to interpret to his compatriots the prosperity and power of the United States. He admires force for its own sake, without regard to its uses. Of martial ancestry; he aspired as a boy to a military career. During his young manhood he was desirous of becoming an explorer and colonist, and was at one time on the point of embarking for Australia. Indeed, it is his pet lament that circumstances have made him a man of thought instead of action. He wrote a eulogy of the anarchist assassin Ravachol, because, in his view, Ravachol symbolized the latent force of the downtrodden proletariat; and he threw himself heartily into the Boulangist movement because the general of the black charger symbolized force of another order. Among his best-known romances are a trilogy of "the marvellous wills" ("les volontés merveilleuses"), and a tetralogy glorifying the Napoleonic legend. The first number of this latter series, entitled "La Force," Jules Lemaitre characterized as "the debauch of a scribe dazzled by the magnificence of material force." In other words, Paul Adam's admiration of force comes very near being a monomania. He early developed a great reverence for the United States, because of her uncommon display of force; and, long before he visited

this country, he wrote admiring *chroniques* about our captains of industry.

"La Nouvelle Jouvence" is primarily an apotheosis of the force of America. Several Frenchmen who have written about this country during the last decade or two have observed the details of our life quite as accurately as M. Adam, who makes some natural and a few inexcusable blunders. But no Frenchman has succeeded in portraying so impressively the bigness of our civilization. Although satirizing some of our brutalities and idiosyncrasies, he insists that the very aspects of our life which many of us deplore as cruel or crude are not only not inconsistent with what is best in us, but are splendid expressions of it. He sings pæans to our skyscraper, which he holds to be the architectural symbol of our genius for synthesis, pronouncing it high art because it stands the test of his own formula: "L'art est l'œuvre d'inscrire un dogme dans un symbole." He believes that our painting and sculpture will ultimately be as successful in discovering their appropriate symbols.

Our speculators, small and great, it seems, poets. Says M. Adam:

In America the wildest enterprises succeed because they attract the greatest subscriptions. They appeal more strongly than more conservative enterprises to the imagination of these feverish, adolescent crowds who want their risks to be recompensed in a fairy-like manner. If an unexpected proposition is launched by rash men already conquerors of semi-legendary obstacles which have been exaggerated by the press, national pride waxes hot for this undertaking which it loves to call "typically American." . . . Furthermore, if the prudent demonstrate that the affair in question has four hundred chances of disaster to twenty-five of success, this proportion, instead of discouraging the small speculators, procures them a formidable and delightful excitement. . . . Thus the zouaves of Magenta were kindled to heroism by learning that they were fighting one against five, and they captured the now famous line of rails. Every Yankee desires to be admired by his neighbors for "le courage à la poche." He desires it as our old soldiers desired to be commended for taking a flag, as our littérateurs desire to be applauded for having written an immortal work. The yearning for military and literary glory which used to set the hearts of our collegians beating was less enthusiastic, less delirious, less sincere than the yearning for financial triumph which sets vibrating the fibres of these Yankee citizens. . . . Like all heroes, these heroes are chasers of chimeras. They are poets.

"La Nouvelle Jouvence" has little of the classic simplicity and directness we associate with French literature. It is sadly lacking in unity and symmetry. It abounds, however, in suggestive passages; and when it is borne in mind that the volume is merely a collection of newspaper letters, supplemented by a report to the French Government on the "Æsthetic Evolution of the Present Time," the wonder is that it possesses as much unity and symmetry as it does.

Manual of Oriental Antiquities. By Ernest Babelon. New edition, with a chapter on the Recent Discoveries at Susa. New York: G. P. Putnam's Sons. 1906. Pp. xix. and 352. \$2.50 net.

This is a reprint of Evett's translation of Babelon's little work, with the addition of a chapter on de Morgan's discoveries in Susa. Seventeen years ago Babelon's

"Manual of Oriental Antiquities" furnished a welcome summary of what was known about the antiquities of Hither Asia. It was, as the writer himself described it, "a modest abridgment" of the four volumes of Messrs. Perrot and Chipiez, dealing with the architecture, sculpture, and industrial arts of Babylonia, Assyria, Persia, Syria, and Asia Minor. The theory at the bottom of Babelon's treatment of his theme was that in the old Eastern civilizations, which antedated the civilization of Greece and Rome, "only two streams of artistic influence are really to be traced—that which rises in Egypt and that which issues from Assyria." At places these were combined, as in Phœnicia and Judæa, but in general the art of Hither Asia was Assyrian in origin; and "leaving Egypt on one side, it is the Asiatic, or, more strictly, the Chaldæo-Assyrian stream, that we have undertaken to study exclusively." The last seventeen years have profoundly changed our views with regard to Oriental history and archæology, and a volume dealing with the antiquities of Hither Asia which was timely seventeen years ago, and abreast of the information then existing, is hopelessly out of date to-day. It is just seventeen years ago that the University of Pennsylvania commenced its excavations at Nippur. These, with the later French excavations at Tello, the American excavations at Bismya, and above all the extensive and long-continued excavations of de Morgan at Susa, have carried back our knowledge of history and art in the Babylonian field some two thousand years, and greatly modified our conceptions of the origin and development of Babylonian civilization. The systematic excavations of the Germans at Babylon and Ashur in the last ten years have further added largely to our knowledge of the art and architecture of later periods in Babylon, especially of the period of Nebuchadrezzar. It is precisely during the last seventeen years, the period not covered in the body of this volume, that the principal work has been done in the field of Babylonian and early Assyrian exploration. Indeed, so far as Babylonia is concerned it may be said that until within the last seventeen years no scientific and systematic excavations had been conducted at any Babylonian site.

Similarly in Palestine scientific excavations commenced seventeen years ago, with the first exploration of Tel Hesi by Flinders Petri. That was followed by the excavations of Bliss at the same site, at Jerusalem and various points in the Shephelah, of Macalister at Gezer, Sellin at Ta'anach, and Schumacher at Megiddo. While no architectural monuments of great importance have been laid bare at any of these places, much light has been thrown on the origin and early development of civilization in Palestine, on culture-practices and domestic art. In particular the development of the ceramic art in Palestine has been traced, and its history so written that we are to-day able to date antiquities by the pottery remains found with them, whereas seventeen years ago absolutely nothing was known about the pottery of Palestine, and we might even say that nothing was accurately known about its antiquities.

Within the same seventeen years falls a considerable portion of the discoveries in

Egypt affecting the earliest periods, which are of peculiar importance for comparison with the earlier Babylonian and Sullan remains, or which throw light on the relations existing at various periods between Egypt and Palestine and other Asiatic countries. Within the same period fall the discoveries in Crete which have thrown an interesting side light on the general field of Oriental antiquity, confirming conclusions obtained from other sources, that the history of ancient Eastern art before the time of Greece and Rome is by no means so simple as Babelon imagined. We now have knowledge of the existence of ancient and apparently independent civilizations of which no one even dreamed seventeen years ago. To use only one illustration, the French excavations at Susa and the American excavations at Nippur revealed in some of the lowest strata a civilization characterized by a high development of the ceramic art. The pottery of that early period is more nearly akin in color and design to the pottery found in the Ægean regions than to any pottery belonging to the latter strata in Babylonia or Persia. For some reason unknown to us, this civilization was destroyed, and the art of making this pottery altogether lost, so far as the East was concerned, somewhere apparently before 3000 B. C.

The only recognition of recent work in Hither Asia and of the important discoveries made in recent years which we find in this volume is the additional chapter, already referred to, entitled "Archæological Discoveries at Susa." To retain the body of the book unchanged and merely add this supplementary chapter was but to patch an old and worn-out garment with a new piece at the bottom. (Unfortunately, by the way, the new piece is not of very good material, even although it is new.) This added chapter only makes more evident the need of a revision or rewriting of the whole work.

Industrial Efficiency: A Comparative Study of Industrial Life in England, Germany, and America. By Arthur Shadwell. New York: Longmans, Green & Co. \$7 net.

This work presents the results of an investigation into the conditions of efficiency in international competition for the markets of the world. Although commenced before the outbreak of the present (shall we say, late?) fiscal controversy in Great Britain, it deals with the fundamental problems involved in that discussion, and should prove of interest to all the disputants, without reference to the views they may entertain concerning tariff reform. The author undertook systematic researches in leading centres of the textile or metal industries in England, Germany, and the United States, and supplemented personal observation by a careful study of the usual printed sources of information. The results of his labors, here presented in attractive form, show him to be a shrewd observer of men and affairs, who has cared more to gather facts than to spin theories about them. The "advocacy of reforms" he declares to be no part of his present purpose, believing it "a more than sufficient task to ascertain a few facts with approximate accuracy." "I have sometimes thought," he remarks, "that

something of the kind might, perhaps, be a useful preliminary to reforms; but that view has never been popular, and I do not press it."

An introductory chapter deals with the difficult and dangerous subject of national traits, American, German, English. If our author has little that is new to say upon the topic, his remarks are always intelligent and occasionally illuminating—as is his distinction between "saving time" in the United States and "saving trouble" (p. 20). Then follow valuable chapters upon the chief industrial districts of the three countries under consideration. The American reader will learn much from Mr. Shadwell's vivid pictures of industrial conditions in Germany and England; he may learn even more from the striking account of the manufacturing towns of New England, Pennsylvania, North Carolina, Ohio, and Illinois. We venture to reproduce a description of scenes in our American "Black Country":

If Pittsburg is Hell with the lid off, Homestead is Hell with the hatches on. Never was place more egregiously misnamed. Here is nothing but unrelieved gloom and grind; on one side the fuming, groaning works where men sweat at the furnaces and rolling-mills twelve hours a day for seven days a week; on the other, rows of wretched hovels where they eat and sleep, having neither time nor energy left for anything else. Nor is there anything else for them to do if they wished. I was not surprised at the English workman who told me that if any one would give him five dollars a week he would go home and live like a gentleman in—the Black Country. Five dollars a day are no uncommon earnings at Homestead, but they are dear at the price. The output is enormous and there is an appearance of great efficiency, but such industrial conditions as these are not stable. The human element demands recognition and will obtain it.

This general description of the three countries and their working people is followed by a dozen or more chapters upon factory laws and conditions, hours of labor, welfare institutions, housing, wages and the cost of living, pauperism, social conditions, trade unions, and education—elementary and technical. Although not always of equal value, these discussions are the most important portion of the book. With a keen eye for what is essential and typical, Mr. Shadwell undertakes a series of international comparisons which must challenge the attention of all students of modern industrial problems. Dealing with large subjects and covering a wide field of observation, his work cannot be always accurate, and sometimes fails to strike far below the surface; but no writer, so far as our knowledge goes, has ever essayed the task with greater success. Some German investigators might have gathered more statistics, and cumbered their pages with more footnotes; we can think of French writers who could have delighted us with more dazzling generalizations; some American economists have dealt well with certain aspects of these questions; but we recall no one who in breadth of view and genuine insight can compare with Mr. Shadwell.

The conclusions offered in the final chapter are intended chiefly for English readers. That England has been overtaken by Germany and the United States, and is in danger of being outstripped in competition for the world's markets, is the fact

which is at the bottom of the fiscal controversy. Mr. Shadwell shows clearly that the difficulty is far more deep-seated than the tariff-reformers imagine, and is due to the simple fact that Germany and the United States have worked harder and worked to better purpose. While he is disposed to concede—mistakenly, we think—that some aid may be derived from retaliatory tariff duties, he lays chief emphasis upon the necessity of a general industrial awakening from slothful habits induced by the great prosperity of the past. Of such an awakening he is already able to see many signs. The English nation, he believes, has not lost its energy; and Necessity will prove an efficient, if hard, teacher. "For these," he concludes, "and the like reasons, I think we may rely on the steady pressure of economic conditions to correct the functional disorder brought on by repletion in a still healthy body, but not yet advanced to an organic disease." To this end, such a work as Mr. Shadwell's will contribute not a little.

The Electoral System of the United States.

By J. Hampden Dougherty. New York: G. P. Putnam's Sons. \$2 net.

As a basis for a proposed amendment to the Constitution, Mr. Dougherty has prepared a comprehensive historical sketch of the working of our system of electing the President and Vice-President, from 1789 to the present day. Most Americans who have reached or passed middle life are well aware that the defects of the system entailed serious danger in the election of 1876, and a few besides United States history pupils in the schools could name two other elections involving considerable trouble; but Mr. Dougherty's book will very rarely find a reader to whom the aggregate of difficulties because of these defects will not come as a surprise. The details of this sketch cannot even be summarized here, but it should be said in passing that their relation is increased in value and constantly enlivened by apt quotations from the leading statesmen of the time, as each difficulty arose. As to the Electoral College, the author is hardly correct in saying that it quickly lost the attribute of independent judgment which it was intended to possess, for in no single case from the very beginning did it ever attempt to exercise such judgment. The existence of a foreordained candidate for the first two terms took away the chance for even a temporary trial of a theory which could in no event have survived Jefferson's organization of the anti-Federalist elements into a coherent body. By one of those annoying slips which occasionally escape even the most careful, a statement on page 135 exactly reverses the political complexion of the Senate and House portions of the Electoral Commission of 1877.

Constructively, Mr. Dougherty would eliminate the Electoral College root and branch, as not only useless, but potentially harmful as well. The ratio of State representation in the choice of the President he would leave as it is, but in the allotment of votes to the respective candidates he advocates a radical change. Public opinion has long ago declared against election by Congressional districts, and, even if it had

not, it would be unwise to adopt that method because of the premium which it puts upon gerrymandering. The present method of allowing a mere majority to carry the entire electoral strength of a State is too great an incentive to fraud when, as in New York in 1884, the whole contest hinges upon the outcome in one close State. And both the district and State methods, our author urges, are objectionable in the absolute futility which they entail upon the ballot of every minority voter. Divide the Presidential votes of each State, then, he urges, in absolutely mathematical proportion to the total number of ballots cast in the State by each contending party, and thus give each individual voter the satisfaction of knowing that his ballot has exercised a positive and definitely calculable effect on the result, when it shall be finally declared.

Mr. Dougherty has great faith in the educative influence of this consciousness of positive effect in the casting even of a minority ballot—a faith so great, in fact, as to suggest the wheedling leadership of a pet theory rather than a careful study of human nature. The average voter considers only the general result, and, if defeated there, it is small consolation to him that he had something to do in making up the electoral minority. If the proportional method were applied to the election of Congressmen in each State, the boon to the minority would at once assume a positive value, but Mr. Dougherty's proposed amendment does not extend to Congressional elections. Space forbids the details by which he would eliminate the defects and dangers of the present system of certifying and counting the Presidential votes, and provide safely against all possible mishaps in the succession. He is obliged to admit that he is baffled when it comes to the question of competitive returns from dual State governments, and unfortunately that is just the point at which the most dangerous crisis has arisen. His suggestion that a State under such circumstances might by general regulation be deprived of its right to participate, loses sight of the fact that in an era like the Reconstruction period it might put a heavy premium on the setting up of rival State governments. If the volume helps to arouse interest in the subject, both in Congress and out of it, the author will deserve sincere gratitude. Unquestionably a revision of the Constitution at this point is needed, and it can come only through the arousing of general interest.

Idola Theatri: A Criticism of Oxford Thought and Thinkers from the Standpoint of Personal Idealism. By Henry Sturt. New York: The Macmillan Co. 1906. Pp. xvii., 344.

When Bacon dubbed "Idols of the Theatre" the favorite fancies of the philosophic schools, he was doubtless indulging his sly humor with the suggestion that the solemn personages who expounded them were only acting a part, strutting about their petty stage and mouthing their technical bombast in order to impress spectators unable to distinguish illusion from reality. Now the spectators, for the most part, are content to watch the play and to enjoy the illusion, but there are always some among them who are so stage-struck

as to desire in addition to go behind the scenes, and it is to these that Mr. Sturt offers himself as a competent and willing guide.

In philosophic matters, the Oxford "theatre" is one of the oldest, largest, and most noted in the world. And so, though it does not always possess the best actors nor produce the most stirring pieces, it cannot but be interesting to watch its performances and to make the acquaintance of its chief performers. For the past thirty years, the Oxford play called "absolute idealism" has occupied its boards, and Mr. Sturt has set himself to explain, and perhaps to explode, its vogue. He takes his task very seriously, and does his work very thoroughly. He shows us everything behind the scenes, with the most pleasing zeal—the green room, the adapters of plays, the prompters, the properties in all their hollowness, nay, the very rouge-pots. They are very terrible fellows, these Oxonian sages, when you come to understand them, and the play they are engaged upon is something quite appalling, nothing less than the systematic suppression of Truth! To effect this, they have recourse to a trinity of errors, yclept Intellectualism, Absolutism, and Subjectivism, all fused together into one great "Passive Fallacy," which, nourished by the unhealthy, segregated lives of over-specialized students and "the anti-practical spirit fostered by the close out-of-the-worldliness of an ancient seat of learning," ignores the activity in the human self, and the personality which, as a voluntarist and the whilom editor of 'Personal Idealism,' Mr. Sturt is anxious to see recognized. Of the triple forms taken by this fundamental fallacy, intellectualism, which in Hegel rises to "panlogism," is the oldest and most important, and expunges the volitional side of personality; absolutism denies the validity of personality altogether (p. 18); and melts down all things mystically into the One. Subjectivism, lastly, if held consistently, would culminate in solipsism, and so (though it is not made quite clear) prove incompatible with activity, like the others.

Mr. Sturt proceeds to trace out the ramifications of these fallacies in all their details, patiently, lucidly, readably, but inexcusably. He takes his examples from F. H. Bradley (who is complimented with the lion's share of the criticism), T. H. Green, and Professor Bosanquet, though he sometimes refers also to the lesser lights, and adds a chapter on German idealism (mainly on Hegel). His criticisms are always telling and often unanswerable, and even where they seem somewhat deficient in profundity they generally get home. Indeed, it is quite amusing to watch him tackling one of the terrible tangles of vague thinking and obscure writing which occur so frequently in his victims. Instead of puzzling such things out and getting himself confused in the process, his practice is simply to suggest that the meaning must be something quite commonplace and intelligible, and to pass on his way. Now one may feel morally sure that the writers criticised did not mean anything as despicably simple as the meaning Mr. Sturt attributes to them; but it is still more certain that they will never succeed in refuting him by making clear what precisely they did mean. And so a hasty

world will probably compel them to dance to his tune, by taking them to mean what he says they mean; nor will this be an altogether undeserved reward of their studiously cultivated obscurity.

There is, however, one secret motive vital to the understanding of the philosophic situation in Oxford which Mr. Sturt has not dragged quite out into the daylight, and that is the theological. German idealism, as Mark Pattison was wont to point out, was originally imported into Oxford in the interests of obscurantist clericalism, as an antidote to the wave of naturalism which swept over England in consequence of the great scientific movement of the nineteenth century. Kantian "categories" and Hegelian dialectics had indisputable advantages in combating science, in that they disported themselves on treacherous ground unfamiliar and unintelligible to the ordinary scientific worker, on which he blundered and stumbled and could easily be afflicted with a show of defeat. And indirectly also this fashion of philosophizing could serve as a protection to theology, in that it might drive the human mind to admit intrinsic difficulties and mysteries in its secular thought, compared with which those of the Athanasian Creed paled into insignificance. And like those of theology, these mysteries of the higher truth were safe from the intrusions of the vulgar. But latterly it has dawned even upon the less discriminating theologians that their alliance with Hegelism did not yield them what they wanted; that an Absolute was not a God, that the thesis, antithesis, and synthesis of Hegel were not an unexceptionable deduction *à priori* of the Trinity; that "idealism" left no room for any real personality, but rendered freedom an illusion and immortality a despicable craze. Thus the three great Kantian "postulates" are all rendered nugatory. And, on the other hand, as in Germany sixty years ago, the "left wing" got the upper hand in the Hegelian school itself. Its literary exponents, from F. H. Bradley downwards, are more or less openly anti-clerical, though none has attained the candor of the Cambridge Hegelian, Dr. McTaggart, in avowing himself an atheist. It is no wonder, therefore, that the theological alliance is tottering to its fall, and that Oxford theologians were found willing to contribute to 'Personal Idealism,' though they will find it hard to trust the religious instincts of man sufficiently to commit themselves to a frankly empirical philosophy accompanied by a psychological theology. It is quite intelligible, however, that Mr. Sturt should have preferred to glide over these aspects of philosophy, which it is so hard to deal with in an outspoken manner.

What, now, we may ask in conclusion, is the effect of Mr. Sturt's work on our estimate of Oxford philosophy? Has he uprooted or decapitated it? Hardly that, though he may reduce the swelling of its pride, and do much to check its obfuscations for the future. For despite the scrupulous urbanity of his tone, he manages to convey a very distinct impression that the days of its dominance are numbered, that it cannot stand translation into plain English, that it is woefully lacking in originality, and shockingly uncongenial to the native bent of the British mind, which is groaning under the abstruse dogmas

made in Germany and laboriously purveyed by "Anglo-Hegelian" imitators. In what direction, then, shall Oxford look? There are many signs that her next fashion will be Transatlantic. The philosophic movement known as "Pragmatism," which is by far the most important and original contribution of America to the history of thought, has already taken as strong root in Oxford as anywhere in Europe. Nay, it has already bettered its name by there calling itself "Humanism." And even if "Anglo-Hegelianism" should continue to linger in the cloistered seclusion of Oxford, this would only show once more that Oxford was still content to play the rôle of a home for lost causes.

Mr. Sturt's position in this matter of pragmatism is not quite easy to unravel, mainly because his own positive convictions are very slightly sketched. He calls himself a personal idealist, but in practice he is hard to distinguish from a common-sense realist—to whose views, by the way, their manifest pragmatic value should restore much of their lost prestige. He is indubitably a voluntarist, but he is hardly a thoroughgoing pragmatist. Indeed, he somewhat suspects pragmatism of the taint of subjectivism (p. 142), even though he immediately gives the right answer to this charge by suggesting that the apparent "making of reality" is mainly a methodological conception. There can be no doubt, however, that, as an inside view of the present state of philosophy in Oxford, Mr. Sturt's work is worthy of all commendation. And in condensing so much and such crabbed material into so interesting a form he has achieved a considerable feat. His book deserves to be read, and doubtless will be.

How Ferns Grow. By Margaret Slosson. New York: Henry Holt & Co. 1906.

Full-grown ferns have naturally attracted to their study enthusiasts of all sorts, who have described more or less accurately the graceful as well as the stately fronds. Many of the writers have indicated the clear relations which these survivals of a remote geological past bear to our existing vegetation; and the more interesting story of the birth of a fern has been many times well told by writers on popular science, who have been almost bewitched by the surprising double life of the plant in its earliest days. But, so far as we are aware, no one has hitherto devoted, as the present author does, a whole book to a readable account of the youth of ferns.

It is a familiar fact that innumerable species of plants undergo strange metamorphoses during their early life, that is to say, during the days which elapse between the seedling stage and the dawn of maturity. Some of these metamorphoses are so strange as to baffle belief. For instance, there is a New Zealand tree, called *pseudopanax ferox*, which, shortly after sprouting from the seed, becomes a straight unbranched stem with drooping leaves, each more than a foot long. These leaves are thick and rigid. Every leaf has a notched margin with hooked teeth "capable of inflicting a severe wound if incautiously handled." The straight stem is thirty feet high, and presents the appearance of a staff on which small scimitars are hung.

Between the ages of twenty and thirty years the simple stem begins to branch at the apex, and the branches at once bear short ordinary leaves which are erect instead of pendent, and would hardly attract attention from any singularity. The old sword-like leaves all fall off. Here then is a case of prolonged youth. Of course, this is an extreme example, but there are thousands of other plants which exhibit marked peculiarities during the stage of development referred to. Professor Robert T. Jackson, well-known on account of his studies in regard to fossils, has published an interesting paper concerning certain of these metamorphoses, and he has pointed out some reasons for believing that these striking and sudden changes in form may throw light on the ancestral line. In this way, it is sometimes possible to gain more than a hint as to the early history of a species or genus.

Now, although ferns do not possess true seeds (but "spores" instead), they pass through stages which are comparable to the early stages of the seed-plants, and it is these early but not the very earliest days which the author considers. With great pains she has studied the various metamorphoses and has recorded in good photographs her interesting results. The transformations are all well shown by the engravings, but she has supplemented these engravings by clear text. It is to be regretted that through no fault of her own the nomenclature is open to criticism, but aside from this matter of names, the book can be heartily commended. No one must expect to find in it such descriptions of species as would enable the reader to determine the identity of a given specimen; the work is chiefly for the use of those who care to watch the marvellous manner in which ferns spend their youth. It is to be hoped that the author will continue her studies in other fruitful fields and bring before us the results of careful investigation.

String Figures, a Study of Cat's-Cradle in Many Lands. By Caroline Furness Jayne, with an ethnological introduction by Alfred C. Haddon. New York: Charles Scribner's Sons. \$4.50 net.

The author of the introduction to this altogether original book is lecturer in ethnology in Cambridge University, England; an enthusiastic explorer, possessed of the art of inspiring others with the interest that he finds in the study of savage life. He was a member of the British Association excursion to South Africa in 1905, and whiled away many hours of the abundant time on the voyage by teaching those who cared to learn some of his curious tricks, so that the group which gathered round him on deck came to be known as "Haddon's string band." The year before, on the occasion of one of his visits to this country, when his interest in Australasian savages was for a time replaced by the pleasure of making acquaintance in Philadelphia with some of our most civilized Americans, he initiated his new friends into the mysteries of the wild-cat's cradles that he had learned in the Far East; and the most expert of his disciples took up with his suggestion of visiting the St. Louis exposition for the purpose of learning from

the various tribes there gathered such new figures as they might know. A fascinating book on "String Figures" is the result; an admirable piece of work, from the charming frontispiece to the accurate index. Of the ninety-seven string figures here presented from many parts of the world, seventy-one are described for the first time, some from the Caroline Islands in the Pacific being contributed by Dr. William Henry Furness, 3rd, brother of the author, and all being set forth with the minuteness and precision that might be expected from the daughter of the editor of the "Variorum Shakspeare." Practically every position of the fingers taken in making each of the ninety-seven figures is separately illustrated, with the result of introducing 867 outlines of graceful hands and twisted strings.

A monographic work of this kind has a value quite independent of the small inherent importance of string figures, which represent merely the light pastimes of savages. The value of the book comes from the faithful portrayal of the figures, as examples of savage customs. The figures are, like the details of basketry ornamentation and the various methods of arrow release, facts in the natural history of man, and as such deserve patient study. That these trifles, in the opinion of experts, are well worthy of observant attention is shown by the liberal measure of space given to the methods of studying and recording them in the ethnological section of a recent German manual for explorers, prepared by Professor von Luschan of the great Ethnological Museum in Berlin. But besides professional ethnologists, there are two other classes of readers who may well give attention to Mrs. Jayne's book. Of one class are those who find enjoyment in novel and gentle ingenuity; and for these we can well imagine that "String Figures" will be an entertaining companion on the summer porch or by the winter fireside. Their friends will at first laugh at such trifling; then they will say, "Do that figure again, won't you?" and the next moment they will be asking for another loop of string, to have a try at the figure themselves. A good example for beginners to practise on is the Apache "Door"; another, somewhat more difficult, is the "Many Stars" of the Navajos, in which a very peculiar twist is introduced. "A Rattlesnake and a Boy" of the Klamath tribe will require more patience, as twenty-five cuts were found necessary to give it full illustration.

Of the other class of persons who should learn at least half-a-dozen string figures are intending travellers in distant lands, even though they be mighty hunters of big game; for a few string tricks will not only enable one to discover any new figures known to such savages as may be met with in the wilderness, but the exhibition of the tricks will serve admirably, as is known by experience, in introducing one's self to the good graces of simple and somewhat mistrustful folk. With the incentive to the cultivation of this amusing art that so excellent a book must give, it is to be expected that much material for a second volume will be gathered in a few years. To all who come upon novel patterns, we urge that their discoveries should be sent, with as full detail of native methods as possible, to the writer of "String Figures."

The Personality of Jesus. By Charles H. Barrows. Boston: Houghton, Mifflin & Co. \$1.25 net.

There are books on the founder of Christianity one can dismiss without ceremony, wordy paraphrases of the Gospels with a bit of Josephus here and there, mediocre homilies on texts from the evangelical tradition purporting to constitute a "Life of Christ." There are others, though not so many, which require attention and command respect as serious and conscientious endeavors to interpret the personality which has so dominated the Christian centuries. When a man of evident culture, who finds frequently a phrase of Plato or Pascal ready to his hand, sets out with reverence of purpose and enthusiasm of affection to declare the secret of the Master of his heart, we cannot hurriedly dismiss his work even although we find on the first dozen pages that he suffers under severe limitations. This is the case with Mr. Barrows. His book is far too good to toss aside: it is reverent, thoughtful, original at many points, and of a certain winning graciousness that accords well with its subject. Yet as a portrayal of the personality of Jesus it is well nigh a failure, and one closes its pages with the feeling that one has witnessed a tragedy, having seen a man face a noble and mighty task in brave spirit and with many of the essentials of success, and yet for lack of one essential accomplishing nothing.

Mr. Barrows essayed a task in history, and took no pains to be an historian. True, the subject requires something more than skill in historical research. The supreme requirement is just that warmth of religious feeling, that purity and fire of faith, which attract one in this essay. But if sympathy with the religious message be a necessity, the historian's skill in sifting evidence and arriving at facts is still primary and fundamental. It has become a commonplace that the founder of the Christian faith is known only at second-hand, that his parables and sermons have come down to us only through the medium of friendly tradition. One may hold the tradition to be good and reliable, and still the necessity remains of going behind what the believing community of disciples a generation or so after *thought* Jesus said and did to what Jesus actually said and did on the hillsides of Galilee. When Von Ranke was asked why he wrote such good history, he replied it was because he went "behind the documents."

Because Mr. Barrows has failed to do this, but concluded rather at the outset that appreciation of the gospels is "ground upon which the learning of the schools gives no particular advantage," blunders thrust themselves into his chapters with sad frequency. He asserts that Jesus was a Rabbi, evidently following the title used in the fourth gospel and ignoring the testimony of the Synoptists that Jesus was regarded as a carpenter, the son of Joseph, and that he forbade the Rabbinic title in his little society. Again following the fourth gospel, the author places the cleansing of the temple at the opening of the ministry, and maintains that there was a "clash of wills" between Jesus and the Baptist, passing in silence over the deep spiritual sympathy between the

two. As to faith in a future life, we find the assertion that "at the right time there did come in, to sustain his faith, and like a sort of heat lightning below the horizon, the consciousness of his power to rise even from the dead" (p. 30). Historical criticism shows that confidence in his power over death was an enthusiasm of Jesus, animating his hope and courage, and thrilling him with expectation. It was never "below the horizon." but flashed constantly before his eye as he spoke of the Son of Man returning on the clouds of heaven.

In short, this essay sketches the Christ of the Church, let us say the Christ of the most vigorous and devout Churchman, but it does not sketch the Christ of history. It contains a reverent examination of Jesus from the point of view of modern psychology and modern piety; it has

not one word of Jesus as the successor of Amos and Isaiah, the opponent of Pharisaism, the poet who applied to himself the terms of the materialistic dreams of his countrymen and made them spiritual and divine. The author has done as well as any one could be expected to do without the aid of criticism; his failure is a demonstration of the need of criticism, not only of its right to be, but also of its necessity for the answering of questions which faith is bound to ask.

How Ferns Grow

By Margaret Slosson. With 46 plates by the author. \$3.00 net, by mail \$3.25

It enables students to distinguish different species of mature ferns, and points out characteristics of the different kinds at all stages of development, and shows their genetic relations to each other and to the rest of plant life. The Sun says: "Botanical books especially, of late years, have been remarkable for wealth and beauty of illustration, but even among these 'How Ferns Grow' is notable. It is a beautiful book that every fern lover will want."

TACITUS

and other Roman studies

By GASTON BOISSIER

of the French Academy.

Authorized Translation, 8vo, net, \$1.75

As a distinguished Latinist and essayist on Roman History, of the literary type, M. Gaston Boissier has few if any rivals. To a reputation gained by his fine book on Cicero et ses Amis the veteran critic has now put the culminating touch by this exceptionally artistic yet concentrated study of Tacitus.

Following the eponymous essay are shorter sketches dealing with the Schools of Declamation in Rome without newspapers; and an extremely penetrating and mordant, yet most entertaining study of the epigrammatist Martial; undoubtedly the best thing available on that poet in English.

Mr. MORLEY ROBERTS'S
Masterful Novel of Society.

The Nation.

NEW YORK, THURSDAY, AUGUST 2, 1906.

The Week.

Congress could not remove a single tax for the benefit of the Filipinos, but it managed to clap an odious new tax upon them. The legislative record of it is briefly this: A bill imposing a tax of 100 per cent. upon the cheap grade of cottons which the Filipinos most use was reported to the House on January 25; on February 9 it was called up and "explained" by Chairman Payne, and passed without a division; in the Senate, it was sent to Lodge's Philippine Committee, and on February 22—fitting day!—was reported out and passed without question or division. Now, who originated this legislation, and with what motive? It was not proposed by the Philippine Government. It was stoutly opposed by our own collector of customs at Manila. But certain cotton manufacturing "interests" of New York asked for it. On what ground? Frankly and brutally, on the ground that they could not compete with Englishmen in making this particular kind of cotton, as their looms were not adapted to making "splits"; therefore, the poor Filipino must be forbidden, practically, to buy this material, and compelled to purchase the more costly American product. No meaner, greedier piece of legislation has ever been enacted, but Congress passed it without debate, and the President signed it without a protest. Yet we know, of course, that we are treating the Filipinos with a generosity unparalleled in the history of colonization—or of cant!

William J. Bryan proposes that the reception in his honor when he returns from abroad be conducted on the principles which good citizens of both parties would like to see applied to political campaigns. He would accept no contributions from corporations or "questionable sources." No gift over \$50 will be taken at all. All over \$5 will be entered in a book subject to public inspection. Prompt as Mr. Bryan is with his suggestion, it comes four days after the appeal for small subscriptions from Chairman Sherman of the Republican Congressional Committee. "We desire to maintain the work of this campaign," he says, "with popular subscriptions of \$1 each from Republicans." If every man who voted for Roosevelt in 1904 should really contribute one dollar, the party would have an enormous fund. What Mr. Sherman will actually get, nobody knows. This is to be a year of meagre campaign funds. Party managers, local

State, and national, are planning to get along with less money. In various parts of the country rival committees are forming agreements "to abstain from the use of money or other valuable things to control elections." To some extent, this is merely making a virtue of necessity. It is small hardship to agree not to spend money when a party has not got it. Democrats who have enjoyed but few large corporation checks of late years find it easy to renounce them now. Yet there is another motive, a genuine and widespread desire to see our campaigning put on a cleaner basis. The fact that so many party helpers have been receiving money for services has in itself discouraged enthusiastic and disinterested help. But that the American people have not lost their capacity for giving joyous and unselfish aid to a cause in which they believe is abundantly proved by the story of such organizations as those of Folk, Jerome, and Colby, and the Philadelphia "minute-men."

If Mr. Bryan really intends to force a fight on the tariff this autumn, he will pursue the wisest possible policy. Only a stupid general would fail to take advantage of an enemy's weaknesses; and the tariff dissensions in the Republican ranks in Iowa and Massachusetts are plain. There is also a growing uneasiness in other States over the decision of the leaders in the conference at Oyster Bay to "stand pat." Issues are not made by party leaders but by the people. Whether any one likes it or not, the tariff is going to be in this campaign. The Republicans could not prevent this by their foolish pronouncement, but they have virtually challenged the Opposition to bring the question to the front. Mr. Bryan has a magnificent opportunity before him when he returns, and if he can reveal clearly the protectionist idol's feet of clay to a long-deceived people, he will render a great and patriotic service.

Though the American Federation of Labor has not yet published an official blacklist of the Congressmen marked for defeat as "enemies of labor," Mr. Gompers asks for a contribution from the impoverished toilers of \$2,000,000. The Federation is openly aiming to strike down some of the ablest men in the House. Beginning with Speaker Cannon, who has been charged with more "deviltry" than any one else in opposing labor legislation, the attack is to be directed at all the Republican members of the Judiciary Committee. Among them are Messrs. Jenkins of Wisconsin, Parker of New Jersey, Palmer of Penn-

sylvania, and Littlefield of Maine. These gentlemen had the effrontery to set up their notions of good law and sound public policy against those of Mr. Gompers. Members of the Committee on Labor, including Vreeland of New York, Eartholdt of Missouri, and McCall of Massachusetts are also doomed. In a way, organized labor is consistent in opposing such vigorous and independent men. It would apply unionist standards to Congress, and allow no room for exceptional merit, but reduce all to a dead level of mediocrity, ready to take orders from walking delegates. But we shall be much surprised if the courage and character of men like McCall and Littlefield are not fully recognized by their constituents.

The Texas primary serves to call attention anew to the progress of the movement for the extra-legal popular election of Senators. Senator Bailey, who carried Saturday's primary without opposition, is the seventh man to receive a party nomination for a Senatorial term beginning in 1907. Arkansas, Kentucky, Louisiana, Oregon, Tennessee, and Virginia have already acted. Senatorial primaries will also be held either under party rule or State law, in Alabama, Illinois, and several other States, while in another group, including, probably, Idaho and Nebraska, the parties will simply nominate candidates for Senator along with their State officers. The result of these various makeshifts is that at least a third of the thirty vacancies occurring in the Senate next year will be filled by a virtually popular election. Some six years hence, when all the States with up-to-date primary laws applying to the Senatorship have filled their Senatorial seats, it is going to be interesting to compare the members chosen by the old and the new method.

The gunboat *Bancroft*, after only thirteen years of service, has been transferred from the Navy to the Revenue Marine. Built as a practice ship for the naval cadets at a cost of over \$300,000, this little vessel proved unsuccessful whether as a training ship or cruiser; and to avoid further heavy expenses for repairs it has been given away. The *Bancroft* is the third ship of the "new navy" to go off the active list, the *Philadelphia*, built in 1889, being the first and the battleship *Texas*, which dates from 1892, the second. Of these, the *Philadelphia* cost about one and a half millions and the *Texas*, always a "lame duck," over three millions, exclusive of repairs. The disappearance of these ships clearly illustrates how short-lived the modern steel vessel is as compared

with the wooden warship, and also how wasteful governments are. Had these vessels been privately owned, their life would have been fully three times as long, even in the exacting merchant trade. For example, the Cunard liners, *Umbria* and *Etruria*, put in service in 1885, are still making regular trips from New York to Liverpool. They are soon to be withdrawn, but not because there is any falling off in their engine power or because of any excessive expenditure for repairs, as in the cases of the *Bancroft*, *Texas*, and *Philadelphia*. Giving place to more modern vessels, the *Umbria* and *Etruria* will still perform valuable service for many years on other routes. Fashions in men-of-war change more rapidly than in ocean liners; and the government service is costly and wasteful since nobody has a care whether its *matériel* is well looked after. The theory is that Uncle Sam has an inexhaustible purse for repairs and renewals.

The new meat-inspection regulations issued by Secretary Wilson certainly deserve the name of "comprehensive." For each specific criticism that has been made of the handling and packing of meats there seems to be a new provision. Inspectors are to follow every stage of the processes of packing. The crux, of course, lies in the penalties the withdrawal of the Government label and the exclusion of the offending firm's goods from interstate and foreign commerce. This penalty is not only adequate, but exactly suited by its character to the particular offence. An especially praiseworthy provision is that the penalty is imposed for failure to "tank" condemned carcasses. This simply means that the city of Chicago and the State of Illinois will no longer be dumping grounds for products which it would be illegal to sell anywhere else. It now remains for the packers, aided by the new Government tag of such enormous value that long-sighted business men should have prayed for it long ago, to build up their shattered trade in canned meats and by-products.

Nothing more swiftly arouses the resentment of the American public than a rise in the price of ice. This has been once more shown in several of our cities. It is a characteristically American attitude, for in European countries, even in those like Italy and Spain that have summers warmer than ours, there is hardly an ice question at all. The natives probably do not consume as many pounds as we do tons. Our use of ice for all imaginable purposes is, indeed, one of the things that most strike visitors from Europe. The alpha of our every day, they note with astonishment, is a glass of ice-water placed be-

fore us the moment we sit down to breakfast; the omega, a pitcher of ice-water sent to our bedrooms. For preserving meat and all such uses, ice is undoubtedly one of our greatest blessings. But whether our extraordinary craving for iced beverages makes for well-being, is another question. It is an astonishing thing, this craze of our men and women for arctic summer drinks, this crowding of the drug stores, where people stand two or three deep, waiting their turn to order a glass of ice-cold soda water—a cruel maltreatment of the stomach. In Berlin there is a law punishing liquor sellers for serving beer below a certain temperature; with us, beer is almost invariably sold so cold that it is not only injurious, but deprived of much of its agreeable taste. Of course, it is useless to preach; we cannot expect human beings to be as rational as animals—an ass, for instance, who refuses to drink water when too cold or too hot. But those missionaries who cater to the craze for ice among the poorer classes, could certainly do much good by teaching moderation.

Judge Calloway of Augusta, Ga., unquestionably spoke for many of the thinking planters when he said recently of the attempt to introduce white labor in the South:

I prefer first to experiment with an effort to improve the negro as a farm laborer, cropper, and tenant. I believe that our present labor can be greatly improved. At least it is well worth our while to make a tremendous effort in that direction. If the negro is not a successful farmer, it is not altogether his fault. He has been working our lands and ploughing with our mules and hoeing our cotton all his life, and we owe it to him, as well as to our own interests, to teach him the best methods of farming.

From Mississippi, on the other hand, it is reported that the newly arrived Italians are having an excellent effect in toning up the negro workers. But whether this competition makes a certain amount of white immigration desirable or not, it is obvious that the best investments the South is making to-day are the sums spent to render the negro worker more intelligent and more industrious. A prominent North Carolinian land and mill-owner is building schools and model cottages for his colored workers, whom he describes as the "best labor in the world"; and in their devotion and loyalty to him and their willingness to work hard for long hours he finds an ample reward. It is literally dollars in his pocket to aid his employees in this way; and the envy of his business rivals is proof that others besides himself realize the wisdom of his plan.

English Imperialists, we knew, were much harrowed by the proposal to re-

store local government in the Transvaal, but we were not prepared for such a *Miserere* as Kipling has emitted on that subject. Nothing, we should say, could plunge Englishmen into profounder dejection than Kipling's poem except one of Alfred Austin's. Two of the six stanzas—presumably the best, though it is hard to see how the others could jog-trot in drearier commonplace—have been cabled from London. The unofficial laureate is seldom happy in this kind of political verse. "The Truce of the Bear," "The Sin of Witchcraft," and the rest—one Barrack-Room Ballad or the "Dirge of Dead Sisters," is worth the lot of them. Some one ought to paste on the wall of Mr. Kipling's bedroom, or wherever his eyes roll in a fine frenzy, the couplet apropos of Scott's poem on "The Field of Waterloo," as a warning against further ventures into a dangerous field:

Of all who fell, by sabre or by shot,
Not one fell half so flat as Walter Scott.

The woman question in all its aspects is occupying more and more space in German newspapers. On one point all are agreed: that it is high time to legislate for the protection of married women employed in factories. Of more than a million women thus engaged in the Empire, nearly one-third are married. These wives average seventeen hours of labor a day, eleven of them in the factory, the others at home, doing domestic work. In addition to this they are expected to rear children. They age soon; anæmic, apathetic, they fade away and end their lives mostly as invalids, often a burden to the community. The infant mortality, which, throughout the Empire, averages 20.7 per cent., rises in the manufacturing centres of Saxony to 49.3 per cent.—a figure which, to put it plainly, is an accusation of wholesale murder. The simplest remedy for these evils—prohibiting married women to work in factories—is said to be impracticable, because the factories need the workers, and the women need the wages. In a pamphlet written by Dr. Friedrich Schomerus, the suggestion is made that the conditions could be greatly ameliorated by encouraging the plan of engaging married women for half-days only. Many of them would thus be able to earn what they absolutely need, while the manufacturers would be able to pay these women higher wages, because two sets working five hours each would be more efficient than one set working ten hours or longer.

German university circles have been deeply stirred by the suicide of Prof. Paul Drude, the successor of the famous Von Helmholtz in the chair of experimental physics at Berlin. Only forty-two years of age when called to this

position, Professor Drude was looked upon as one of the most distinguished of Germany's numerous men of learning. He shot himself without leaving a word to explain his action; his most intimate friends are confronted by an "inexplicable psychological puzzle," as four of his colleagues have declared. They admit the possibility of Professor Drude's having been mentally overtaxed, but they point out that if he had asked for aid the University would have been quick to supply him with another assistant, precisely as the authorities came to the aid of one of their number whose health temporarily failed. From the beginning, Professor Drude seems to have feared that he might not prove equal to following in the footsteps of Helmholtz, and probably he took his life in a moment of despondency. Either the high standard he set himself or the renown of his predecessor has therefore deprived Germany of one who should, as the entire press declares, for twenty-five or thirty years more have added to the nation's fame and to the sum of human knowledge.

The property in Zion City and its industries did not, according to a judge of the United States Circuit Court, belong to John Alexander Dowie; a receiver has been appointed for the whole enterprise; and later the people are to vote for a new general overseer. Thus this extraordinary industrial and political community enters upon an entirely new stage, no less interesting than that through which it has passed. There have been a hundred or more communistic societies in America. They have differed in every external particular, but the only ones which have been able to keep going are those founded on a religious basis. The Fourier "phalanxes," with all which held their members by a purely economic tie, have either died or lost their coöperative features. Dowie's community, with six or eight thousand people, is now something like four times as populous as the largest and most successful communistic body in the world, the Amana Society in Iowa. How, if at all, it can sustain itself, is the question to be solved. One peculiar feature is that money received from contributors all over the world is being applied to the well-being of those on the spot. The residents of Zion City are getting the benefit of much more than they put in. This certainly gives the new overseer one advantage from the start.

The city judge of Yonkers who sentenced an automobile owner to jail for two months on the ground of criminal liability, although the owner was not himself operating his car when the crime occurred, lays down a principle which, whatever the courts may finally

say about it, appeals to all who use the roads for walking and driving. If the owner is to go scot free where there is a wilful misdemeanor, we shall soon see chauffeurs taking their punishment in the spirit of the European editors who are hired merely to go to jail whenever their newspapers commit *lèse-majesté*. On grounds of public policy, there is every reason why the owners of machines should be made to feel a proper responsibility. There will, however, be serious miscarriages of justice unless judges discriminate between avoidable and unavoidable accidents. In the Yonkers case there seems to have been no excuse whatever: the persons injured were sitting in a carriage which was not in motion when it was run into and overturned. The driver and owner of the automobile are therefore open to the severe punishment they have received. Had the collision been due to a sudden defect in the steering apparatus or to failure of the brakes the aspect of the case would have been changed. Upon the reckless and inhuman motorists—of whom there are still far too many—the Yonkers decision should have a beneficial effect.

A movement back to the farm has begun. Prof. L. H. Bailey of the Cornell Agricultural College sets forth in the current number of the *Century* the results of an inquiry among students who intend to take up farming. He finds 261 such young men, 68 of them town or city bred, and 193 country bred. Presumably they represent a much larger class distributed through colleges and schools all over the country. Farming, having become a branch of applied science, has for a long time been pointed out as offering great opportunities for educated men with capital. Yet one of the striking points about the replies to Professor Bailey's inquiry is that, while all intend making a living off the farm, few speak of monetary profits as one of the inducements. Sixteen of the town-bred suggest that "there is money in farming," while thirty-nine of the farm-bred call it "a profitable occupation." Yet not a member of either group includes financial profit among the "personal desires" that brought about this choice of vocation. Both with the city and country-bred, the "love of out of doors and of nature" and the "independence" of the farmer's life are the commonest reasons. No less than fifty-nine, and this is an unexpected revelation, profess a love for farm work. But above all it is the "simple," outdoor life that calls. Thus it may be fair to say that what economic inducements alone could not accomplish, nor yet the mere interest in scientific agriculture, has been achieved by the combination of these two with the rekindled fondness for getting back to the soil.

Another tragedy of Pittsburgh sudden wealth passed to a new act this week in the decree of divorce, undefended, granted against the President of the United States Steel Corporation. When the full story of the "steel millionaires" comes to be written, it will need no Juvenal to point the moral of human vanity. The sordid details of weak heads turned and characters as unstable as water swept away to ruin; the heaping up of money, meaning the heaping up of scandal and sorrow and crime; the rush of the new rich into the vices which they seem to think must be as vulgar and flaunting as their wealth will bear—all this will bite in its own truth, as old as Solomon, as new as the latest transcript from the criminal court. An incidental evil of this moral upset was rather strikingly disclosed in the melancholy Corey trial. In asking for the custody by the mother of the sixteen-year-old son, Mr. Corey's sister said that her brother was not a fit person to bring up the lad. Then she added: "I do not think any New York man is fit to have charge of a boy of his age." "Do you mean all New York men?" "I mean wealthy New York men." Allowing for the excusable personal bitterness of the saying, there is enough clear truth in it to give the reflecting pause. Even when there is no occasion to shudder at the associates of a rich man, it is patent that he has an uncommonly fine chance to add his son to our collection of *jeunesse dorée*—silly, incapable, lavish, offensive, noisy. This spoiling of sons by wealthy fathers is peculiarly a habit of the newly rich. Where money has been long in the family, the possession of a few millions does not constitute an irresistible temptation to rush out and join the herd of swine.

With the possible exception of devastating fire, the greatest enemy of our forests is the insatiable demand for wood pulp. One is bound to welcome, therefore, the promise of any relieving invention, such as the manufacture of paper from the fibre of the cotton stalk. This is now announced as having passed the experimental stage—though we are bound to state that there are doubters. It is a suggestive coincidence that it is in the forest-State of Maine that a company has been organized for exploiting this method. All grades of paper can, it is said, be manufactured from cotton stalks, and by-products, such as alcohol, nitrogen, material for gun cotton and smokeless powder, can also be secured in paying quantities. About 10,000,000 to 12,000,000 tons of raw material, it is estimated, could be obtained in the cotton fields of the South, increasing their value by nearly \$10,000,000. That would represent the saving of many a square mile of valuable forests. The pros and cons are eagerly debated in the Southern press,

TRAINING IN PATRIOTISM.

How shall nations be trained in patriotism? The question always seems to press upon Anglo-Saxons immediately after they have tasted war. Here in the United States patriotic societies have flourished prodigiously since the victory of 1898; and the cult of military forebears is carried on with fierce enthusiasm. It has become an offence to remain seated when the national anthem is played, and a crime to use "Old Glory" as an advertisement. Our school-houses now have each their stars and stripes. The excuse is that we must neglect no opportunity to foster patriotism. There seemed to be sufficient to go around in 1898, and there was even more in 1861. Yet there never is enough to suit those who can measure devotion to country only by readiness to fight for it.

Just now Lord Roberts, Rudyard Kipling, and the London *Spectator*, a formidable trio, are wrestling in England with the momentous question. Lord Roberts mourns because all Englishmen are not made to imbibe patriotism while serving for two years as military conscripts. The *Spectator* is "anxious to see every boy trained to arms," but, strange to say, it has doubts if this is sufficient to make a patriot of him. Patriotism, it explains, "demands above all things seriousness, and its one enemy is frivolity." Logically those who believe that patriotism can be manufactured by legal enactment should frame a statute to banish, expel, and forbid frivolity and its twin, levity. No such easy way out for the *Spectator*. It says:

How is patriotism to be taught? The first step is to recognize it as one of the chief ends of education. No new curriculum, no special subjects, are required. It is the spirit in which the teaching is given that matters. History will cease to be a dry catalogue of dates and persons if the child is once inspired with the magnificence of the past, and is made to feel himself a sharer in the heritage. So, too, with literature. English literature is the finest manual of patriotism in the world, and many a boy who is insensible to literary beauty is not insensible to the practical lessons at the heart of it. It is the same with the special sciences, with geography, with economics, which acquire a direct practical interest when brought into connection with the State of which all are members.

But would even this counsel of pedagogic perfection produce the end the *Spectator* desires? In Russia, of late years, all its conditions might have been fulfilled and yet the conventional type of patriotism would still be sadly to seek. A share in the glories of Catharine and Peter has surely kept no Russian student from treason to the Czar, and to the present organization of the empire. The magnificence of the past has made no Russian mujik a whit more ready to die in Manchuria at the hands of a lit-

tle known enemy for a still less understood cause. So long as the Russian flag stands for what it does, it will inspire precious little of that kind of patriotism which seems dearest to the Society of Colonial Wars and other organizations for ancestor worship. All possible teaching of history, literature, science, geography, and economics, all playing of national anthems, and all appeals to present an unbroken front to the enemy, could make no liberty-loving Russian less "disloyal" than he is to-day. Indeed, the more educated the Russian, the more he knows of history and economics, the more certain is he to be disaffected toward the present Government. Contrast his situation with that of the thousands of German and French and Irish-Americans who fought for the North during our Civil War. The ardor of these men in our cause proves that the finest type of battlefield patriots may be found among people with only superficial education in the history and language of a recently adopted country.

The truth is, that love of country, in the high and proper sense, cannot be taught. It is commanded by the country which deserves it. Mere readiness to go to war is often not patriotism at all, but a survival of those savage, animal passions which always lie too near the surface. Give men justice, freedom, and equal treatment before the laws, and you do more than all possible schools and schoolmasters to intensify their national love for land and kin. Try to stimulate this by hot-house methods, and you make patriotism artificial and false, an idle name; you stifle the noblest kind of love of country, now exemplified in Russia—the readiness to overthrow duly constituted authorities who betray their trust. It is not shouting for the old flag and an appropriation, it is not grabbing special favors under cover of a tariff law that kindles the pure white flame of patriotism. It is doing justice and loving mercy.

More than a century before Lord Roberts, Kipling, and the *Spectator* favored the world with their profound views on this topic, the greatest political philosopher that ever used our tongue spoke the final word about it. It was in 1775, when Parliament was sorely troubled by the unpatriotic conduct of the Americans. "My hold of the colonies," cried Burke, is in the close affection which grows "from similar privileges and equal protection." "Let the colonies," continued Burke, "always keep the idea of their civil rights associated with your government—they will cling and grapple to you, and no force under heaven will be of power to tear them from their allegiance." And what Burke says of the colonies is equally true of individuals. Patriotic songs and declamations, flag-railings and the drilling of militia—these are all well enough in their way.

But they are purely superficial. They are nothing and worse than nothing unless they rest on the firm foundation of "similar privileges and equal protection."

The patriotism thus developed transcends the petty bounds of city, State, or country, to embrace mankind. It hates injustice and oppression wherever they exist. It makes cause equally with the tortured negro on the Congo and the massacred Jew in Bialystok. This wider patriotism was urged in an eloquent address by William Everett a few years ago. It is urged again by Max Forrester Eastman in the last *International Journal of Ethics*. Justice, he points out, has overshadowed the interest of the individual or even the community. Of late "the custom of just thinking has begot international law," but until every nation subscribes itself as a part of the constituted governments of the world, there will continue wars and international rivalries, largely because of conceptions of patriotism as something national instead of international. The patriotism that is taught as a dogma can only retard the progress of the world; for instilling a narrow patriotism into a good citizen is merely, as Mr. Eastman points out, giving him "an additional quality, and that quality is injustice." It provokes in him an exaggerated military enthusiasm and spirit of belligerency. It opposes international arbitration simply because arbitration requires each nation to refrain from those "patriotic" hysterics which are dear to many of its rulers and citizens.

NEW YORK CITY'S BOND SALE.

The announcement of the bids for the New York city bond issue of \$12,500,000 is one of the striking incidents of the year in the light it throws on the financial situation here and abroad. The loans placed by the city during 1905, at 3½ per cent., the rate then usual, sold so low that it became doubtful whether another issue of 3½ per cent. would bring par. Consequently, when \$20,000,000 of bonds were offered last February, the rate was advanced to 4 per cent. Those bonds brought 108—a fairly good margin over par, but a price making the annual cost to the city the highest on any loan in more than a decade. Since then, the finances of the municipality have been much discussed. Mayor McClellan, in his message of May 29, took as cheerful a view as circumstances admitted. He pointed out the margin of \$83,000,000 left for borrowing within the constitutional debt limit, 10 per cent. of assessed real estate valuation; and he referred to the plan of issuing bonds against uncollectible taxes, in order to enlarge the scope of borrowing. But he ended by a warning that the policy of extending the

debt on the basis merely of increase in the ratio of real estate assessment, was a hazardous expedient.

At about the same time, Frank A. Vanderlip, vice-president of the National City Bank, speaking to the Savings Bank Association, made the prediction that within ten years the 4 per cent. bonds, which had just sold at 108, would command not less than 125. Yet last week's bids for a second 4 per cent. loan averaged less than 101. Under the Greater New York Charter, corporate stock may not be sold for less than par, nor may it pay a higher interest than 4 per cent. Clearly, with so small a margin, it is time to take thought.

Naturally, this outcome of the city bond issue is contrasted with the recent success of the United States Government's bond issue of \$30,000,000 in 2 per cents, at an average price of 103.95. The parallel, however, is unfair. The market for national bonds, always artificial, has been made unusually strong by the special terms offered by Secretary Shaw to the national banks, the only customers for the loan. When a United States bond can be used as a basis for bank-note circulation, when the Treasury guarantees that one-third of the purchase money will be left with the banks in the form of public deposits, and when outstanding issues are practically exhausted, it is manifestly unjust to compare the price obtained by Secretary Shaw with that at which Comptroller Metz must place the city loan. A glance at other public securities, however, will reveal more than one parallel to the situation of New York city. Notably British consols, quoted seven or eight years ago at 113, have sold this week below 87. This decline has been generally ascribed to the enormous load of new British Government securities, placed on the market, first by the Transvaal war, then by the Irish Land purchase. English economists have argued that the market for high-grade securities with a small yield is necessarily limited, and that a sudden and great increase in supply can hardly fail to depress the price. This argument is equally applicable to New York city. The \$430,000,000 net indebtedness is not, relatively, large for a municipality of 4,000,000 people. But that is not the only point. The question is simply one of demand and supply; and New York has been manufacturing securities too rapidly for the market to absorb.

The question naturally arises, What will the city do? During recent years the average annual increase in the debt, has been \$50,000,000; the actual issue of long-term bonds was \$37,960,934 in 1905, and \$78,428,337 in 1904. Since \$31,000,000 in bonds, including last week's allotment, have been issued this year, the annual average has already been nearly reached. The city must then

pause, if possible, until the bonds already issued have found permanent lodgment. New York can borrow in anticipation of its revenues without being subject to the restrictions on long-term loans; but these revenue bonds are by law based on tax receipts for the ensuing year, and must be promptly paid from the proceeds of such taxes. There remains only the very limited recourse of purchases by the city itself for its sinking fund.

Present conditions in the investment markets should not be permanent. While the large issues of bonds by New York are one great cause of the city's present situation, exactly the same process has been going on—especially during the past two years—with every borrowing government and corporation in the world. This phenomenon became particularly noticeable a year ago, and, coinciding since then with the immense absorption of capital in this country, it not only explains, in part at least, the present scarcity of capital, but indicates a state of affairs which may be merely temporary. Until a change occurs, however—either through liquidation of some of the present enormous commitments of capital, or through the gradual increase of a supply—municipal governments will have to move cautiously. We should regard it no misfortune if New York city were compelled to economize. Sometimes nothing short of a crisis will drive a public body to serious consideration of that duty.

SIR ROBERT HART AND CHINA.

If, as was recently reported, Sir Robert Hart is to retire from office, the Chinese Government will lose its most useful servant. For forty-seven years this remarkable Irishman has been identified with the administration of its customs service; during all the great popular upheavals of this long period he has held his place with unshaken fortitude. Neither Taipings nor Boxers could drive him from his labors. But when the Chinese Government last May subordinated Sir Robert to two Chinese officials, it became probable that he would soon complete his work and retire to a rest to which his seventy-one years alone would entitle him. If his withdrawal is prompted by what seems like rank ingratitude, he has at least the satisfaction of knowing that his admirable achievements have been recognized throughout the world. He is pointed to as an example wherever publicists discuss the White Man's Burden.

Indeed, the London *Times*, in an obituary of Sir Robert when it seemed probable that he had been killed by Boxers, merely repeated the common opinion in declaring that the Inspector-General of Chinese Customs combined "a wonderful faculty of organization

with a retentive memory, complete mastery of detail, and sound judgment." His grasp of Chinese ways of thought amounted to "intuition, while his personal tact and Irish warmth of heart have been ever constant features of his administration." "These qualities," it concluded, "combined with limitless capacity for work, considerable ambition and love of power, are the foundations upon which Sir Robert Hart has built up his own great reputation and the customs service; in the latter, posterity will doubtless recognize one of the most striking monuments ever produced by the genius and labor of any individual Englishman." This tribute was the more remarkable because the *Times* frequently charged Sir Robert with being too fond of the Chinese; and even hinted that, like other Europeans long resident in the East, he had undergone a subtle transformation of mind which made him regard events entirely too much from the Chinese point of view.

Whether this was or was not a correct criticism, some future historian must decide. To us it seems probable that Sir Robert Hart's ability to sympathize with the Chinese was one great cause of his extraordinary success. The *Spectator* has recently found it necessary to chide English colonial administrators for not treating the natives "at least as well as a British officer would treat British soldiers." Had Sir Robert Hart been like the too familiar type of European civil servant abroad, he would have carried a chip on his shoulder. The frequent refusal of the Mandarins to communicate with him save through minor clerks would have been a deadly insult, calling for diplomatic negotiations. Fortunately, he has been too broad to take such an attitude, and he has found satisfaction not in the few honors and emoluments bestowed upon him, but in doing his duty quietly and modestly. The Englishmen in the Chinese customs service sometimes complain that Sir Robert is kinder to the foreigners in his employ than to them; but this impartiality, this ability to ignore national lines, is surely as much the explanation of his long continuance in so trying a position as his rare financial ability and foresight.

It was in 1861 that the "collectorate" of the treaty Powers—Great Britain, France, and the United States—was given authority to collect the Chinese Imperial revenue. Mr. Hart, as he then was, became almost immediately the acting head. Two years later, at the age of only twenty-eight, he became Inspector-General. Under his guidance, the maritime customs service speedily became not a local Shanghai affair, but a complex organization, collecting and administering the one substantial revenue of the Government. With a staff of only 200 foreign employees, he be-

gan his work. By 1899, 503 Englishmen, 490 other foreigners, and 4,611 Chinese were under his orders, and instead of 14 ports, he had 32 under his control. With his force he undertook the lighting of the coast and inland waterways, controlled a fleet of revenue cutters, and established a European university at Peking. After the war with Japan he also took in hand the reorganization of the postal service. Not the least of his achievements was the elaboration of his plan for subjecting to foreign control the collection of inland duties in the Yang-tsze provinces, which became collateral for the loan of 1898. The maritime customs alone made it possible for China to meet the Japanese war indemnity; they, with the native customs administered by Sir Robert Hart, are the main security for the Boxer indemnity of \$320,000,000. The annual charge on all debts secured by the customs is now \$28,850,000, and had there not been this security in addition to the railways, the four great foreign loans placed since 1895 would hardly have been feasible. How the Chinese will get on without the man who was security for this security remains to be seen. In all important matters affecting the nation he has wielded enormous influence. If the Empire has been so modernized that it can now dispense with Sir Robert Hart, it can only be because it has learned and applied the administrative lessons of his long and faithful teaching.

SPELLING REFORM IN FRANCE.

They simplify their spelling better in France. The reasons are manifold. There is a French Academy, from which all the lettered take the declaration of good usage. On the official side, the Minister of Public Instruction has great power, but he is bound to exercise it with discretion; for the good sense of the people, with their deep conservatism under surface radicalism, and their love of language as a fine art, would make it impossible to *légiférer* any sweeping changes. Thus France is guarded against the furibund and fantastic reformer of spelling; while she stands ready to hear and weigh the arguments for cautious and helpful improvement.

Matters came to a head the other day when M. Briand, the new Minister of Public Instruction, in an address before the *conseil supérieur*, took strong ground against the extremists. About two years ago it was that the question became somewhat acute. Root-and-branch reformers then first got the ear of the Ministry; and Premier Combes, with his zeal for destroying everything, saw no reason why the accepted orthography should be spared any more than the accepted orthodoxy. Under him, a commission was named to propose a plan of reform. In due time it brought out what most Frenchmen would con-

sider a monstrous scheme. By it, French would be made to read something like this:

Cète fatuité de quelques fames de la vile, qui cause en èles une mauvaise imitation de cèles de la cour, est quelque chose de pire que la grosièreté des fames du peuple et que la rusticité des vilajoizes: èle a sur toutes deus l'afectacion de plus.

And this was only a beginning. There were to be new symbols; the Greek epsilon was to replace mute "e"; there was to be a terrifying array of diacritical points, etc.

The chairman of the commission, Ferdinand Brunot, in laying his revolutionary report before Minister Briand, evidently counted upon a favorable reception. Was he not addressing a radical? Indeed, he put in some fine words about his confidence that the present Minister of Public Instruction was not a man to be frightened at the thought of "grammatical Socialism." But Briand's reply was chilly. He remarked that the innovations proposed were very "complex"; that the decisions requested of him were extraordinarily important; and that, for his part, he was not ready, until after much more study, to give his assent to changes so far-reaching. Hence the chagrin of the spelling-reformers; the joy of their opponents; the satisfaction of Academicians, who are saying that Minister Briand, in refusing to exert his official power in a matter beyond the proper competence of government, has but followed the sound example of Charles X. It was he who said, when asked to interfere with the management of the Théâtre Français, "In theatrical affairs, I have only my seat in the parterre."

While earthquake spelling reform is thus put out of the question in France, slight and sensible variations from the old orthography may be introduced from time to time. In March of last year, the Academy printed a list of about 100 words of which the spelling might be simplified, or rationalized, without incurring the anathema. Of course, the Academy never undertakes to decree; it merely registers good or permissible usage. Undoubtedly, however, its way of slow and tentative change—the new forms first knocking for admission, then being kept waiting for long scrutiny in the hall before being invited to the table with the family—is the method which is more and more approving itself everywhere as the only one by which we shall get any spelling reform at all.

Prof. W. W. Skeat's recent address on "The Problem of Spelling Reform," which has just been published by the New York branch of the Oxford Press, admits that the early schemes of Dr. Sweet and others were doomed to failure because too daring and comprehensive. "Here a letter and there a letter," is the only sure rule. Professor Skeat

naturally places great faith in phonetics. If English-speaking students were only taught to pronounce Latin correctly, there would, he believes, be more hope of their doing something for their own language. Yet even phonetics is no royal road to accurate spelling. Spanish is, we suppose, as nearly phonetic a language as exists, but its misspelling by natives is as ingenious and ludicrous as anything English can display. Under any system, some minds will remain refractory. Want of close observation, or precise hearing, or both, will make bad spellers as long as the world stands. And while habitual bad spelling indicates a certain mental defect, it is not necessarily fatal. A former Minister of Public Instruction in France, Léon Bourgeois, showed common sense in directing school examiners not to reject a student for a few errors in spelling, provided that, in other respects, he gave evidence of application and intelligence.

CANCER RESEARCH.

Progress in cancer research was announced a few days ago in dispatches from London. According to a report from Dr. Bashford, superintendent of the laboratory maintained by the Imperial Cancer Research Fund, the prospect of finding out the mystery of the disease is brighter than ever before. One of the terrible things about cancer has been the obscure nature of it. Large sums of money and much time have been spent in investigation, but the experts have thus far confessed themselves baffled. Dr. E. H. Nichols of the Harvard Medical School conducted a long series of experiments, but he succeeded chiefly in disproving several theories that had been propounded. His evidence showed, for example, that cancer was probably not, like tuberculosis, caused by a bacillus. These so-called negative results are not to be disparaged; they are really positive, and of great value in that they narrow the field of inquiry and point the way along which experimentation may be conducted most profitably.

"Four years ago," says Dr. Bashford, "there seemed little hope of acquiring any new knowledge of cancer." In the interval the advance has been so great as to enable physicians "to reproduce at will all the features of spontaneous cancer in mice and to protect healthy mice from all consequences of inoculation with experimental cancer." Without explaining the means of protection, the dispatches declare that, whereas in ordinary mice ninety out of one hundred developed tumors after inoculation, no tumors occurred in protected animals. Moreover, the body fluids of protected mice, when injected into mice with experimental cancer, have retarded the growth of well-established tumors. With thus much achieved, the outlook is that

further study "will ultimately yield results having a direct bearing on the nature and treatment of the disease." By breeding cancerous mice, it may be possible to determine whether cancer in man is or is not hereditary. Dr. Bashford, however, utters a distinct warning against exaggerated expectations. The process of retarding experimental tumors is not yet certain, "far less the cure of the disease when it occurs naturally in mice." Furthermore, the application of these methods to human patients has still to be worked out.

The brief cable dispatches do not indicate whether the report of Dr. Bashford is based on any of the experiments of Dr. John Beard, lecturer in comparative embryology in the University of Edinburgh. The work of Dr. Beard was described by Dr. C. W. Saleeby in *Harper's Weekly* of March 3. In still another article on the same subject, "Cancer: Can It Be Cured?"—printed in the August *McClure's*—Dr. Saleeby treats the topic more fully, and with still more confidence. He believes that Dr. Beard has not only come very close to the secret of cancer, but that he may actually have found in what is called trypsin a remedy.

The theory of Dr. Beard, adopted and expounded by Dr. Saleeby, is the fruit of elaborate studies of the embryology of lower orders of beings, vertebrates and invertebrates. For the full details, we must refer the reader to *McClure's*. In brief, Dr. Beard believes that cancerous tissue is the product of a misplaced germ-cell. In the case of the skate, he has found many germ-cells "lying in the tissue immediately outside the embryo and preparing to enter it." Many of these cells, however, never reach the proper position. "They wander along what is called the germinal path, but may find themselves misplaced in all parts of the body." Their common fate, he says, is to degenerate, though apparently they do not always do so. He maintains that the original cell (of bisexual origin) from which the skate develops gives rise, on the one hand to the embryo itself, and on the other to these wandering, immature, and undeveloped "twin" brothers and sisters of the embryo. "There are a host of instances in the lower animals, if not also in man, of the development of these aberrant germ-cells into tumors which show distinct signs of the attempt to produce a second individual."

These misplaced cells, survivals of a primitive state—"embryonic residues"—seem to remain dormant in the body for years, until some special cause excites them to action. Then they multiply by reproducing cells of an "extremely low order," asexual, incapable of differentiation, characteristic of part of

the structure of the embryo in an early period. In several amphibia and fishes Dr. Beard has observed that the disappearance of these rudimentary cells is determined by the development in the embryo of a new organ, the pancreas, or sweetbread. This "initiates an alkaline digestion," through which the low order of tissue—the "trophoblast"—slowly degenerates while the higher cells progress. Dr. Beard simply applies to the "irresponsible trophoblast," or the "embryonic residues," which are making cancers, the very thing that apparently breaks down such cells in the embryo, a pancreatic secretion, trypsin. His method is local application, injections under the skin, and doses through the mouth.

The results of this treatment, as Dr. Saleeby admits, are far from being well established; yet he speaks of it with the greatest enthusiasm as "the most amazing thing I have ever seen." He mentions two strikingly successful cases: in one the tumor is "killed outright"; in the other "it is expected that in a few weeks more no signs of the tumor will be discoverable." He is convinced that the method, despite important difficulties in administering the remedy, is worthy of immediate trial in behalf of persons to whom it offers a possible escape. This zeal will probably be discounted by cool observers who will note that the report from London, published weeks after Dr. Saleeby wrote the article in *McClure's*, is much more skeptical as to cures. Apparently we are on the road, but still some distance from the goal.

THE CLASSICS AND "PONIES."

An edict against "cribs"—the words "pony" and "trot" are more common in this country—has been issued by the head master of Eton. "The prose translations of the works in use for the Half have been withdrawn from circulation in the School Library"—so runs the chilling decree which has started a lively discussion among the young boys in school and the old boys now out of school and writing for the newspapers.

In all their talk there is a failure to distinguish the two different disciplines aimed at in the study of the classics. The failure is not surprising, for the disciplines are inextricably confused in the minds of many teachers of Latin and Greek. In the first place, the grammars of these languages and the texts of Cæsar and Xenophon are generally treated in practice as a mere mental gymnasium. To master the declensions and the conjugations and the rules for the ablative case and the subjunctive mood, to unravel the mysteries of $\acute{\alpha}\nu$ and $\gamma\acute{\alpha}\rho$, to construe and translate sentences—these are exercises which, like learning the multiplication table, solving problems in algebra, and per-

forming experiments in chemistry, strengthen the memory, cultivate the powers of observation, and develop the reasoning faculty. But it is nonsense to say, as enthusiastic teachers so often do, that this kind of drill-work, whether in high-school or college, gives to boys and girls a fine flavor of classical culture. Gerund-grinding may be useful enough in its way, but gerund-grinding is not reading literature with enjoyment and appreciation. Comparatively few students, even in college, go far enough beyond the rudiments to benefit from the second form of discipline; that is, to proceed rapidly, to get into the movement of an oration or poem, and to perceive that it is something more than a succession of detached and uncommonly dull sentences. The question whether our methods of instruction are faulty, we shall not discuss at length. It is enough to say that certain learned professors, through long devotion to syntax, have come to regard classical literature as nothing but illustrations of rules of grammar. Their pupils are always wrestling with puzzles in philology and sentence structure.

So long as students, young or old, are asked to approach a page of Latin or Greek, not as so much literature to be read, but as a collection of problems to be worked out, "the prose translations" are properly barred. The beginner who leans on a "pony" will not take the trouble to look up and remember words, and thus acquire a vocabulary; he will guess at meanings and he may become incurably slipshod. The objection to translations is, however, in our opinion, often carried too far. When the pupil has reached the point at which parsing ceases to be his primary aim, he may legitimately resort to translations in order to get over ground swiftly and make a complete survey of his author. This is a fact which progressive teachers are admitting far more freely than they did a generation ago. Many men of forty and fifty will probably confess that their deepest impression, say, of Flato's "Apology," is derived from a hasty—and perhaps surreptitious—reading of the whole in translation just before examination. For nearly thirty years there has been on the market an admirable translation of the "Apology," "Crifo," and parts of the "Phædo," with an introduction by Prof. W. W. Goodwin. The unnamed translator has been a benefactor to hundreds, perhaps thousands, of freshmen, who, with this little book in hand, have reinforced their knowledge of the original Greek. At Harvard some of the instructors used frankly to recommend the work, which was less expensive than the volumes of Jowett. If any of our college graduates go about their daily tasks fortified by the conviction that "no evil can befall a good man whether he be alive or

dead," the inspiration is as likely to be drawn from the printed translation as from Plato direct.

Homer, too, is an author whom many nominal Grecians must have enjoyed first and perhaps chiefly in translations—not the artificial and un-Homeric couplets of Pope, or the heavy pages of "Bohn," but the prose of the "Iliad" of Lang, Leaf, and Myers, and the "Odyssey" of Butcher and Lang; or, it may be, Prof. George Herbert Palmer's "Odyssey" in rhythmic prose. Prefixed to the Butcher and Lang translation is one of Lang's best bits of verse, ending:

So gladly, from the songs of modern speech
Men turn, and see the stars, and feel the free
Shrill wind beyond the close of heavy flowers;
And through the music of the languid hours.
They hear like ocean on a western beach
The surge and thunder of the "Odyssey."

Very little surge and thunder is there in it for most lads in high school and college. We venture, however, to say that a student who will read through a good translation may turn back to the Greek with comprehension and discover that the lines through which he had been heavily plodding are something more than a jumble from Autenrieth's "Homeric Dictionary."

Instances of this kind we might multiply indefinitely; but intelligent teachers of the classics will warn us that we are casting our pearls before Sinbad the Sailor; while the unintelligent are hopelessly wedded to their idols—the irregular verbs and the Doric forms. We would not labor the point. The judicious use of translations is, after all, one small phase of the large and pressing question of treating classics not as a cadaver for dissection, but as a living revelation of the human spirit.

THE DECISION OF CONTESTED ELECTIONS BY JUDGES.

LONDON, July 20.

The debate in the House of Commons on the conduct of Mr. Justice Grantham raises a general question, which may well interest any man who watches the tendencies of democratic government: Has the experience of England justified the system, which has now existed for some thirty or forty years, of referring the decision of election petitions to judges of the High Court? The question may be of special pertinence in the United States, where contested elections—notably the case of Senator William A. Clark of Montana and more recently that of Senator Reed Smoot of Utah—have attracted much attention, and have consumed much of the time of your legislators. The short answer to this inquiry is, that the change due to Mr. Disraeli, by which the trial of election petitions was transferred from committees of the House to the judges, has in the main turned out a striking success. The undoubted reform, however, has been accompanied by certain evils. But this reply itself requires justification.

The reform has assuredly attained its object. No one has ever expressed the remotest desire to hand back to Parliamen-

tary committees authority which in past times they often exercised with scandalous partiality, and which they could never from the nature of things exercise without some scandal. The decisions of the judges on election petitions have been accepted with general acquiescence. That the judgment of a court should give universal satisfaction is a moral impossibility. Judges are, after all, men, liable to err; but the recent debate at Westminster proves the deference felt in England for English courts, and betrays the prevalence of a conviction that judges, when trying a political issue, have not only acted honestly, but have all but invariably preserved the becoming attitude of dignity and impartiality. Electoral questions have been decided in accordance with law and not in deference to party feeling. The House of Commons has been freed from the reproach of letting the tenure of a seat depend, in appearance at least, upon the decision of a man's political enemies, or, what is equally bad, of his political friends. The reform has further made it easier to enforce a stringent law for the suppression of corruption.

Yet the change has produced two results which, if not guarded against, may become disastrous. The one is that a judge who tries an election petition is placed in a position, the difficulties of which can be met only by a magistrate of exceptional strength and wisdom. Men such as were Lord Bramwell, Lord Hannen, Mr. Justice Willes, or Lord Justice A. L. Smith—to speak only of the dead—carried with them a mass of experience and a weight of character which placed their decisions above censure and almost above criticism. Many such men always have been found, and will be found, on the Bench; but there are excellent magistrates who, though they handle satisfactorily the ordinary case, are not specially qualified to deal with a matter which excites political passions and which may touch the judge's own political feelings.

Moreover, the judge who is called upon to decide whether a candidate has by his own conduct, or that of his agents, lost the right to a seat in Parliament, must administer a branch of the law, the rules of which are singularly vague and uncertain. Nor is this vagueness accidental. Parliament and the electorate, while in their sterner moments wishing to put down bribery, have never, when in their usual frame of mind, desired to check the growth of the personal and friendly relations between a member of Parliament and his constituents. Hence the extreme difficulty of determining what is meant by "treating." Is a candidate who asks one of his neighbors, or a thousand of his neighbors, in to tea, guilty of illegitimate treating? Everything depends upon the circumstances. Parliament again has desired that a candidate should be responsible for the acts of his agents, but then Parliament has also feared that an honest man who intends no harm may lose his seat by the injudicious zeal, or even by the treachery, of a partisan who offers a bribe, say of half-a-crown, on behalf of the candidate whom he wishes to unseat. How can any judge interpret with certainty a vague enactment aiming at almost inconsistent ends?

This vagueness would be less important but for another peculiarity in the position

of election judges: they fulfil the office both of judge and jury. Hence cases which seem to the public exactly identical may rightly lead to quite different decisions. Jones, the candidate for Little Peddington, gives to a thousand electors a tea, where perhaps there is wine also. Brown, the candidate for Eatanswill, gives a feast of apparently the same kind. Jones is unseated, Brown goes triumphantly into Parliament. It is quite possible that the judges have in each case given a just judgment which, he it remembered, is also a verdict. Various circumstances which the public does not note may have made Jones's tea a case of unjustifiable treating, while Brown's tea may have been as innocent as a school feast. Further, it is more than possible that a weak or a nervous judge may think too much of public opinion, and give the decision which will commend itself to the public, rather than to his own sense of fairness.

The second danger resulting from a genuine reform is that the House of Commons may be unable to abstain from interference in judicial proceedings when they affect a right to a seat in Parliament. The recent action of the House is not of altogether good omen. The House knew that Mr. Justice Grantham had done no act which called for his removal from the bench. The House most rightly declined to pass upon him a formal vote of censure, but it would be vain to deny that the House did indirectly, but none the less certainly, criticise and in effect condemn conduct on which the House dared not pass a vote of condemnation. Many members of Parliament doubtless hoped that their action would lead to the judge's resignation; in other words, they wished, without any evidence before them which a law court would recognize, and though inevitably influenced by party feeling, to drive from the bench a man whom they felt they had no right to remove from it. This indirect supervision of judicial conduct, were it to become usual, is almost the greatest calamity which could befall parliamentary government. Reason and history alike demonstrate that a political assembly ought never to act as a law court. The House of Lords, it may be said, is an excellent Court of Appeal. The reason is that the House, long ago, surrendered its judicial functions to its judicial members. In short, recent events force the reflection that the existing method of dealing with election petitions, successful though it has been, demands the exercise of wisdom not possessed by every judge and of self-control not always to be found in every representative assembly.

INDEMNITIES FOR MURDERED MISSIONARIES.

TO THE EDITOR OF THE NATION:

SIR: The brief editorial comment in the *Nation* of July 19 on "the protest of Mrs. Mary Schaufler Laharee against the action of our Government in exacting an indemnity of \$50,000 from Persia for the killing of her husband, a missionary, by native religious fanatics," is both pertinent and wholesome. That such a "protest" is

incomprehensible to the Chauvinist, may not be gainsaid; that it also passes the recognition, if not actually the comprehension, of an unfortunately large class of our citizens, whether Christian or non-Christian, is a fact to be admitted with profound regret. It is stimulating that this instance should be duly recognized, and the *Nation* has but honored itself in honoring this good woman.

It is with no inconsiderable pleasure that I am able to submit another instance which affords a most attractive parallel to the noble action of Mrs. Labaree. This clipping from "Bulletin No. 10," Board of Foreign Missions of the Presbyterian Church, No. 156 Fifth Avenue, New York city, came to me but yesterday and tells its own story:

Four of the Board's beloved missionaries and one child were brutally massacred at Lien-chou, China, October 28—Mrs. E. C. Machle and Amy Machle, Dr. Eleanor Chesnut and the Rev. and Mrs. John Rogers Peale. Mr. and Mrs. Peale had been on the field but a day. The church supporting Mr. Peale resolved immediately to support two missionaries. The Rev. John S. Kunkle was last year appointed to Lien-chou, but, having taken the highest fellowship at the Western Theological Seminary, he was relieved of his appointment and went to study for a year at Oxford, England, Mr. Peale going to Lien-chou in his place. On receiving the news of the massacre of Mr. Peale, Mr. Kunkle offered to give up his fellowship and proceed to Lien-chou. The Rev. Ray Carter, who had just reached India, hearing of the massacre, offered to go at once to Lien-chou. A fellow-student of Mr. Peale at Princeton also offered for Lien-chou. China's challenge to the Church thus received a most heroic answer.

The Board formally voted to take no indemnity for the lives of its missionaries and no punitive indemnity whatever. The following letter from the Chinese minister was read at the meeting of the Board on December 4:

"Imperial Chinese Legation,
Washington, November 23, 1905.

"Rev. Arthur J. Brown, D.D., Sec. Board of Foreign Missions of the Presbyterian Church in the U. S. A., 156 Fifth Avenue, New York:

"Dear Sir: I have just read your letter of the 22d instant, in which you are so kind as to communicate to me the views of your Board on the question of indemnity arising from the killing of your missionaries at Lien-chou, China. I note with special gratification that it has been unanimously decided by your Board not to ask for or receive indemnity of a punitive character. I have lost no time in advising my Government of the conciliatory stand taken by your Board in this matter, which I am sure, will be greatly appreciated by my Government as it is by myself.

"I have read with profound interest the extract from a letter recently received from the Rev. John Rogers Peale, one of the murdered missionaries. His words seem to me to have a prophetic ring. In his untimely death America has lost a noble son and China a true friend.—Very truly yours,
(Signed)

"CHENTUNG LIANG CHANG."

NORVELLE WALLACE SHARPE.

St. Louis, July 26, 1906.

SUMMER SCHOOL OF FRENCH AT MCGILL UNIVERSITY.

TO THE EDITOR OF THE NATION:

SIR: The Summer School of French at McGill University closed yesterday, after a session of three weeks. These vacation courses are not so well known in the United States as they deserve to be. They were instituted two years ago, primarily for the benefit of teachers of French in the Prov-

ince of Quebec, where the large French population gives to the knowledge of French much practical importance. But they are open to all who have some acquaintance with the language. There are two sets of courses, elementary and advanced. Instruction is given entirely in French (except just at the beginning of some elementary work), and French is the mother tongue of the whole faculty. Moreover, all the students in the boarding department are required to use French in conversation. The courses include conversation, composition, reading, phonetics, literature, etc.

Towards the end of the session free examinations are held, to which all students are admitted who wish to test their attainments. The Alliance Française of Montreal offers each year two bronze medals as prizes for the best examinations. Expenses here are very moderate, \$6 a week for board and lodging. The fee for all the instruction, lectures, and entertainments is \$10.

HERBERT M. CLARKE.

Presbyterian College, Montreal, July 26.

Notes.

"It is not generally known," say the Funk & Wagnalls Company, "that William Jennings Bryan is a prodigiously industrious literary worker, even while on his travels!" McClure, Phillips & Company have already announced that Mr. Bryan sent them from Suez the MS. of a reply to the "Letters from a Chinese Official," in the form of letters to that friend of the Orient. Now Funk & Wagnalls announce two more works. One is to be his travels, with comments on what he saw, his syndicated articles, no doubt. Besides this, he is to edit, with the assistance of Francis W. Halsey, "The World's Greatest Orations," in ten volumes. This huge work is to include the eloquence of mankind from the days of Athens down through, we presume, two notable recent Presidential campaigns.

F. Berkeley Smith's new book, "In London Town," will come from the Funk & Wagnalls Company's press in September.

"The Heart that Knows," by Prof. C. G. D. Roberts, will be the most important piece of fiction on the fall list of L. C. Page & Co. The tale deals with the fisher and sailor folk of the Tantraman Marsh region about the head of the Bay of Fundy.

E. P. Dutton & Co. announce for immediate publication a new volume by Madison Cawein, his first prose work, called "Nature Notes and Impressions." The book consists of moods, fancies, descriptions, with occasional bits of verse, jotted down among woods and fields.

Moffat, Yard & Co. announce as forthcoming a popular work on wireless telegraphy by Prof. A. E. Kennelly of Harvard.

Philipp Spandow, the popular author of "Tyrann Ich!" is hard at work in his summer home near Berlin on a new work, "Ibsen und Idealismus," which he began shortly before the death of the great dramatist.

Henry Holt & Co. announce for the early fall a novel, "In the Shadow of the Lord,"

by Mrs. Hugh Fraser. Mary Washington, mother of George, is the central figure. The same firm will soon issue two text-books: "Everyday Ethics," by Mrs. Ella Lyman Cabot, and McMullen's "Forty Lessons in Physics."

Doubleday, Page & Co. will open their fall publishing season on September 6, with the "Dog Book," in two large volumes. Other books to be brought out on this day are a political novel, "The Leader," by Mary Dillon; "Songs Every Child Should Know," edited by Dolores Bacon and illustrated by B. Ostertag; "Dixie After the War," by Myrta Lockett Avary, uniform with "A Belle of the Fifties" and "A Southern Girl of '61."

Houghton, Mifflin & Co. announce for publication in the autumn: "John Sherman," in the American Statesman Series, by Congressman Theodore E. Burton of Ohio; and "Ecclesiastes in the Metre of Omar," by the Rev. William B. Forbush, D.D., who has just left the Madison Avenue Reformed Church, New York city, to accept a call to the Woodward Avenue Presbyterian Church in Detroit.

Harper & Bros. announce for autumn publication five novels: "The Call of the Blood," a story of Sicily, by Robert Hichens; "By the Light of the Soul," by Mrs. Mary E. Wilkins Freeman; "Ann Boyd," the scene laid in North Georgia, by Will N. Harben; "The Trident and the Net," a tale of Breton life, by the author of "The Martyrdom of an Empress," and "Sophy of Kravonia," by Anthony Hope Hawkins. The firm will also issue "Certain Delightful English Towns," a companion volume to "London Films," by William Dean Howells; "The Americanism of Washington," by Dr. Henry van Dyke; the autobiography of Gen. Lew Wallace; and "A Japanese Blossom," by Onoto Watanna.

A. C. McClurg & Co. are reprinting in handsome form (the Merrymount Press does the work) six rare books of the seventeenth and eighteenth centuries on libraries and their management. They will be in English, several of them appearing here for the first time in translation. Two volumes are now ready: "Concerning the Duties and Qualifications of a Librarian," by Jean Baptiste Cotton des Houssayes (1727-1783), and "The Reformed Librarian-Keeper," by John Dury (1596-1680). The other four volumes, to appear later, are: "An Overture for Founding and Maintaining of Bibliotheks in Every Paroch Throughout This Kingdom," by the Rev. James Kirkwood (1650-1708); "De Bibliothecis Syntagma," by Justus Lipsius (1547-1606); "Life, Written by Himself," by Sir Thomas Bodley (1545-1613), and "News from France; or A Description of the Library of Cardinal Mazarini," by Gabriel Naudé (1600-1653). The whole series is edited by John Cotton Dana, of the Newark Public Library, and Henry W. Kent, librarian of the Grolier Club.

In John Murray's autumn list we note the following titles: "The Army in 1906," by H. O. Arnold-Foster; "Moltke in his Home," by F. A. Dressler, translated by C. E. Barrett-Lennard; "Life and Works of Vittorio Carpaccio, by the late Prof. Gustaf Ludwig and Prof. Pompeo Molmenti, translated by R. H. Hobart Cust; "Queen and Cardinal: A Sketch of the Life

and Companions of Anne of Austria," by Mrs. Coloquhoun Grant; "Recent Advances in the Study of Variation, Heredity, and Evolution," by Robert H. Lock, M.A., fellow of Gonville and Caius College, Cambridge; "Storia Do Mogor: or, the Mogul Memoirs (1653-1708)," by Niccolao Manucci, Venetian, translated and edited—under the supervision of the Royal Asiatic Society—by William Irvine, late of the Bengal Civil Service; "The Industrial Organization of an Indian Province," by Theodore Morison, formerly principal at the College of Aligarh; "An Idler in the Wilds," a new volume of essays on bird life, by Tickner Edwardes, illustrated by the author; and two companion series of lectures—to be published for the League of the Empire—entitled "Colonization and Empire," by F. A. Kirkpatrick, M.A., university extension lecturer; and "Empire Builders," by the Rev. W. K. Stride.

Prof. C. E. Norton sends us this correction of the review of Baumgarten's "Carlyle and Goethe," printed in the *Nation* of July 19:

In 1887 I edited, and Macmillan & Company published, the "Correspondence between Goethe and Carlyle," printing the letters of Goethe in their original German and accompanying them with a translation. As an appendix, I printed a translation of the Dedication and Introduction by Goethe to the German translation of Carlyle's "Life of Schiller." The translation had been made under Goethe's auspices. One might infer from the reviewer's words that an Introduction in German by Goethe had been printed in an edition of the "Life of Schiller" in English, and that there were letters by Carlyle, written in German, given in the Introduction, as well as letters by Goethe. This is not the case. In the course of the Introduction Goethe gives a translation of a part of three of Carlyle's letters, but there is no letter of his own.

We have received from F. Gutekunst, Philadelphia, an admirable photograph of the late Carl Schurz. It is obviously an enlargement from one taken when Mr. Schurz was at the height of his physical and mental activity. Yet the one criticism would seem to be an appearance of whiteness about the beard and hair. At his death Mr. Schurz had extraordinarily few gray hairs. In other respects this likeness is characteristic and faithful to such a degree as to make it in our opinion the best of the existing pictures of this remarkable man.

The *Atlantic Monthly* for August opens with a story by Norman Duncan, "The Wayfarer," the scene of which is laid on Mr. Duncan's favorite coast of Newfoundland. Admirers of Emerson will be interested in some three pages, probably once part of a lecture called "The Poet," devoted to Father Taylor, the "Sailor Preacher." Stoddard Dewey sums up the political events of the year in France; Henry Dwight Sedgwick offers an elaborate criticism of the novels of Mrs. Wharton, and Prof. A. Lawrence Lowell reviews Winston Spencer Churchill's Life of his father, Lord Randolph Churchill. Wendell Phillips Garrison, in an instructive and entertaining paper, "A Dissolving View of Punctuation," treats of punctuation as a fine art. With a conviction born of long experience in editing copy he exclaims: "How many graduates of our colleges, of both sexes, betray in their manuscripts no evidence of their literary training! How many writers of

learning and distinction need to be edited for the press in the simple matter of punctuation! Our textbooks are palpably at fault—our elementary textbooks; for the study ought never to pass beyond the grammar school."

Northern art bulks large in the *Burlington Magazine* for July. A summary account is given of the finest pieces—in Oiron pottery, ivory, enamel, and crystal—in the Oppenheim collection, which J. P. Morgan has recently acquired. W. H. J. Weale completes his critique of Netherlandish art at the Guildhall. Lionel Cust, Aymer Vallance, and Charles Ricketts discuss various phases of early German art, apropos the current exhibition by the Burlington Fine Arts Club. In "Austrian Colored Pottery of the Renaissance," M. L. Solon introduces a novel subject. The ware, as a colored frontispiece attests, has a curious similarity to Palissy faience. Stoves, frequently of belated Gothic design, are the occasion for the most striking display of tile work. C. J. Holmes continues his stylistic and chronological survey of "Rembrandt as an Etcher," this time dealing with the much disputed prints that fall between 1630-1636. In the American section is a capital reproduction of Botticelli's "Lucretia," in Mrs. John L. Gardner's collection, with an aesthetic appreciation of Botticelli's late manner by William Rankin.

A Fritz Reuter Museum is to be established in Mecklenburg, the birthplace of the great Low-German humorist. The prime mover is the Reuter savant, Professor Gaedertz of the University of Greifswald. The collection of Reuteriana found in Eisenach, where Reuter died, is to be transferred to the new museum.

The new "Allegemeine Deutsche Universitäts- und Hochschul-Kalender," issued by Otto Schroeder, Secretary of the University of Rostock, gives full reports of all the universities, technical institutes, veterinary schools, agricultural colleges, schools of forestry and of mining in the Empire. Among the novel features of this issue for the summer semester of 1906 is the report of the salaries paid the docents, lecture fees, and full statistics of attendance.

In connection with the celebration in the autumn of 1910, of the first centennial of the establishment of the University of Berlin, a monument will be erected to Fichte, who was the first rector of the institution. A committee has been appointed, consisting among others of the Chancellor von Bülow, the Ministers Studl, v. Einem, and Althoff, the Lord-Mayor of Berlin, and the Senior of the University, Professor Zeller. Contributions are now being received by the Deutsche Bank of Berlin and its branch houses at home and abroad.

King Oscar of Sweden and the Swedish Academy are at sword's points. The Academy has only eighteen members. Vacancies caused by death are filled by the votes of the survivors; and membership is the highest honor which can come to a Swedish professor. Last year there died the aged Professor Ljunggren, known for his studies in the history of literature. To succeed him the Academy chose, by a vote of twelve to five, Professor Henrik Schück of

the University of Upsala. To the astonishment of everyone, King Oscar has refused to sanction this choice, on the ground that Prof. Schück, in his well-known life of Gustav III., sinned in failing to take the conventional and official view of this Swedish hero. The fact that Prof. Schück's book found instant recognition at home and abroad is of no weight; he is to be punished for exercising the inalienable privilege of the historian. Learned circles in Sweden and Norway are wondering what action the Academy will take in defence of its freedom of choice.

The "Etymological Dictionary of the Norwegian and the Danish Languages" by Hjalmar Falk and Alf Torp, the first part of which appeared in 1901, published by H. Aschehoug & Co., of Christiania, has just been completed in twelve parts. Both authors are professors in the University of Christiania, and the work throughout bears witness to their comprehensive learning. The greatest unevenness is observable in the treatment of the so-called "foreign" words. Thus of the four words *alkali*, *alkimi*, *alkohol*, *alkove*, the dictionary omits *alkohol*, easily the most important of the group. In spite of some shortcomings the work is a welcome addition to the library of any student of Germanic philology.

John Wellesley Russell's "An Elementary Treatise on Pure Geometry, with numerous Examples" (Oxford: Clarendon Press), is a good book. It first appeared in 1893, and this is a new and revised edition.

Prof. J. Cook Wilson's "On the Traversing of Geometrical Figures" (Clarendon Press) is about that schoolboy's puzzle of drawing a figure without removing the pencil or going over a line twice. The book is not particularly clever. The subject forbade that. Yet it may amuse some hours.

Dr. Charles C. Bombaugh's "Facts and Fancies for the Curious" (Philadelphia: J. B. Lippincott Co.) is much like his larger and long-popular "Gleanings for the Curious from the Harvest Fields of Literature." A small percentage of its matter is, indeed, substantially contained in that uncritical patchwork.

Prof. E. B. Titchener's "Experimental Psychology" consists, nominally, of two volumes, but really of four; Vol. I., Part i.; Vol. I., Part ii.; Vol. II., Part i.; Vol. II., Part ii. The first part of each volume is for the student, the second for the instructor. The second volume, now sent us by the publisher (The Macmillan Co.), is not for general reading, but for study and reference, preparatory to experimentation. It is from experiments, and not from the book, that the science of psychology is to be acquired. This plan of instruction has here been worked out so carefully that the book is likely to be used in every laboratory where modern psychology is taught.

Dr. Charles Emerson Curry's "Electromagnetic Theory of Light" (The Macmillan Co.), of which Part I. is before us, is a clear mathematical development, according to the views of Maxwell, of the theory of light, in so far as Maxwell's theory seems to meet the facts. It is promised that Part II. shall take up the theory in so far as it seems to require modification. The student is supposed to be acquainted with the theory of electricity and magnetism in

the familiar form in which it is presented in the author's treatise on that subject. The work is purely theoretical, and in some chapters has no obvious pertinency to known facts.

The translation of Drude's "Textbook of Optics," which was published four years ago under the auspices of Michelson, improved upon the original title by calling itself "The Theory of Optics." For, admirable as the presentation of the theory therein is, the experimental side was almost entirely left for the laboratory. Two years later came Schuster's volume, two disconnected books pagged and bound as one. This was of considerable avail, and yet insufficient. Prof. Robert W. Wood of Baltimore now gives us a treatise entitled "Physical Optics" (The Macmillan Co.). Such a work cannot have been begun and completed within four years; yet it would not have been very different if Professor Wood had proposed to himself to fill the lacuna left by the Drude translation and by Schuster's "Introduction to the Theory of Optics." It is full of instruction clearly conveyed, is instinct with intelligence, and is uncommonly interesting, because it is largely about the author's own work. Some day we shall have a better proportioned book, but that it will be a more serviceable one is not so certain.

George P. Humphrey of Rochester has published, in an attractive pocket edition, Field Marshal Viscount Wolseley's tribute to Robert E. Lee, which originally appeared in *Macmillan's Magazine* for March, 1887. Lord Wolseley writes as an eye-witness of some of Lee's operations, and he shares to the full the Southern pride in the most attractive personality of the Confederacy. The edition is limited to 300 copies.

"Whistler and Others" (Scribners) is a collection of twenty-four essays or notes by the veteran editor and print collector, Frederick Wedmore. When Mr. Wedmore discourses on modern prints, as he does in some half a dozen instances, he speaks with much authority. No one who follows his advice in making an anthology of Whistler, Seymour Haden, or David Lucas will go seriously wrong. The discussion of artistic lithography under Whistler, Fantin, etc., may also be useful to the layman. It was, however, an error of taste to pad the volume out with trifling notes which may have served well enough to introduce a temporary exhibition or to characterize a single painting. Such observations as those on Goya, Romney and Lawrence, Watts, Ety, Large Water Colors, and half a dozen similar subjects are simply too slight to claim the honors of large type and buckram. Possibly Mr. Wedmore's rather didactic manner has imposed upon himself. Throughout these papers he has a little the air of a man doing a painful duty imperturbably. In a preface which is the most interesting part of the volume, is discussed the perennial topic of British indifference to art and its criticism. May not the reason be that there is so much merely nugatory writing on these subjects, in which a little special knowledge is made to take the place of accurate appreciation and general ideas?

Two German Rembrandt scholars, W. R. Valentiner and J. G. Veldheer have compiled a kalender for the memorial year

1906: "Rembrandt zu seinem drei hundertsten Geburtstag" (Amsterdam: Meulenhoff & Co.; Leipzig: K. F. Koehler). The table for each month is adorned by a line print of some building associated with Rembrandt's life, while the events that befell him in the month are duly noted in brief. Thus we learn that on March 19, 1659, his collections were appraised at 17,400 florins, while on March 22, 1669, his grandchild Titia van Rijn was baptized. The usefulness of such an array of facts out of chronological order is doubtful. There are, however, an excellent biographical and critical essay, and some twenty-seven well selected illustrations, besides facsimiles of the artist's handwriting. The book is a thin folio, attractively printed, and is quite worth the while of the Rembrandt lover. Lemcke & Buechner are the American publishers.

Ernest Ingersoll's "The Life of Animals: The Mammals" (The Macmillan Co.) is a popular natural history of mammals. In the treatment of this large subject, Mr. Ingersoll follows the accepted classification, and arranges the groups in systematic order, beginning with man and the apes, and concluding with the curious prototheria, the ornithorhynchus, and spiny ant-eater. Two only of the fifteen orders have received scanty notice, the cetacea (whales and allies) and pinnipedia (seals, etc.); the remaining thirteen are fully treated, and the relationships, distribution, and life habits of the diverse members are well discussed. The text is not confined to the animals now living but much has been added regarding those of bygone ages, known to us only by fossil remains. The book is well illustrated. In addition to fifteen full-page colored plates, there are 257 text figures and uncolored plates, many of them half-tones after excellent photographs from life. An interesting feature of the volume is the large number of well-selected quotations which give from leading authorities first-hand information concerning many animals. The text proper is supplemented by a bibliography in which 270 works are cited, and an index of authorities and subjects.

A sketch of the public life of R. M. T. Hunter, by D. R. Anderson, and a series of articles severely criticising Marshall's opinion in the case of Cohens vs. Virginia, contributed to the *Richmond Enquirer* in 1821 by Judge Spencer Roane, form vol. ii., No. 2, of the "John P. Branch Historical Papers," edited by Prof. W. E. Dodd of Randolph-Macon College. The biography of Hunter is not particularly important; the Roane papers, on the other hand, though discursive, rhetorical, and vehement, are valuable as showing the bitter hostility of the Virginia State-rights men to the Supreme Court and to the national theories which Marshall was expounding. The articles now reprinted supplement the account of Roane's life, in the "Branch Papers" for 1905.

Under the title of "Man, the Social Creator" (Doubleday, Page & Co.), Misses Jane Addams and Anne Withington have put together, mainly from unpublished papers and memoranda, the material for a work on religion which the late Henry D. Lloyd had long had in preparation. Naturally, the treatment is somewhat fragmentary and at times vague; as a whole, however, the editors have succeeded in giving to

the exposition both symmetry and connectedness. The author's aim, apparently, is to show in contemporary society the growth of religious ideas and the influence of the religious motive. Present-day religion, with him, subsists in "social love"—in the dependence of man upon his fellows, and the mutual obligations and rights arising from common social relations. Social progress, accordingly, is always religious, because the root of progress is love; even mere social contact makes for spiritual union. "Social love," further, creates new forms of social life, such as coöperation and communism, and a new "social conscience," by which industry, politics, and education are eventually to be transformed. Religion, in other words, is not conventional belief in God, nor yet a philosophy of life based on the acceptance of divine elements in the world, but social altruism founded on labor. All this, of course, is not novel. It does not differ much, at bottom, from the conception of religion as, historically, whatever at any time has most inspired men and determined their conduct. To revolutionary France, the revolution was religion; to the twentieth century world, still mainly dead in trespasses and sins, the true religion is work, social service, combined effort for the common good. Readers of the author's "Wealth against Commonwealth" will expect to find here abundant exhortation of the evils of capitalism, merciless exposure of the sores of modern society, and outspoken criticism of the church; but the book, as a whole, contains deeply suggestive writing in a style which curiously recalls both Emerson and Carlyle. It is a pity that the proofreading should have been so wretchedly done.

A work on Biblical criticism ("Der vorgeschichtliche Jesus"), by a professor of mathematics (at Tulane University), is a somewhat unexpected phenomenon. When we add that the author is an American, William Benjamin Smith, whose name bespeaks unmistakable English origin, and that the book is written in German, and published by Alfred Töpelmann of Giessen, it will be seen that it is phenomenal in more ways than one. Professor Smith writes of himself: "My vocation is mathematics, my avocation is theology." This is his first book on theological themes, but in the *Journal of Biblical Literature* and elsewhere he had already published half-a-dozen articles dealing with questions of New Testament criticism. The theme of this book is substantially that Jesus Christ is, for all intents and purposes, not an historical character; that the name Jesus and the doctrine of Jesus are older than the supposed historical personage with whom they were brought into connection at a later date; that the Jesus of this doctrine was from the outset nothing other than a divinity, who was regarded as Saviour, Protector, or Deliverer; that this is the meaning of the name Nazarene, a name used long before the time of Christ (he brings it into connection with the Assyrian *na-za-ru*), which was afterwards connected with the name of a town, which town, however, did not exist at the time of the birth of the supposed historical Jesus; that this Jesus cult was an extra-Judean esoteric doctrine, with which the Judæan conception of

Christ was brought into connection, forming the complete Jesus-Christ. Professor Smith rightly says that his results will be as amazing to the most radical critics as to the most conservative theologians. The method which he pursues is the very negation of criticism, and in results and methods, to use a phrase which Biblical scholars will understand, he "out-Jerahmeels Jerahmeel."

Classical and Oriental scholars will be much interested in Prof. W. M. Ramsay's monograph on Neo-Phrygian inscriptions. Attention was first drawn to this class of inscription by Mordtmann: *Münch. Sitzungsberichte*, 1862, p. 12. He believed them to be Armenian. Moritz Schmidt, in 1869, was the first to see that they were in a language akin to Greek and to recognize in some of them a formula of execration in the Phrygian language. Eighteen years later, Professor Ramsay collected twenty-nine Phrygian inscriptions. He inferred what subsequent discoveries prove correct, *i. e.*, that the inscriptions were not survivals from ancient and sacred formulæ, but that they sprang from a living language spoken by a non-Christian population, not in the great cities, where Greek-speaking Christianity had penetrated, but in rural districts, *e. g.*, that to the east of Apollonia and round Antiocheia Pisiðia, which other remains show to have been among the most uneducated in Phrygia. Few groups of inscriptions have come down to us so worn or with so uncertain a text as these late Phrygian epitaphs. It was not till last year that Professor Ramsay lit upon three perfect and practically certain examples, along with two of the usual mutilated kind, in a village near the centre of the Axylon. These five are discussed at length in the present monograph. Their date cannot be accurately determined. Probably they fall between 120 and 240 A. D. Professor Sayce, who examined copies of them, contributes many notes and suggestions. Besides this group he interprets other inscriptions, copied in the last twenty years, by Messrs. Anderson, Hogarth, Radet and Ouvré, Legrand and Chamonard, Wilhelm and Heberdey. This paper appeared in the "Jahreshefte des Oesterreichischen Archæologischen Institutes," Band viii., 1905, and is now issued separately. It is a report for the Wilson fellowship in Aberdeen University.

Edith Wynne Matthison has been engaged to play Brangwaine in Comyns Carr's "Tristram and Iseult" in London.

J. K. Hackett has decided to give his own name to the Lew Fields Theatre, of which he has become the manager. He will open it on August 27 with Michael Morton's farce, "The Little Stranger," which was popular with the crowd in London, although some of the best critics treated it with contemptuous severity.

There has been a misunderstanding in the matter of the new play for Eleanor Robson by Edmond Rostand. The play, as a matter of fact, is our old friend "La Princesse Loïtaine" in a new version, specially devised, with the consent of M. Rostand, by that adroit artificer, Louis N. Parker, for Miss Robson.

Mario Majeroni has been engaged to play the leading character in the spectacle, "The Prince of India," which is to be presented in the Broadway Theatre at the end of September. The young man has never been seen on the New York stage, although he is said to have made a favorable impression both in the East and West by his performances in the company of Nance O'Neil. He is the son of the Signor and Signora Majeroni who came to this country with their famous aunt, Ristori, and who will be remembered by old playgoers as actors of uncommon skill and power.

William H. Crane is to open his season in the Garrick instead of the Savoy Theatre. He will be seen at the former house in "The Price of Money" on August 29. Henrietta Crosman will open her season in "All-of-a-Sudden Peggy," the piece which Ernest Denny wrote for Marie Tempest and which had a long run in London. She hopes that this will last until she is ready to present her dramatic version of "The Pilgrim's Progress." J. E. Dodson has been engaged to take a leading character part in the new play written by Clyde Fitch for Clara Bloodgood. Blanche Walsh, it is announced, will be seen as Lady Macbeth next season in a spectacular revival of the Shaksperian tragedy to be made at the Astor Theatre.

John Lawrence Toole, who died in England Monday, was for years the favorite low comedian of the British public. Outside the British Isles he was little more than a name. Both his humor and his pathos were of an exclusively insular type, admirable of their kind, but not likely to be appreciated beyond their natural boundaries. He was not a great actor, but he had a copious vein of broad humor, a merry eye, and a marked capacity for comic exaggeration. Later in life he acquired notable ability to express the simplest forms of pathos. Born in 1832 he began acting in youth as an amateur, but became a professional in 1852. In association with Henry Irving and Helen Faucit, Mr. Toole in his early days performed in many of Shakspeare's plays. In 1862 he made a hit as Caleb Plummer, in "A Cricket on the Hearth," and he was successful in similar plays in which broad humor and simple pathos or passion were blended in almost equal quantities. In this country, which he visited thirty years ago, he had a chilling reception.

As usual at this time of year, Charles Frohman has published a summary of the theatrical bill of fare which he has prepared for the New York public next winter. The document is significant as showing what a large proportion of the amusements of the English-speaking world is provided through a single agency. This enterprise might be a tremendous influence for good if it were conducted with any definite purpose besides financial profit; but it takes no account of any quality in play or player except "drawing power." Nevertheless there are pleasant and interesting features in his programme. One of the brightest is the promise of Ellen Terry's return. In A. W. Pinero's "House in Order" Mr. Frohman is assured of a certain amount of success by the repute of the author and the popularity of John Drew, who is to play

the leading part. The piece itself, according to the best London opinion, is an admirable specimen of Mr. Pinero's handiwork, with much clever characterization, smooth and effective machinery, and excellent dialogue. In England it was the play of the season, and is still running in London to crowded houses. The announcement that Henry Arthur Jones is writing a new comedy for Francis Wilson may or may not be important. It all depends upon whether it is to be a bit of theatrical tailoring, or not. Good entertainment, of one sort or another, may be looked for in the promised new comedies of J. M. Barrie, Augustus Thomas, George Ade, and Capt. Marshall. "Book plays" are nearly always unsatisfactory, but a dexterous stage carpenter like Clyde Fitch, and so clever an actress as Fay Davis, ought to be able, between them, to make something worth while out of "The House of Mirth."

Four of Bach's best church cantatas have just been issued with English texts by Novello, Ewer & Co.

Berlin is looking forward to a visit from Saint-Saëns as the greatest event of the coming season. He will appear at the first of Nikisch's Philharmonic concerts.

The American Organ Players' Club has, during its fifteen years' existence, given 300 free recitals in Philadelphia, playing during that time the entire organ works of Bach, Mendelssohn, Rheinberger, Handel, and Guilman.

The second July number of *Die Musik* is devoted to Schumann. It includes, with other good things, some heretofore unprinted aphorisms; among them: "There were at all epochs bad composers and fools to praise them." "If you are asked to play, do so at once or refuse firmly."

The Festhalle which is to be erected at Frankfurt for the competitions of German vocal societies will be the largest music hall in the world. There will be 25,000 seats, and room on the stage for 4,000 singers. The cost of the building will be about \$1,000,000. It was at the Kaiser's suggestion that it was planned.

Among the new inventions shown at the recent musical exposition in Berlin was one by Frau Antoinette Arntzen—a method of increasing the resonance of the voice by inserting a film under the roof of the mouth, making a sort of sounding-board. The apparatus is intended for the use of orators, officers, sea captains, etc., as well as for singers.

Inasmuch as Dr. Carl Muck has signed a new contract with the Royal Opera at Berlin, beginning in the autumn of 1907, he will not, in any case, preside over the Boston Symphony Orchestra more than one season. Although Dr. Muck will come to America with an experience of twenty-five years, his activity has been confined almost entirely to the opera house. His Boston engagement will give him his first opportunity as a conductor of high-class symphony concerts. In Berlin circles opinions vary as to the success he will achieve.

Karl Goldmark has completed two acts of his new opera, "The Winter's Tale," but, being a slow worker, he does not expect to have the score ready for performance before autumn of next year. The opera

will contain two independent orchestral numbers, serving as contrasting introductions to the first two acts. He expects to complete the sketch of Act III. this summer and then to take up the work of orchestration, which will require much time. Although Goldmark is seventy-six years old, he says he thoroughly enjoys the labor of composing.

In an article on Weber by Gehrmann, printed in No. 18 of *Die Musik*, there is an interesting extract from a letter written by Weber to Kapellmeister Praeger of Leipzig: "There is no slow movement in which there are not passages calling for a faster pace. There is no presto which does not on the contrary demand a retarding in various places, to prevent the impression from being spoiled by precipitation." When Richard Wagner wrote his essay "On Conducting," of which this same doctrine forms the central idea, there was a great outcry among the pedants; but at present the musical world has accepted the doctrine of Weber and Wagner as the cardinal point in musical expression.

The latest contribution to the interesting subject of genius and insanity is a book by Professor Möbius of Leipzig on Robert Schumann's illness. He calls the disease from which that great man suffered *dementia præcox*, and feels sure that it had nothing to do with paralysis, but was an inherited evil, which was bound to show itself sooner or later. The disease was not caused by hard work, but was in all probability accelerated by it. The various symptoms—his fits of silence, his continued melancholy, his dissatisfaction with his work, his frequent inability to compose—were all to be noticed twenty years before the day on which he threw himself into the Rhine.

Italy's leading opera house, the Scala of Milan, is again facing a crisis. The expenses of a four months' season of opera amount to about \$200,000, while the receipts do not exceed \$120,000. This leaves \$80,000 to be supplied by the owners of the opera house—the city and the boxholders. In 1901 the citizens of Milan decided, by a referendum, not to cover the annual deficit any longer. Luckily, a syndicate named "Pro Scala" succeeded in tiding over the difficulty; but only for a few years. The city is again asked to contribute its share, being part-owner of the theatre, but the referendum decision stands in the way. It is feared that the Scala will again have to be let year by year to some speculative manager.

In a late issue of the *Bayreuther Blätter*, Dr. B. Hoffman had an article on the bird music in the second act of "Siegfried." He attempted to prove that Wagner made artistic use therein of the song of four different kinds of birds, including the nightingale. Concerning Wagner's love of the nightingale, an interesting anecdote is related in a more recent publication, "Bayreuth vor dreissig Jahren." The author of this, Richard Fricke, had a friend who was very eager to attend some of the Nibelung rehearsals in 1876. This friend, Dr. Baldamus, had been remarkably successful in acclimating nightingales and other birds in Koburg. Fricke, who knew this, informed him that there was a rigid

rule against the admission of laymen to the Bayreuth rehearsals, but that he would nevertheless be sure to get in if he promised Wagner that nightingales should sing in his garden in two years. The doctor followed his advice, and Wagner exclaimed enthusiastically: "If this man brings nightingales into my garden, he shall attend all the full rehearsals this year and next!"

Reference was made in these columns recently to the remarkable results achieved in Canada by the musical missionary, Dr. Harriss. Similar work is being done in the State of Maine by William R. Chapman, whose festivals are the great musical events of each year. Under various local conductors he has at work a chorus of nearly 3,000 singers. Mr. Chapman lives in New York, where he conducts the Apollo and the Rubinstein clubs; but at regular intervals he visits his choirs to keep things running smoothly. The Eastern division of his large chorus holds its festivals in Bangor, the Western division in Portland. Among the great singers who have assisted at these festivals are Eames, Nordica, Sembrich, Gadski, Schumann-Heink, Blauvelt, Ffrangon-Davies, Campanari, Bishopham. Among the choral works performed in the last nine years are "The Messiah," "Elijah," "The Creation," "The Redemption," "Stabat Mater" (Rossini), "Requiem" (Verdi), "St. Matthew's Passion," "Tower of Babel," etc. Ever since the days of Anton Seidl Mr. Chapman has furnished the chorus for the concerts of the New York Philharmonic Society. A full account of his activity is given in the Boston *Musician*.

SIR WALTER BESANT'S LONDON.

Medieval London. Volume I.: Historical and Social. By Sir Walter Besant. London: Adam & Charles Black; New York: The Macmillan Co. \$7.50 net.

This large and sumptuous volume is an instalment of Sir Walter Besant's great undertaking, to which he gave the name, borrowed from Stow, "The Survey of London," a title somewhat inappropriate in the case unless we allow a very extended meaning to the word "Survey." We should have said, to be exact, that the volume is part of an instalment, for it will be followed by a volume on "Mediæval London—Ecclesiastical," completing this section. As the publication of the divisions follows no chronological order, it may be as well to set down what has been accomplished, and what is projected. In 1902 was published "London in the Eighteenth Century." This was followed by "London in the Time of the Stuarts" (1903); "London in the Time of the Tudors" (1904). The two volumes on "Mediæval London" are to be followed by one on "Prehistoric Saxon and Norman London." Then is to come a volume on "The City," and the work will be completed by one or two volumes of "Perambulations"—a "Survey," it may be presumed, in a restricted sense. Thus the whole "Survey" will occupy eight or nine volumes.

This is a gigantic work, which might well have employed the great part of a lifetime. Before his death, in 1901, one or two monographs by the author on London subjects had been published. No mention is made in the present volume of

an editor, and it is understood that the "Survey" was practically completed when Sir Walter Besant died. The execution of "Mediæval London" is unequal. Of its two divisions, "Mediæval Sovereigns" and "Social and General," the former seems the less finished; but parts of the whole volume are suggestive rather of a collection of materials than of the production of a literary artist. The volume shows, as might have been confidently expected, full acquaintance with all sources of information as to Mediæval London. The author has drawn upon the old chronicles, and has, besides, made effective use of the late H. T. Riley's "Memorials of London," as well as of his work in illustration of the rich collection of documents in the possession of the Corporation of the City of London, as *Liber Albus*, *Liber Custumarum*, *Liber de Antiquis Legibus*, *Liber Horn*, and the *French Chronicle*. The works of Dr. Reginald Sharpe have not been overlooked, nor Professor Skeat's monumental edition of Langland's "Piers Plowman."

The chapters "Social and General" are at the same time the more finished and the more generally interesting. To take one point only. The author tells us that there were, between 952 and 1665, no fewer than twenty outbreaks of pestilence in London. But, on reading of the insanitary conditions of life, one wonders that London was not even more frequently ravaged by the plague. Since Roman times the level of the surface of London has risen by twenty feet, and one shudders to think of the nature of this deposit. Sir Walter Besant writes:

The greatest difficulty of cities has always been the disposal of waste matter, solid and liquid. For nearly two thousand years the lower part of the city, the most densely populated part, was dotted with latrines and cesspools. The whole soil of the city was soaked and permeated and corrupted with the pestiferous stuff; the ground gave off a poisoned breath. When the plague came, this poison encouraged it, helped it along, spread it, and strengthened it. We have had no plague for more than two hundred years. Perhaps the reason has been that the fire of London in 1666 not only baked and calcined the ground with its heat for many feet deep, burning up the dead bodies which rested three or four feet below the surface, with the coffins, bones, and deadly poisonous soil of the churchyards, but also choking up the city wells—which were never again opened—and burning the whole of the soil, decayed with the impurities of two thousand years (p. 347).

This contains something of the truth, but it is certain that if the old wells were accidentally closed, they were afterwards opened, or others were sunk. Had Sir Walter Besant ever heard of the famous Aldgate Pump? Even to-day wanderers in London may note disused pumps; not very many years ago the handles, now removed, were chained up. Two such dismantled pumps may be seen in Lincoln's Inn, opposite to the Hall. It is, indeed, only since the cholera scare of 1854 that the use of "spring water" in London has been discontinued. In the Introduction to his "Handbook of London" (edition 1850), Peter Cunningham, after warning the visitor to London against the unwholesome water furnished to the tanks of houses from the Thames—the water, that is, supplied by the Water Companies—continues, "Good

drinking water may be obtained from springs and pumps in every quarter of the town by sending for it." This source of supply is not even yet wholly cut off; a pump in actual use is in Staple Inn, Holborn, and its water is in high repute. But, in comparison with other horrors, the water supply of London was not too bad—in some cases was fairly good, though even to-day London is very far below the standard of ancient Rome. The water of the New River was brought to London only in 1613, but from the middle of the thirteenth century water was brought to the City from Tyburn in leaden pipes.

As we have mentioned Tyburn, it may be observed that Sir Walter Besant, like other historians of London, writes with uncertainty as to the site of Tyburn gallows. There is, however, perfectly good evidence to show that, at least from the time of Elizabeth till the middle of the eighteenth century, it stood, a permanent structure, at the corner of Edgeware and Bayswater Roads. Towards the end of 1759 a movable gallows was erected when required, and this was set up in Edgeware Road, not always in the same spot. Tyburn ceased to be the place of execution in 1783.

Sir Walter Besant set himself to destroy the popular legend of the rise of the low-born apprentice to the Mayoralty. He shows by comparison of names that many great country families were allied to City merchants, and contends that "a younger son of a gentle family, from the fourteenth to the seventeenth century, at least, regarded trade in the City as a desirable and honorable profession" (p. 217). The limitation of date leaves untouched Hogarth's famous series of the two apprentices, a work which presents the tradition in a very definite form. But, granting all that is urged, we must still allow that some young men of talent, energy, and industry must, in these, as in all other times, have come to the front, in spite of all obstacles. The tradition does not represent the successful career as falling to the lot of every apprentice. A few instances amply explain and justify the tradition. A note is given of the origin of 119 Mayors, Aldermen, Sheriffs, and City Officers, from 1579 to 1664. Among these were 75 sons of country gentlemen and City merchants; 5 were sons of parents seemingly poor; the parentage of 39 is not ascertained. Here, surely, is sufficient room for the play of tradition. Curiously enough, though Sir Edward Osborne, Mayor in 1582, is named as the founder of a family afterwards ennobled (p. 224), no reference is made to the story of the origin of his fortune, his marriage to his master's daughter, whom he had saved, when an infant, from drowning. As Osborne is described as a young gentleman, the incident, real or imaginary, might be adduced on either side of the question.

The numerous and excellent illustrations are not the least attractive feature of the book. Many are taken from manuscripts in the British Museum and elsewhere. An incongruous effect is produced by the inclusion of reproductions of two modern pictures; this may be said without in any way detracting from the merit of these pictures as works of art.

A STUDY OF LINCOLN.

Lincoln, Master of Men: A Study in Character. By Alonzo Rothschild. Boston: Houghton, Mifflin & Co. \$3 nct.

It was once supposed that a man's life might be definitely written and the gate to further effort in that direction permanently closed. That theory, discouraging to the laudable industry of book production, is now evaded by the discovery that a man does not simply live, but lives in various relations, which are capable, like the cultures of the bacteriological laboratory, of isolation and separate consideration. The new method is evidently sound in its principle, and the question in any application is simply of the importance of the phases selected and the competence of the writer.

As Lincoln himself often humorously questioned his influence with his own Administration, inasmuch as there were always around him men convinced of the need of some one to manage it for him and their own ability to supply that need, and as men have differed ever since in their efforts to strike the balance between the contending forces, it can hardly be said that Mr. Rothschild has selected an unimportant phase of Lincoln's career. After devoting two chapters to his earlier life, Mr. Rothschild centres each of his six remaining chapters about Lincoln's relations with one of six prominent men with whom circumstances brought him into some degree of conflict, namely, Douglas, Seward, Chase, Stanton, Frémont, and McClellan.

The earlier chapters suffer, as we suppose all treatment of Lincoln's early life is inevitably destined to suffer, from an excess of essentially trivial anecdotes. The author, of course, endeavors to select and arrange his forkings from the anecdotal chaff-heap in such a way as to show an essentially masterful nature from the start, but with results hardly sufficient to compensate the effort. It is possible that such real mastery over men as may be proved for his later years developed, under the pressure of need, from germs till then latent. If not, the deductive inference from later events to its earlier presence is more convincing than apocryphal anecdotes, many of which came to light in the myth-engendering atmosphere that naturally enveloped his memory after the tragedy of his assassination. As to the Douglas episode, there was hardly anything left for Mr. Rothschild to do, for in that famous struggle the superiority of the plain, honest country lawyer, fundamentally in the right, to the smooth and shifty politician, patriotic in his impulses, but fundamentally in the wrong, is too clear to demand any further demonstration, even if we had not the striking evidence of Douglas himself passing over from the one trend of thought towards the other in the pathetic and highly honorable close of his career.

But when one passes into the group of chapters treating of Lincoln's official relations with Seward, Chase, and Stanton, the substantial value and strength of the author's study at this point is so evident as to reduce to comparative insignificance any unfavorable impression received at the start. His picture of these three great men, each superior to Lincoln at certain points, each inclined to overrate his own

official importance and belittle both the ability and the constitutional prerogatives of the President, all three possessing flaws of temper which made it hard for them to get along either with their chief, with one another, or with party leaders on the outside, and yet all three held to their posts by Lincoln's unfailing tact and patience, and used for the rescue of the country from its peril—this picture is admirably drawn. And it is drawn, too, without any disposition to minimize the ability of the three men whom Lincoln is convincingly shown to have controlled at all points which he himself regarded as essential. At the same time, Mr. Rothschild does not fail to point out that in some of the instances in which they were effectively overruled, Lincoln was in the wrong as to the merits of the case. Of the three, Chase alone proved incapable of correcting the gross underestimate of Lincoln with which they had entered the Cabinet; and to this persistent blindness was doubtless due the friction which finally broke the official bond between them, not because the President's patience was unequal to the strain, but because he was at last convinced that the good of the service demanded the secretary's retirement, just as it had previously demanded his retention, and continued to demand that of Seward and Stanton.

In the President's treatment of the two military thorns in his side, Frémont and McClellan (we do not imply that there were not others), the thesis of the author finds a less conclusive argument. Seward, Chase, and Stanton were unquestionably great men, held together in such a way as to render tremendous services to the country in spite of friction and misunderstanding which would have shattered the Cabinet of any ordinary President within three months after his inauguration. If Frémont was really a great man, his greatness failed of demonstration. Circumstances for a time gave him a popularity with the more advanced anti-slavery element to which he cannot in the light of subsequent history be shown to have been fairly entitled. After his failure in Missouri, he was offered a chance to redeem his military standing, but he was unequal to the task. He illustrates the President's magnanimity, hardly his mastery. As Mr. Rothschild admits, the controversies swarming around the figure of Gen. McClellan are incapable of argumentative settlement. It must surely be conceded, however, that the President signally failed to control him, or to secure from him conspicuous military service to the country's cause. There are many who believe that McClellan's shortcomings were due to the fact that the President tried to control him. The more general verdict is that McClellan's military genius, however great for preliminary organization and defence, was fatally lacking on the aggressive side. In either case, we do not see that he is an effective illustration of Lincoln's mastery of men. We do not wish to be understood as offering any criticism of the author's treatment of the military careers of these two men, for it is essentially accurate and able. The only point is, that it does not fall in logically with the author's purpose.

The list of books cited possesses a degree of inclusiveness which leads one to note

with some surprise the absence of any mention of the admirable tribute of Carl Schurz, issued from the same publishing house a few years ago. The present volume has been handsomely treated by the publishers in its material make-up, and is provided with excellent portraits of the men considered. For an index of sixty-six columns, we return hearty thanks.

Recollections of Thirteen Presidents. By John S. Wise. New York: Doubleday, Page & Co. \$2.50 net.

The list of Presidents whom Mr. Wise has met personally (though not in all cases during their term of service) extends from Tyler to Roosevelt, with but four omissions, namely, Polk, Taylor, Fillmore, and Lincoln. His view of Tyler is, of course, not based on recollection, as he was but a little child when he saw Mr. Tyler, some ten years after the close of his term. The chapter on Pierce is interesting chiefly for the publication of two letters from the author's father, Henry A. Wise; one to Pierce himself, detailing the inner history of his nomination, and the other to Pierce's law partner, Col. P. R. George, making a vigorous declaration of war in case certain Cabinet rumors should prove correct:

If a Douglas man goes into that Cabinet it won't last twelve months. As for me, I can paddle my own canoe. I ask no odds, and if not satisfied will give no quarter. I will not tolerate that Douglas faction. . . . I had rather dig sweet potatoes here at home than be considered an expectant. My name has been allowed to be battered about with that of — and — and such cattle until I feel it is sooty and greasy.

On the whole, the younger Wise is inclined to rate President Pierce somewhat above the general estimate. As to Buchanan, on the other hand, he rather reflects the contemptuous Southern opinion held by such men as his father. "Bah!" said the latter, when asked to persuade Buchanan to take a decided stand on some point, "you do not know Mr. Buchanan, or you would not expect him to take decided ground about anything." "The great crisis which he was called upon to confront," says the son, "found him a weak, vacillating, hysterical old man, with whom everybody, friend and foe alike, at last lost patience."

When Mr. Wise got back home from his four years' residence "outside the United States," it was to find the Presidential chair occupied by one of that "sorry lot" which took the Northern side in spite of Southern residence and antecedents. President Johnson, however, had long been a friend of Hugh Douglas, whose daughter Mr. Wise was destined later to marry, and, in spite of the aristocratic prejudice of Mrs. Douglas, coupled with her strict Presbyterian disapproval of the liquor habit, the ex-President was a guest at the wedding, where "nobody could have been more courteous or punctilious or have borne himself with more dignity or decorum." Mr. Wise acquired a considerable personal acquaintance with President Grant during his Administration. The chief incident of this acquaintance which he has chosen to record relates to his success in securing a pardon for a client whom he had unsuccessfully defended against the charge of violating

the revenue laws. The claim for pardon was based on the plea that a prejudiced judge had browbeaten the jury into conviction on a criminal charge when the same evidence, presented in another court in a suit to libel the man's distillery, had resulted in acquittal. The pardon was easily secured, but Mr. Wise adds: "My poor old client was no doubt guilty. He was of the class, quite prevalent in those days, that believed it was fair to cheat the Government. But a better-hearted creature never lived." The author shares the opinion of most thoughtful men that the Administration of Hayes will stand higher in the estimate of the future than it does at present. He admits a strong prejudice against Garfield because of his social intimacy with the Democratic leaders of the South, "a hypocritical, vindictive, double-faced set," insincerely taking advantage of Garfield's friendship to get their pet measures through Congress.

Curiously enough, the note of warm personal friendship sounds clearest in Mr. Wise's record of his relations with Mr. Cleveland. He is especially indignant toward the slanderers who have made so many vicious stabs in the dark at his private character, both during his Presidency and since his retirement, and quotes him as saying in private conversation, soon after the death of McKinley:

I don't know whether, after all, McKinley's life, sad as was its ending, was not, taking into consideration everything, to be envied. It is true he was struck down by an assassin. But he never was "assassinated" in his lifetime. . . . Somehow he seemed to possess the faculty of evoking charitable judgment and kind treatment. If I could have had that sort of thing as long and as uniformly as he did, I believe I would have been willing to pay the price he has paid.

One could wish that the author's criticisms of the McKinley Administration, in most respects thoroughly deserved, had been kept entirely free from the story of his own disappointment in his candidacy for an appointive office. As to the story itself, however, it is worth while to have at hand so admirable an illustration of the fallacy of Mr. Wise's theory that the political method of filling subordinate offices is better than the merit system. It is very easy to talk about leaving the appointing power free to pick out the fit man as an individual, but that freedom is generally just as seriously hampered in other cases as it was when Platt made it impossible for McKinley to give Mr. Wise the appointment which he desired. Mr. Wise shares the popular admiration for the present incumbent of the Presidency, but deplores an alleged tendency to admit to his councils "men who are not Republicans or even representatives of any political ideas." Unfortunately the parties are not named, but one scents the trail of the "mugwump."

We have said enough to indicate that the book is confessedly partisan rather than judicial in its tone. It is an interesting series of political sketches from a personal point of view, and the intelligent reader will have no trouble in recognizing the point of view and making all necessary allowances. We have noticed few slips of fact with the exception that Blaine's death is referred to as occurring shortly after the nominating convention of

1888, and that in another passage Cleveland's second election is similarly antedated four years. The book is nicely printed, and illustrated with portraits of the Presidents considered, together with a few other eminent personages who are brought into the story.

The New Far East. By Thomas F. Millard. New York: Charles Scribner's Sons. \$1.50 net.

This book purports to be an examination of the situation in the Far East resulting from the Russo-Japanese war, the chief points of the discussion centring about the relations of Japan, China, and the United States to the Far Eastern question. The thesis which the author is constantly suggesting is that Japan has always acted in a way that should deprive her of the sympathy of this country, and that we must view her as a hostile Power with which we shall have to deal in the near future. Even as early as the war of 1894 we can trace the distortion of view that is maintained so consistently. The intervention of France, Germany, and Russia at the close of the war, which the world, until Mr. Millard wrote his book, viewed as the beginning of the policy of grab that led to the events of recent years, is thus described. The Powers—

saw that China was incapable of defending herself, that Japan was ambitious to establish herself on the Continent, and that unless the peace terms were modified by intervention, the dismemberment of China had actually begun. . . . My own opinion, based on considerable familiarity with the questions involved, is that the action of the three Powers was in itself entirely proper and conducive to the good of the world.

What was it conducive to? The seizure of Manchuria by Russia, the seizure of Kiao-Chau by Germany, the expedition to Peking and the Russo-Japanese war. It may be that Japan herself was playing the game of grab, but to condemn her and extol the intervening Powers is hardly convincing. When we come to the seizure of Port Arthur and Wei-Hai-Wei, we get the following misrepresentation. Our author is anxious to produce the impression that Russia was drawn into taking Port Arthur by the circumstances of the time; hence he alters the order of events, making the Germans take Kiao-Chau, then the English Wei-Hai-Wei, and lastly the Russians Port Arthur. "These events came rapidly, and each was largely the cause or result of the others." It is a plain matter of fact that England took Wei-Hai-Wei as a military offset after Port Arthur had been occupied, and only for such term as the latter should be held by Russia.

How trustworthy and anxious to arrive at the truth Mr. Millard is may be judged from the following example. When speaking of the advance of the Japanese armies through Manchuria he says, with the usual insinuation: "For various reasons easily understood, thousands of Chinese, many of them persons of substance, abandoned their homes upon the advance of the Japanese armies." If the reader will pause one moment to consider plain facts, he will doubtless realize that every serious advance of the Japanese from Port Arthur to Mukden was made during continuous fighting, under which the civilian population of any and

every country could obviously not continue, so that a statement of this sort is entirely valueless. Mr. Millard reproduces the complaints of the Russian press as to the violation of neutrality involved by Gen. Nogi's occupation of Hsinmintin. This is a delicate question that would take long to discuss; let it suffice for the present purpose to say that, on our author's own showing, the Russians had previously crossed the neutral line; and, further, that we have it from Russian sources that, on the 25th, two days before Nogi reached that point, Kuropatkin ordered Gen. Bürger with a small division to occupy it; Bürger arrived too late.

In speaking of the preamble of the Anglo-Japanese treaty of alliance, Mr. Millard declares that the first clause "is merely the usual thing and quite meaningless." If by "usual thing" he means common diplomatic form, the statement is not correct; it may further be stated that this first clause has appeared so important to at least one French writer, M. Aubert, whose excellent *Paix Japonaise* we noticed a few weeks ago, that he makes it the text of his book. There is hardly one word of Mr. Millard's comment on the treaties that commands assent; one example more on this point must suffice. Referring to article iii. of the treaty of peace, which deals with the evacuation of Manchuria, we find the following: "Russia declares that she will not in the future claim in Manchuria any territorial advantages or preferential or exclusive concessions, but Japan makes no such declaration, which is significant in view of the fact that it was considered wise to put Russia on record." The drift of the argument and the suggestion are sufficiently obvious, yet the reader may be surprised to hear that the treaty contains nothing of the sort. Subsection three of article iii. deals merely with the situation of Russia before the war and at the time of the signature of peace, and is a disclaimer on her part of holding any concessions or special privileges in the territory that is to be retroceded to China. The clause runs: "The Imperial Government of Russia declare that they have not in Manchuria any territorial advantages or preferential or exclusive concessions to the impairment of Chinese sovereignty, or inconsistent with the principle of equal opportunity."

That we must not expect Japan to pursue an altruistic policy, that she will take all she can, that she may in places injure our commerce, and even that we may eventually come into hostile contact with her, is all true enough; but any such argument as that which Mr. Millard puts forward is unworthy of serious attention.

Constantinople: Painted by Warwick Goble. Described by Alexander Van Millingen, M.A., D.D. New York: The Macmillan Co.

There is a saying in Constantinople that he who once visits her will surely return. This, perhaps, is not true of the tourist or casual visitor; but it is true of all who have sojourned there long enough to feel the real charm of the place; and in the breasts of such fortunate or unfortunate beings, this book will rouse a tumult of yearnings. A large part of the attraction of Constantinople is doubtless due to the beauty of its situation, almost, if not quite

unsurpassed among the cities of the world. Then, too, nowhere is there such a fascinating combination of races and customs, for here Europe and Asia join, producing effects which cannot be paralleled. Moreover, to use Professor Van Millingen's words, "to live in Constantinople is to live in a very wide world" (p. 262). One has involuntarily the feeling that one is assisting in the management of the universe, or at least a large part of it. Now you "assist" in the arrest and deposition of a Grand Vizier, now you are mobbed along with the Minister of Finance, now you sit in council with the Minister of Public Instruction on the education of women, now you are dining in European fashion with men famous in art, letters, finance, or statesmanship, now you are drinking coffee and smoking a *narghileh* in a quaint café, ages ago, in the heart of the unchanged East. You live in many centuries, in many nations, in many religions, many customs and habits: all things are possible, anything may befall you.

We wish we might see Mr. Goble's original color sketches, or paintings, from which the more than sixty colored plates that illustrate this volume have been taken. (The plates, by the way, come out even better in lamplight than by daylight). Color is one of the charms of Constantinople. As Professor Van Millingen says, "the city is generally irradiated by an atmosphere of extraordinary clearness, brilliance, and warmth of color." Opposite a picture of the Golden Horn in the early morning is a description of a sunrise when Constantinople wears a flimsy *yashmak* of mist; "as the sun gains strength, it is beautiful to see the veil gradually rent at different points, and the objects it covered emerge, piece by piece, one by one, now here now there, a dome, a minaret, a palace, a red-tiled roof, a group of cypresses, as though a magician was constructing the city anew in your presence, until the immense capital gleams before you in its mighty proportions and minute details" (p. 104). Such care has been taken to connect the pictures and the text, that one scarcely knows whether the text was made to fit the pictures or the pictures to fit the text, but whichever it be, the harmony is remarkable.

He who visits Constantinople for the first time is apt to feel as though he had stepped into another world, quaint, old, and unchanging. To him who has spent his life in the city, on the other hand, everything seems to be swiftly changing. Since 1888, especially, when Constantinople was brought into direct connection with Europe by rail, the transformation has been very rapid, so that Professor Van Millingen speaks of "the annexation of Constantinople to the Western world. New ideas, new fashions now rule for better and for worse. And soon the defects and the charms of the old oriental city will be a dream of the past" (p. 206). A picture of a fortune-teller in Stamboul shows an old negress in bright blue telling the fortunes of two veiled Turkish women in brilliant *feredjecs*. On the opposite page (200) we read of the new costumes which are rapidly banishing from the streets just such scenes as the one Mr. Goble has here painted. The outer garments of the women have largely lost their color. The dresses of different nationalities are be-

coming assimilated, and all are tending toward the monotone effects in style and color of modern European clothing. This is one of the misfortunes of the advance of civilization.

Born and bred on the Bosphorus, Professor Van Millingen displays a pride of citizenship which at once differentiates his book from the writings of even such enthusiasts as De Amicis. That the author of "Byzantine Constantinople" and Murray's "Guide Book" is a competent cicerone in modern Constantinople, and an expert in its topography, art, and antiquities, goes without saying. We would not leave the impression, however, that this work is either a treatise on art and archaeology or a guide book. It is a gallery of paintings, representing Constantinople as it appears to the artist, through which you walk with one who tells you briefly and effectively the tale of its glorious past, with an incident about this gate, that tower, or yonder mosque which was once an ancient Christian church. You go from St. Irene to St. John Studius, to SS. Sergius and Bacchus, to Santa Sophia, to St. Saviour-in-the-Chora, and finally to such mosques, which were never churches, as the Suleimaniyeh. You follow the development of architecture from the basilica to the dome, and so on to the final realization of "the ideal of Byzantine architects." And as you study this graceful and inspiring type of architecture you wonder why it does not find its place along with the Gothic in the modern development of ecclesiastical architecture in our Western world.

Here Professor Van Millingen stops to read an inscription on a wall or in a cemetery and to tell you a little story of the past; and here in the side streets and cafés of Stamboul you are introduced to the natives of the land. You hear a word about the religion and the customs of today, always sympathetic and always illuminating. You catch a glimpse of cruel persecutions as you meet the porters, or *hamals*, carrying on their backs through the narrow streets their great loads—sometimes it may be an upright piano. Before 1896 the *hamals* were all Armenians; in the massacre of that year the Armenian *hamals* were exterminated, and the business of freight and baggage transportation thrown for a period into hopeless confusion. Now Kurds from the interior of Asia Minor have replaced the Armenians. But you hear also good things about the Turks and their religion, about the dignity and inspiration of the worship at the mosques, the democracy of Islam, which, provided men are Moslems, knows no distinction of race or creed, of high or low.

It is a captivating book, and fills him who knows Constantinople with a sinful desire to embrace her once more. "God will reward the Moslem, who, having beheld the beauties of a woman, shuts his eyes." One may perhaps apply the same proverb to Constantinople.

The City the Hope of Democracy. By Fredric C. Howe, Ph.D. New York: Charles Scribner's Sons. \$1.50 net.

This volume is the work of one of the intelligent and well educated men (there have been a number of them) whom Tom

L. Johnson has gathered about him in his attempts to put certain ideas in practice in the government of the city of Cleveland. Mayor Johnson's career has been somewhat picturesque to outsiders, because of certain personal characteristics; but his leading ideas are susceptible of clear statement and argument, which Mr. Howe has endeavored to supply in the volume before us. For good or for ill, Mr. Howe says, we have become a nation of city dwellers, and shall remain so. The allurements of the city are too great to be resisted, and the only thing to do is to accept the situation and make the city a fit place for the improvement of the race, not an engine for its destruction. The admitted corruption in city government as it now exists, he attributes not to the mere failure of the electorate to choose good men to office, but to the practice of granting franchises of enormous money value to private individuals and corporations, thus creating a powerful stimulus to greedy interests to control the government for unworthy ends. An outburst of reform may lead to the choice of incorruptible men for a time, but the temptation is still there, and soon the government is again as deep in the mire as before. Of course, this leads him at once to the theory of municipal ownership and management, which he would limit, however, to cases in which genuine competition in private hands is practically out of the question, such as the supply of water and light, and the street-car service.

In no case, however, would he force municipal ownership upon communities regardless of their own choice. The city, he holds, should be a self-governing unit in all matters which do not seriously concern outsiders, bearing somewhat the same relation to the State as the State does to the Union. This can be fairly demanded, for the problems of city life and administration, under modern conditions, are so peculiar, and so vital to the welfare of the city population, that only local management can be expected to deal with them intelligently and successfully. The State, then, should turn over to the city its own control, with only such restrictions as will safeguard the legitimate interests of the State itself and its other subdivisions. The city should have untrammelled power to select what ones, if any, of its public-service industries it should itself own and administer. It should have power, too, to select its own form of taxation to meet its own expenses. Personally, the author favors land values as the basis for the entire amount of taxation required, but he would not have this imposed upon any city against its will. In short, he would make of our cities a huge series of laboratories, working independently upon the as yet unsolved problems of city government. Cincinnati should have full power to demonstrate the possibility of uprooting Cox and all his works with no further change than the election of honest men to office, while Cleveland might be trying the full length of the programme recommended by Tom Johnson. Thus, by a free use of the experimental and comparative method, we might hope in time to arrive at sound general principles if there are such, or, if not, to adjust ourselves as comfortably as possible to varying local conditions.

It must be said that Mr. Howe does not unanswerably support his belief that the removal of the franchise bait would result

in the practically complete banishment of the sharks of political corruption to other waters. The history of our city governments does not justify the assertion that corruption in matters not connected with public-service franchises is merely sporadic and unimportant. Neither does it justify the belief that the people can be depended upon at once to rise at the polls and rebuke inferior service if that service is rendered by public and not private hands. Our inertia in such matters is proverbial, even in fields where we already have full scope to work reform if so disposed. Nor does the statement that the total number of employees under the municipal-ownership system would in no case exceed 10 per cent. of the voting population free the system of the charge that it would involve danger of the organization of a troublesome political machine out of these employees. One-tenth is no slight weight in the balance when compared with average majorities in city elections. Human nature is not to be seriously altered by a change in the system of street-car management. At the same time, if the people are bent upon experimenting with municipal ownership, we are bound to say that there is no safer method than that outlined by Mr. Howe, that the State Legislatures should give to cities such a real control over their own affairs as would allow of the experiment wherever a majority might be convinced of its wisdom. That American cities should remain permanently the sport and prey of Legislatures either ignorant of their needs or too corrupt to attend to them honestly, is of course unthinkable. There must be a chance to jump out of the frying-pan. Many will believe that Mr. Howe's advice is practically to jump into the fire, but he would deprive no city of any alternative which it might prefer, even that of continuing to fry.

The Principles of the Administrative Law of the United States. By Frank J. Goodnow. New York: G. P. Putnam's Sons. \$3 net.

The reader of this book finds himself confronted at the outset by a question which will perhaps give him more trouble while reading it than it appears to have caused the author—namely, What is that Administrative Law of which the principles are to be here expounded? Whatever it is, Professor Goodnow teaches it at Columbia, and he is the author of a learned work on Comparative Administrative Law written some years ago, in which the Administrative Law of different countries is compared—a better book, to our mind, than the present one. What he then had to say about the principles of American Administrative Law is the foundation of the present treatise.

The new treatise undoubtedly discusses questions connected with administration, and these questions are legal. The exposition is fortified by cases, and if the result is to be considered as simple description, we should call it a sort of sketch of the working of the administrative part of our politico-legal machinery. We have, for instance, a great deal about the "distribution" of the legislative, judicial and executive powers (the American legal development of Montesquieu's theory); we have a distinction of the author's own be-

tween "politics"—i. e., the policy of the state as determined—and administration; we hear of military affairs, financial affairs, internal affairs, foreign relations, officers and offices, civil-service rules, and even such matters as habeas corpus and quo warranto, but we forever labor under the difficulty that we do not make out the boundaries of American Administrative Law.

Now this is a very serious defect in any attempt at exposition. It is not to be found in any work of authority on Common Law, or Statute Law, or Equity, or Constitutional Law, or Canon Law, or Admiralty. The confines of these are all clearly marked out. Why is it that, in Mr. Goodnow's pages, there is this constant sense of failure in making out exactly what American Administrative Law is? The author himself comes near supplying us with the answer when he recalls the fact that Mr. Dicey, in his valuable work on the "Law of the Constitution," insists that in England, from which country our general principles of law are derived, there is no such thing as Administrative Law at all—that it is a branch of law peculiar to France or other countries deriving their law from Rome (*Droit Administratif; Verwaltungsrecht*), and is hostile to the principles of English Law. Mr. Goodnow, contends, in reply to Mr. Dicey, that the latter is misled by the simple fact that the *Droit Administratif* of France recognizes as one of its fundamental principles two different kinds of responsibility—one the ordinary responsibility of every subject to the law, the other the responsibility when a subject (or citizen) is involved in a question to which the State or a member of its administrative force is a party. In France questions of the latter sort are decided according to a severer set of rules than ordinary law furnishes, and there are separate administrative courts which decide them, and, further, a superior tribunal which passes on the very serious question what cases are administrative, and what are cognizable by the ordinary civil tribunals. But there is nothing of this sort in England, or, for that matter, in America. There is no distinction in general between the legal responsibilities of officials and ordinary citizens, no recognition of two kinds of law.

While admitting this, Mr. Goodnow appears to believe that Mr. Dicey has overlooked the fact that there are a great many other matters involved in Administrative Law besides this one, and that they find a home here as well as in France. But he does not seem to perceive that Mr. Dicey's contention is fatal to the discrimination of such Administrative Law as we have from Constitutional Law and law in general, and we are, therefore (conceding Mr. Dicey's point), left in the position of being forced to refuse to define what the limit of our Administrative Law is. The President cannot be sued for damages for an act done in the course of his official duty, but he does not have to go into a special court to enforce his exemption; the ordinary courts will enforce it for him, exactly as the ordinary courts will enforce the liability of a sheriff or a collector or an assessor in damages. The post-office is, we believe, exempt from damages—unless by statute; but this exemption is enforced everywhere. The Court of Claims, of the jurisdiction of which the

author gives an account, has a special cognizance of suits of a certain class brought against the United States; but the principles of law administered in it are not different from those general principles of Law and Equity which are invoked as between subjects or citizens in any court of justice. Again, there is a great body of administrative rules constantly made by and enforced through the Departments and the civil-service authorities, with the President at their head; but these rules, if reviewable at all, are reviewable by the ordinary courts, in the ordinary way, and constitute no law apart. When the courts say, "This is a political question, this is an executive matter, with which we, as judges, have nothing to do," they are applying a principle of Constitutional, not Administrative, law. The author attempts a distinction between Constitutional and Administrative Law in our system by saying that the former deals with its anatomy, the latter with its functions; but this does not advance matters. It is a figure of speech, not effective analysis.

On the whole, we go back to what we said at the beginning: There is a wide difference between the law affecting our administration and the *Droit Administratif* of other countries, and the difference makes a comparison between the two instructive; but leave out the other term of the comparison, and we do not find within the confines of our *corpus juris* any distinctive body of Administrative Law governed by principles and developed by courts of its own. This difficulty Mr. Goodnow has to contend with throughout his present volume, and for the vagueness and haziness of his analysis it in great measure accounts. In a certain sense he has made the subject his own; but he has not made it ours.

Porcelain, Oriental, Continental, and British: A Book of Handy Reference for Collectors. By R. L. Hobson, B.A., Assistant in the British Museum, etc. New York: E. P. Dutton & Co. \$3.50 net.

This book disappoints the buyer in a way that he knows well. There is a loss of practical usefulness in the failure to study wares of recent design and manufacture. The historic specimens of any ware, upon which the student is told to build up his knowledge, are inaccessible to him; they are in private collections or in the almost equally forbidding glass case of the museum, which is for most busy people a solid wall, through whose glittering and often dusty semi-transparency only a dim image can be got. For where is the museum whose porcelains are put close to the glass and in convenient corners of cases, so that the light may fall strongly upon them, and so that more sides than one can be looked at close at hand? The chance of study at the repeatedly succeeding exhibitions and at the shops of dealers where authentic wares are on exhibition, should be utilized more than it is. Even in an historical sense modern wares may be instructive, because one can learn from them what is the true character and the exact appearance of painting under the glaze of enamel paint, of grain-of-rice porcelain, and the rest. The processes are so nearly the same in different

lines and in different ages that one can learn a good deal about porcelain in the best shops of the great cities; nor is it much to be feared that the student will be led astray by the misrepresentations of salesmen.

The difficulty of bringing such a study as this down to the author's own time is not to be denied, nor is it to be forgotten for a moment; but then the need is equally great. Mr. Hobson, busy in the British Museum, and occupied even with the very duty which these remarks call attention to, that of cataloguing and comparing ascriptions and descriptions, can hardly have found time to study the greater and the smaller exhibitions which the last twenty years have seen; and yet the need of an immediate knowledge of what has been done within twenty years in Japan and in China, at Sèvres, at Copenhagen, and by the English makers, becomes the more obvious as we look more closely into his book. Thus, the interesting Copenhagen porcelain, which is as popular as a ware with a refined style of decoration can be, and which is to be found in the better shops (which also has been exhibited very thoroughly of late years at great national and international shows), receives only the following notice from Mr. Hobson: "An improvement took place under Hetsch's direction in 1824, and the factory is still flourishing," which is followed by a description of the marks of the factory. It must be understood, of course, that most of this shortcoming is the inevitable result of dealing in so small a book with so vast a subject.

The reader will notice that what we have said has been in the way of protest against omissions—against declaring a book to be a treatise on porcelain and a book of ready reference for collectors, while the collector is left without a suggestion of where knowledge is to be gained. It is to be said now, and in terms of hearty praise, that what is given in the book is generally admirable. The examination of Oriental porcelain, both historical and in the way of critical comment, is as good as a brief treatise with only half-tone illustrations is ever likely to be. The treatment is brief and precise in order that space may be saved, and although one might wish that those terms introduced by Albert Jacquemart, the unlucky *famille verte* and *famille rose*, had not been revived for this book, replacing descriptions by a mischievous because inaccurate name, yet we are told what is meant by those terms, and they probably do save a little space. The different wares and the different decorative effects explored by every busy student of Chinese porcelain are dealt with in a proper tone of enthusiasm mingled with careful inquiry. The extension of some methods of decoration to Persia and of many of them to Japan is treated in a judicious way. A considerable number of the emblems so frequent in the decoration of Chinese porcelain are given in simple cuts and sufficiently explained, and there is a brief sentence which is much needed in this connection, to the effect that "purely Chinese ornament is rarely without some inner meaning"; the character of which is here suggested. One likes the shrewd remark, p. 109, about the possibility that

the Koreans "have gained a spurious reputation for porcelain-making"; and the sham title "Indian porcelain," coming from the talk of dealers in old days before inquiry was critical, is denounced as it should be (p. 110). The account of Japanese porcelain suffers, as do other descriptive passages, from an apparent despair on the part of the author to explain in words the differences between one artistic effect and another. The remarks about the position of porcelain in Japan as relatively less important than in China are very intelligent; and will seem so even to one who cares greatly for that Japanese hard pottery of simple aspect which prevents porcelain from taking its place at the head of the Japanese ceramic world.

The account of the gradual steps taken in Europe to imitate the Oriental ware is good and clear, though of course not very new. The porcelain of Great Britain occupies an undue proportion of the whole work, fifty pages out of two hundred and thirty; but that is natural under the circumstances. From page 216 the reader learns something new about Lowestoft porcelain, based upon a discovery—a real piece of excavator's archaeology. And here is an odd remark (p. 217): "Possibly a few stray pieces of Chinese porcelain were decorated at Lowestoft"; this by way of disproving "the ridiculous theory that hard-paste porcelain resembling the Chinese ware was ever made" at Lowestoft. We are left without explanation of the troublesome problem, often coming up, the presentation to private and public collections of unquestioned Oriental porcelain decorated in European taste and called "Lowestoft." That mysterious attribution is, we are told, in the way of being exploded, or explained, because "the genuine Lowestoft ware is receiving so much attention" at present.

A brief final chapter deals with prices, of fine originals and of more or less gross falsifications, and a few words are said about the collections which are accessible to a student. There is a sufficient index, and the plates, forty-nine in number, and representing perhaps three times as many specimens, are as good as could be expected of the half-tone process on so small a scale.

The Life and Speeches of Thomas Williams, Orator, Statesman, and Jurist, 1806-1872. By Burton Alva Konkle, author of the "Life and Times of Thomas Smith." 2 vols. Philadelphia: Campion & Co. \$6 net.

It was with a certain feeling of surprise that the present reviewer received, some two years ago, a large octavo volume devoted to the "Life and Times of Thomas Smith." This feeling was renewed, and notably accentuated, on receiving the above *two* large octavo volumes, by the same author, on the "Life and Speeches of Thomas Williams." If the "generous recognition" for which Mr. Konkle thanks the critics of his first venture is in any way responsible for the additional volume of the work now before us, the present reviewer at least is almost tempted to regret whatever share he may have had in that recognition. That there is a place for the biographies of second-rate men scarcely enables one to contemplate with equanimity

the prospect of a series of such works, of which the fatness increases either by geometrical progression or inversely as the importance of the subject.

Thomas Williams was a man to whom the adjective "second-rate" would most assuredly apply. Known principally as a fluent speaker, with a taste for ornate phraseology, and as a good lawyer, he was, although widely read, in no sense a profound or even a careful thinker. Nor could the term statesman be applied to one who was at best only a safe councillor. Once only did he attain prominence in national affairs, and then he steered a course marked out by others, which, to say the least, was anything but statesmanlike; as one of the managers of the impeachment of Andrew Johnson, he out-Stevens Stevens—"could not with patience," says a contemporary member of his own party, "hear anything said against the wisdom . . . of impeachment." The perusal of Mr. Konkle's volumes leaves one with this judgment unreversed; on the contrary, confirms it absolutely.

One of two things might possibly have justified an elaborate study of the life and speeches of such a man as Thomas Williams—his being typical of some striking and coherent phase of local or national history, or the possibility of using the events of his life as convenient centres from which to present a careful study of the period in which he lived. Mr. Konkle's "Thomas Smith" is more acceptable than the present work, partly because it is much better executed, but partly also because Thomas Smith represented that conservative attitude which bulked so large in the Revolutionary movement and after. Apparently it has been Mr. Konkle's intention to present Thomas Williams as typical of the "aggressive Whig and Republican" phases of his period. The difficulty is, that the period from 1833 to 1870 is anything but coherent; Radicalism means so many different things in its different stages. Webster and Clay were typical Whigs in 1846; Lincoln and Seward were typical Republicans in 1856; Stevens and Boutwell were typical Republicans in 1866. But Webster and Lincoln, to say nothing of Webster and Stevens, were further asunder than Webster and Calhoun. In fact, no one man can represent this period in its diversity, and Mr. Williams represents nothing characteristically until the Reconstruction era, and to this only a small part of the space is devoted.

The result is a book that is neither very interesting nor very useful. The first volume is almost exclusively devoted to local politics, with which Mr. Konkle is familiar, certainly, but which are of very secondary importance. Until his hero gets into Congress in the second volume—which consists almost entirely of speeches—the author is hard put to it to bring him into any important relation with the great movements of the time. The effort to do so is made, however. An instance, exemplifying both the effort and the failure, is to be found at the close of the first volume. That Williams was "a founder of the Republican party" is heralded in the title-page, and the phrase reappears as the principal caption of a chapter of one hundred pages. Here one looks confidently for a careful study of Republican origins and of Wil-

liams's part in them. The result is disappointing. It transpires that, after all, Williams's share as a "founder" consisted in his being a member of the national committee and the author of the call for the convention of 1856.

Americana: Reiseeindrücke, Betrachtungen und geschichtliche Gesamtansicht. By Karl Lamprecht. New York: Lemcke & Buechner.

Americans who like to see themselves as others see them, and especially those who had the pleasure of meeting the distinguished professor of history, Karl Lamprecht of Leipzig, on his tour of the United States and Canada in 1904, will read with considerable interest his latest volume. It is in three parts—extracts from his diary, recording his own impressions, a chapter devoted to hearsay and less independent investigation, and a scholarly review of the historical, literary, artistic and sociological development of our people. The diary is most vivid and will be to many the most interesting; others will find it the least satisfactory, perhaps because of the truth it lays bare, perhaps on account of the peculiar vision of the writer. That the critic is scientific one would know if he had never heard his name; he is the proverbial German *Gelehrter*, and he carries his microscope about with him. The trouble is, however, in its adjustment: he gets it nicely trained on the animalcule, but often can't recover the drop of water in which the pesky insect swam! Like many foreigners, for example, he misses the element of romance on the Hudson, and thinks it cannot compare with the Rhine; he doubts if the great prairies will ever become to their dwellers a real *Heimat*, for their charm, the monotony of loneliness, must give way to progress; he beholds in the Rocky Mountains an area with neither history nor saga, "crying after a great poet as the air playing about them cries after a great painter"; and he looks on the American's destruction of the forests as "most atrocious" (*himmelschreiend*). "In matters pertaining to landscape," he says, "the taste of the average American has not yet been directed to that which is really beautiful, but only to that which is characteristic in the lowest sense: 'big trees,' geysers in the Yellowstone Park and the like; along with this, much liking for beasts and plants, so far as they are useful or good for the hunt: seldom, however, love without selfish interest." This misuse of Nature Professor Lamprecht observes in the laying out, constructing and operating of railroads, where there is a needless waste of wood, and also in the building of houses: in spite of the American's dread of fire, he persists in building in wood when he might use other materials, and deludes himself that his hotels and dwellings are "fireproof." What is odd, also, this widespread use of wood has not evolved a new style of architecture adapted to wood-building.

Here and there Professor Lamprecht comes upon pleasing reminders of the German contribution to America's growth—in Pennsylvania, German villages; in Wisconsin, "Deutsches Farmland, Land deutschen Fleisches"; but, for the mass of his fellow-countrymen here, he has but few

words of praise and many strong expressions of condemnation. The Germans in America have not kept together as they should; they have been won over, absorbed by the younger generation, and have become at last, in current literature and on the stage, the laughing-stock of those once their inferiors. "Whoever has visited the beer-gardens of Milwaukee," says Professor Lamprecht, "and especially the wretched Pabst Park, the model of a childish and stupid resort, a so-called modern pleasure temple, must say to himself that a people that patronizes such places and prizes them in their unsophisticated way, is not fit to compete intellectually with others." One notable exception he found among the *Einwanderer* from the Fatherland, and that is Carl Schurz, whom he saw in New York and of whom he says: "The first meeting was remarkable enough. I was asked in a company: 'What should be the chief characteristic of a biographer?' and as I answered, 'Love for his hero,' someone stepped forward and presented the question: 'What should be the attitude, then, of an autobiographer?' It was Carl Schurz, who was just then writing the story of his own life. Oh, could I but see you again reproduced, ye fruitful evenings that I spent with the Nestor of the German-American world! Verily, Schurz is justified in writing his biography, and his Life would belong, for the historian who lives for the art of his profession, to the fairest themes which the history of the nineteenth century offers." Professor Lamprecht concludes with a comprehensive survey of the intellectual development of America and a discussion of its probable future, in which he proves himself a careful student of our history.

The Cities of Spain. By Edward Hutton. With 24 illustrations in color by A. Wallace Rimington, and 20 other illustrations. New York: The Macmillan Co. \$2.

It is a sentimental journey to sixteen Spanish cities, from Burgos to Barcelona, with a dash to Tangier, of which Mr. Hutton here gives us the record. The sentiment is varied: now for landscape; now for architecture; soon for painting; then for history, for religion, for war, for romance. But from allegorized introduction to mystical conclusion, the indirect, the sentimentalized treatment is the author's preference. So much of his narrative is plainly imaginary, and the commonest things are so distorted in his unreal fashions of speech, that it is often hard to know what he would have us take for fancy and what for fact. Possibly he was moved to elect this strange style in the hope of being original where masters had preceded him—Gautier and Amicis and Ford; but we can but think that he is ill-advised, and that either an unmixed rhapsody or a straightforward tale of travel would have been better than his unhappy blending of the two.

When Mr. Hutton drops out of poetry, he usually has a clear-seeing eye. He speaks, it is true, of Burgos "upon her hillside," though nine-tenths of the city, and all of its significant part, is level with the river. The heights with their fortress rise behind; and the general impression is as far as possible from that of a city set on a hill. But most of the concrete char-

acterizations strike one as just. To say that Madrid "apes afar off the logical beauty of Paris," is to hit near the white; and one agrees with Mr. Hutton that the one "splendid gift" of the Spanish capital is the view from the palace across the deep valley of the Manzanares towards the Guadarrama mountains. That other splendid gift, the Prado gallery, he appreciates in several chapters, though his judgment of the paintings does not always seem sure. He is at least original in speaking slightingly of the Sala Velasquez!

But one would look in vain in this volume for either a full account of personal experiences or a close record of observations. Apart from the dutiful copying from the authorities of biographical and historical details, the touch is whimsical throughout; and one rather tires of the forced note and the strained enthusiasm. But compensation is made in the ample store of illustrations. Most of these are excellent, and some of striking merit. Those who have travelled in Spain will be glad to possess such vivid and satisfying reminders as Mr. Rimington's rendering of the Puerta S. Maria at Búrgos, the Alcázar of Segovia, or the mountains of Monserrat from Manresa.

Mountain Wild Flowers of America. By Julia W. Henshaw. Boston: Ginn & Co. \$2 net.

Although bearing an Eastern imprint, this charming volume comes to us from the far Northwest. It is an honest attempt to bring within the reach of lovers of flowers short descriptions of the fascinating vegetation of our American Switzerland. The Canadian Rockies and the other mountains within touch of our railroads are covered, where the snow permits, with a flora of exquisite beauty. Probably many of our readers remember the delightful papers of Helen Hunt Jackson, in which the flowers of Colorado were marshalled in stately procession; and our other mountain districts have received more or less attention at the hands of tourists and of residents, all of whom look upon the flowers as good friends. It must have required some courage to undertake this guide to a knowledge of the mountain flora. Where could the author draw the line? How could she construct a guide-book which would not be repellant to the average tourist fond of bright flowers? She solved the difficulty in regard to the latter point by classifying the flowers, after Mrs. Dana's fashion, according to their color. But she saw that the lines must not be drawn too strictly, and therefore she has given her sections a wider range: "white to

green," "pink to red," "blue to purple," "yellow to orange." This is rather better than having narrower limits of single colors. The discriminations appear for the most part to be accurate, and the matching of specimens ought to be pretty easy.

Eastern students will note the absence of some of the familiar flowers of our White Mountains. It is a far cry from Vancouver to the White Hills, and our plants could hardly lay claim to a place in the present volume, although it is called "Mountain Wild Flowers of America." Perhaps it is well for us to confess with some humiliation, that of the Alpine species growing on our White Mountains we have the right to call only one, or at most two, truly American. The others have come to us from the source which also supplied the same species to the high lands of the Old World, and we have held them only by grace of the Glacial Period. The plants described by Mrs. Henshaw are more truly American, and we are pleased that she has given us so many of them. She was fortunate in securing in her studies aid from Professor Macoun and other eminent Canadian botanists; and the book, thus carefully prepared, is certain to stimulate as well as delight all tourists to the wonderland of our great common Northwest.

Special attention must be called to the extraordinary excellence of some of the photographic illustrations. It is well known that the camera occasionally reveals more than the unaided eye can possibly see. For instance, a manuscript may under the searchlight of the camera confess that it is a palimpsest: the faint lines of the former writing which had practically vanished come back to be read. In some of these engravings, notably those of a few of the blue and purple flowers, the composite ancestral character of the species has been suggestively disentangled. The resources of modern methods of photographic reproduction for printing have been seldom put to much better use than in this volume. Perhaps, however, a subsequent edition may ambitiously and successfully try to utilize one of the three-color processes, and give us also the tints and hues which mountain flowers borrow from their sky.

The Principles of English Verse

By CHARLTON M. LEWIS, Professor in Yale. \$1.25 net, by mail \$1 33

A discussion of the chief types of English verse and the general principles underlying verse structure. The book avoids the usual text book style and will be found stimulating and useful. It contains, along with much that has been said before, some new ideas both on theory and on method.

The Week.

"Campaigning *in forma pauperis*" certainly describes this year's activity of the two Congressional Committees. Chairman Sherman announces with some pride that his one dollar subscriptions have reached "four figures." That is, they must total something like half as much as the single check which the Equitable gave Mr. Babcock two years ago. "We are poor," now rises the voice of Chairman Griggs, "and we cannot afford to chase rainbows." Therefore, if any district is hopeless, it is the duty of good Democrats to tell him so frankly. More modest in its requirements than even the Republicans, his Committee asks the faithful for the present to expend only the price of a two-cent stamp. We offer our sincere sympathy to the manufacturers of banners and torches and regalia. Their occupation's gone, indeed. But the fear that really haunts us in this crisis is that the Populists or the Prohibitionists who are not manifesting any scruples against taking all they can get, and presumably have as big funds as ever, may come forward suddenly, out-bid the poverty-stricken Democrats and Republicans, and run off with the election.

Gov. Higgins's statement of his reasons for refusing to remove Fiscal Supervisor Bender for violating the civil-service laws is queer reading. The tail of it eats up the head. It would almost seem that the Governor asked his legal advisers for two opinions about Bender: one completely exculpating him; the other condemning him roundly; and that then Mr. Higgins used parts of both. His decision begins by declaring that there was really no evidence against Bender, and that it is doubtful, anyhow, if the Legislature had power to pass so stringent an act against gifts to the party campaign fund by State officials; and winds up by showing how "detrimental to the service" is such "a disregard of the spirit of the civil-service law" as "this investigation has disclosed in this office"—that is, in Bender's. But the Governor declines to remove him, though the investigation was by a Republican Board of Civil Service Commissioners, who strongly urged Mr. Higgins to serve notice upon the politicians that this kind of defiance of law must cease. The notice which he has served upon them, however, is that if they make themselves a useful part of the Governor's machine, they have nothing to fear. It seems probable now that

Bender has all along had a promise of immunity from Mr. Higgins. The latter's action completes the display of a character which is the less admired the more it is understood.

A possible explanation of the almost complete failure of the New Hampshire press even to mention Winston Churchill's candidacy for the Governorship is his declaration, in a speech at Conway the other night, that seventy out of seventy-five newspapers in the State are subsidized by the Boston and Maine Railroad. To an audience made up in almost equal parts of "rusticators" and natives, he discoursed on the iniquities of the railroad lobby. He confessed that when he first entered the Legislature, he had confused the lobby and the Republican party of New Hampshire, and that even after enlightenment he had an idea that reform might be effected from the inside without unnecessary publicity. Then, in words that might have fallen from the lips of his own prototype in "Coniston," he declared: "You cannot expect a railroad which is reaping a large annual profit and gaining many inestimable advantages by governing a State to cease governing that State merely because a band of misguided idealists were foolish enough to sign the Declaration of Independence away back in 1776." The presiding officer at the Conway gathering thought it necessary to put an end to one misconception which he feared might be prevalent. A man he had talked with, he said, refused to support Churchill, on the ground that he was "a foreigner, and only a short time ago had been prominent in the British Parliament."

Resumption of dividends on the common stock of the Steel Corporation is a matter of wide interest. That company's dividend policy has from the start been subject to keen discussion. The promoters fixed for the common stock a quarterly dividend of 1 per cent., and announced it from the first as "regular." This they did in spite of the protest of practically all unbiassed critics and accountants that the company needed a larger working balance and very much larger allowance for depreciation, before attempting to pay out anything on this inflated stock. Some of the company's own officers endeavored to word the dividend announcement so as not to commit the company to continuous payment; but they were overruled; the controlling powers announced a "regular quarterly dividend." Hardly two years passed before a moderate trade reaction so far cut into earnings that these com-

mon stock dividends had to be hurriedly dropped. The accumulated surplus, which had reached \$99,809,000 in September, 1903, fell to \$61,794,000 in the ensuing March. But the lesson was not lost. The managers have paid no common stock dividends since that month. They have made much more liberal appropriations for depreciation. But continuance of large profits has now moved the management to resume the common stock dividends, though at only one-half the rate fixed in June, 1901. Under the circumstances, there is an excuse for the action which did not exist five years ago. We think that the management might better have merely announced "a dividend" than have declared "one-half of 1 per cent. for the March quarter and the same for the June quarter"; first, because retroactive measures of this sort are needless and confusing, and, second, because it looks like evasion of the fact that, in reality, the June quarter's entire surplus earnings are used to pay this dividend. Inasmuch as the total surplus, reported by the company itself for December 31, 1905, was less by \$15,000,000 than in September, 1903, there will be some people to argue that the common stock dividend ought to have been at least deferred until the surplus was brought to its former maximum.

Mr. Root's address at the Pan-American conference is a timely and most welcome footnote to the 'Monroe Doctrine. The history of American diplomacy, to be sure, abounds in altruistic expressions for the republics to the south of us, but, in view of what followed the war with Spain, and, more especially, of the seizure of the "canal strip," an explicit statement of our attitude towards these sister nations is by no means superfluous. Mr. Root's assurances on this point are admirable, both in substance and in manner. "We wish for no victories except those of peace," he said. "We wish for no territory except our own, and no sovereignty except over ourselves." These words must have been eminently satisfactory to all delegations save the Colombian, and, indeed, waiving by-gones, it is difficult to see how Mr. Root could have acquitted himself of a somewhat difficult task with greater tact and frankness. The note of condescension, which is most trying to races representing an older civilization than our own, was entirely absent. It is the hope that Mr. Root will labor actively to bring about closer and better relations with the other American republics which gives his words significance. He is a man who pays with his person, and it may be

assumed that his service to the cause of conciliation is not comprised in a single speech. In a large measure, he holds the situation in his own hands, and already has done much to allay distrust of the United States. Unhappily, the most durable sort of alliances—favorable trade treaties—are prevented by the policy of the party in power. Here, too, Mr. Root must have the courage of his idealism, and accept the ungrateful task of educating Congress to rational ideas of foreign trade. His elevated words will find a favorable echo from Patagonia to the Rio Grande; but they will fail of practical effect here unless some intelligent attempt is made to put the United States, not on such a commercial basis as England enjoys in South America—that is too much to hope—but at least on so tolerable a footing as a protective nation like Germany has made for herself.

On Monday at Charlotte, North Carolina, three negroes, whose trial for murder was already under way, were taken from the jail and lynched, in spite of the appeals of the Mayor, the Judge who was trying the cases, the city solicitor, and United States Senator Overman. The local militiamen, ordered out promptly, but thoughtfully supplied with only blank cartridges, were spectators at this outrage. The State of North Carolina seems to be rapidly earning for itself the unenviable distinction of being a centre for the most violent anti-negro feeling of the South. The recent action of its Republican State Convention advocating the further extension of the "grandfather clause" suffrage discrimination goes beyond any previous declaration of the kind in the South. As we have pointed out before this, the permanent retention of this method of letting the illiterate white man vote while excluding the illiterate negro destroys the only plausible excuse ever offered for the Southern Constitutions, namely, that after the expiration of the "temporary plans" they would impose the same tests for the suffrage on both races. As to this, some letters recently written by North Carolina Democrats are, to say the least, illuminating. Such is a letter in the *Atlanta Constitution* over the signature of J. R. Keen:

The negroes are wide awake to the situation, and are doing all in their power to educate themselves and their children, while the whites continue that indifference to education that has always characterized them. I last month listed the taxes of this township and nearly one-third of the men that listed could not make their "X."

Anthony Comstock and his Society have done such a world of good in suppressing the vilest sort of pictures and printed matter that it is a pity he should, from time to time, discredit his

work by unintelligent activity beyond his province. This time he has seized an issue of the *American Student of Art*, a monthly magazine issued in the interest of the Art Students' League of this city. The offence was merely the reproduction of a number of "academies," or drawings from the nude figure. This is commonly done by other art schools that maintain a journal. The circulation of such periodicals is practically limited to art students and those concerned with their instruction. In an individual case, a wrong use might conceivably be made of these nudities, but to pounce upon such publications is, as a teacher at our League justly remarked, as absurd as to hale the publishers of Gray's "Anatomy" to court for intentional pornography. All this is Greek to Mr. Comstock, but it is not Greek to some of the directors of the Society for the Suppression of Vice, who owe it to themselves and their work to restrain his more questionable vagaries.

There is a good custom in Boston by which no wealthy citizen may die in peace unless Harvard College and the Art Museum are mentioned in his will. The number of small bequests is considerable, and, being usually unrestricted, these minor gifts are a peculiarly available resource. If it is too much to hope that Columbia University and the Metropolitan Museum will ever make quite the claim upon New York that the corresponding Boston institutions do upon their more homogeneous public, one must at least desire that our greatest museum and university should be more generally remembered. We are glad to note that by two wills probated last week the Metropolitan Museum receives bequests of \$20,000 and \$1,000. The example is worthy of imitation. If, for example, every subscriber to the Museum should, according to his ability, "remember it in his will," the actual increase in income would be considerable, while small or even nominal bequests do as much as the more conspicuous donations to set a praiseworthy fashion. It should be quite as bad form to leave a will without mention of some beneficent institution as it once was to transfer an estate unprovided with some modest "back-log" of Government bonds.

One more rich young man has been exposed at his questionable diversion of pretending to be poor and needy. This time it is the son of a Chicago banker who wants to be a missionary. In preparation for that calling, he desires to become "on intimate terms with hardship and adversity," and has taken the position of scullion at the country club of a summer resort in southern Wisconsin. He has been scrubbing and scouring and polishing the handles of the big

front door there for the last month, and has enjoyed some singular experiences, as, for instance, being barred from the dining room when his family were eating at the club, and he had donned his own good clothes to partake of their hospitality. But the newspapers have discovered him. The self-abnegation of the rich man's son is under the same everlasting glare as his vices. In either case it must be an exceptional character that can develop normally under it. Given the most sincere ambition for simple and humble service, what can become of all these good intentions when the right hand can read in the papers every morning just what the left hand doeth? The poor, hunted scullion will have to drop out of sight and seek new employment, only to be exposed again and again and driven into more remote places. The hunted criminal is not more in terror of detection than the wealthy day laborer. And this, after all, is only the most insignificant side of a condition for which the sensational press is chiefly responsible. When the twelve-year-old grandson of a wealthy Chicagoan was gravely interviewed here the other day, on the questions of the hour, the pursuit of the families of the rich was seen in its silliest aspect.

The Liberal Administration lived up to the best English traditions in the proposals for the new government of the Transvaal which it laid before Parliament last week. Self-government on a fair and equitable basis it offers Englishmen and Boers alike. There are no special provisions to insure Anglo-Saxon domination, as had been expected by many. For the moment, the upper house is to consist of fifteen members appointed by the Crown; but arrangements will at once be made for an elective body instead. The guiding principle of manhood suffrage will also be embodied in the constitution for the Orange River Colony, which is in course of preparation. In short, within four years of the war, if Parliament agrees, the former Boer republics are to be as much in control of their own affairs as either Natal or Cape Colony. This plan attests both the courage and generosity of the Ministry. Mr. Balfour only echoed the words of the Jingo press in denouncing the scheme as premature and reckless. Kipling assumed, merely upon rumors of the Ministry's intention, that the Boers would be put in complete possession of their old country. The exact number of voters of British or Dutch ancestry is still in doubt, and the Ministry has had to face the possibility of Dutch control of the new lower house. This risk, if it exist, Sir Henry Campbell-Bannerman has had to take; he has entrenched himself firmly on the democratic principle that each citizen twenty-one years of age shall have a vote in the government of the country. The

magnanimity of this action recalling that of the North towards the South in our own country, should be a potent factor in hastening the return of peace and prosperity in a sadly harried and unhappy country.

Upon the question of servile and Chinese labor, the Government has also spoken out emphatically. At the moment of conferring power upon a majority, probably in favor of a continuance of Chinese slavery in the mines, it serves notice on all concerned that recruiting of Chinese labor must cease on November 15. More than that, the Constitution will contain a positive provision against servile labor of any kind. For this the blacks may well give thanks. It was high time for the Ministry to take this stand; in the ranks of its followers dissatisfaction with its handling of the Chinese question had long been rife. Of 50,000 coolies on the Rand, 1,311 are in prison, while lawlessness and disorder are steadily on the increase. Only the slaveholders—the mine-owners—are really satisfied with conditions as they are.

Parliament rose on Saturday, leaving the reputation of the Liberal Ministry heightened, on the whole, as a result of the labors of the session. There have been some signs of vacillation and even of disagreement in the Government, but the Prime Minister has kept a firm hand on the public business. It has moved on with great dispatch. The Cabinet has shown much more driving power than Mr. Balfour's had for the last year or two of its existence. While the routine bills have been handled skilfully, the various pronouncements upon public policy have been marked by grasp and consistency, and have been well received. The official Opposition, of course, has got up a great deal of manufactured fury, but the country has remained calm, even when Mr. Balfour was, as the Chancellor of the Exchequer said, tearing an artificial passion to tatters over the Education Bill. The change in Mr. Balfour is, indeed, an interesting study in psychology. Years ago, as Irish Secretary, he made his reputation as a miracle of coolness under the taunts and revilings of the Parnellites. As Prime Minister and Leader of the House, his favorite rôle was that of condescending daintiness, immovably amiable, indulging by preference in the superlative of under-statement. But now, in Opposition, he mounts to noble rage nearly every day, and is shrill and extravagant where he once would have been quietly sarcastic. Is this a sign of waning powers, or simply of a losing cause? Perhaps Mr. Balfour has felt it necessary to invent an impetuous anger to hurl at the robust impassiveness and downrightness of Campbell-Bannerman.

The Anglo-Indian *Pioneer* has undertaken to print the complaints of Hindus with reference to the "injustice and insolence" of the English in India. A correspondent of the Berlin *Tageblatt* supplies further details. Young officers are accused of being specially flagrant offenders. "In driving through the cities they ply their whips right and left, to clear the streets, without reflecting that thereby they arouse feelings which, gaining force from year to year, must end in an explosion." The educated Hindus are aggrieved because the English treat them with the same contempt as the coolies, refusing to eat or associate with them. They are becoming impatient, in proportion as they share the benefits of a European system of education, at the postponement of the day when they are to have a voice in the shaping of the country's policy. The German referred to is at a loss to understand the British attitude toward the educated Hindus. "I have become acquainted with a number of these," he writes, "whom I liked decidedly better than many an English snob or German official I have met."

M. Hertzstein, the member of the Duma who was assassinated on August 1, had gained prominence as an authority on the land question. He had drafted a project of law for the expropriation of unimproved holdings. "That little Jew in spectacles," was the contemptuous phrase of the landlords in referring to him. He at least showed the financial and constructive talent of his race. His was the bill which the Duma would have been most disposed to enact, had not the stroke of dissolution fallen. Hertzstein proposed that all lands not actually worked by their owners should be taken by the State "at a just price." In those words lay the rub. What was the "just price," and who was to fix it? The St. Petersburg correspondent of the Paris *Figaro* relates a conversation on this subject which he overheard between a landlord and Aladin, the peasant leader. The latter resented the charge that his party would take land without paying for it; were they robbers? Well, then, asked the landlord, "how about that property of mine in Cherson, which Catherine II. gave to my great-grandfather?" "Ah," replied Aladin, smiling, "for lands which your ancestors acquired without expense, the nation will pay nothing in resuming control of them. You will lose your property without indemnity. Justice wills it." One sees how thorny is the agrarian question in Russia.

Emperor William, in denying to a reporter of the Paris *Matin* that he is pleased at every report of scandal or disaffection in the French army, prob-

ably was thinking as much of Russia as of France. The meaning of his saying, "anti-militarism is an international pest," depends upon definition of terms; but it is certain that the spectacle of Russian autocrats doubtful of the loyalty of their own troops is one that causes uneasiness in military nations. As Anatole France has just said, "The Russian revolution is a universal revolution." Its rumblings are felt afar. Unorganized and leaderless as the present movement appears to be, with all its sporadic outbreaks, its haphazard bloodshed, and its strange lack of solidarity among the men of even a single regiment, it is of an earth-shaking sort. Doubtless Herr Bebel would say to-day with even more emphasis than he did a year ago: "The revolutionary storm which has broken out in Russia finds an echo in the heart of the German workingman." There is no present question, of course, of anything like serious disaffection in the German army. But if the report had been true that the Emperors of Austria and Germany had promised to lend the Czar troops to put down the revolutionists, there might have been a different story to tell. Happily, the report was promptly and officially denied at Berlin.

The length to which the Prussian bureaucracy will go in order to discredit the Social-Democrats, appears from a recent circular of the Prussian Minister of Education. In the event, he ruled, of any persons offering to give school children training in gymnastics free of cost, permission is to be granted if the applicant can prove his moral fitness to undertake that work. To this the Minister added: "The possession of any such moral fitness is to be denied in the case of all members of the Social-Democratic party." Naturally, the publication of this extraordinary document has called forth sarcastic comments. Writing in the Berlin *Nation*, Dr. Theodor Barth asks whether the next step should not be the "commandeering" of all children of Social-Democrats. If no one of the three millions belonging to that party is morally fit to teach gymnastics, surely not one is a proper person to instill correct ideas into the minds of growing children. Hence he suggests that the nation take and educate all children of a Social-Democratic father or mother. The Social Democracy has a larger number of voters than any other party, and, if we may judge by its success in the last three elections to the Reichstag, there is no reason to believe that its influence with the masses is waning. But, instead of cooperating with other parties in order to achieve definite reforms, or of turning for new recruits to other than the laboring classes, the Social-Democracy is wasting its time and strength in internal dissensions and theoretical discussions.

THE "IOWA IDEA"—AND OTHERS.

The outcome of the Iowa State Convention was highly characteristic of the ways of politicians. A contest had been bitterly waged for and against a principle. After a severe and dubious struggle, the friends of the principle won, controlled the Convention, took all the offices, and, apparently, threw the principle out of the window. In other words, Gov. Cummins had been savagely fought by the stand-patters, whom he in turn had denounced and attacked, but when he had them beaten and himself safely renominated, lo! the Convention adopted a stand-pat platform, the lion and the lamb lay down together, grace, mercy, and peace were hymned by all factions, and the only wonder of the bystander is what the long and envenomed quarrel had been all about.

It has certainly been about something. The long thunder of the captains in Iowa and the shouting could not have been caused by a desire to write such stand-pat platitudes into the platform as the Convention actually adopted. The fight was personal to Gov. Cummins, and on account of his pronounced views about the need of tariff revision. It was for this reason that Secretary Shaw journeyed so frequently to Iowa to make speeches and pack caucuses against Cummins. Shaw is the pattest stander of them all. Others, like Roosevelt, may be but half-pat, standing on only one foot, like a sleepy heron, and wondering where to put down the other, but the Secretary of the Treasury is always firmly planted with both feet on a tariff which it is sacrilege to revise. He had openly and repeatedly declared Gov. Cummins to be a heretic on the tariff—no better than a wicked Democrat—and for that reason had called upon faithful Republicans to excommunicate him. On his part, Cummins had not minced language. He had publicly and repeatedly asserted that certain tariff schedules were retained only in the interest of oppressive monopolies, and that the "robbery" committed by the Beef Trust and the Standard Oil was as nothing to the robbery of the people by a protective tariff. Yet he amiably accepted last week a platform of which the tariff plank was made of the familiar old punk-wood—duties to "secure remunerative prices," yet not to foster "domestic monopoly"; rates to be "adjusted from time to time," but only in a way to "keep the tariff in harmony with our industrial and commercial progress." We defy any Republican, not minus one or more of his senses, to repeat that ancient nonsense without laughing.

Are we to suppose, then, that Gov. Cummins is, after all, not a lion, but a sheep? Has he bartered his tariff-revision birthright for a mess of office? There will be some, doubtless, to insinuate that the Governor of Iowa was

insincere throughout, or that he was perfectly willing to say, cynically, that a renomination *vaut bien une messe* in the shape of a platform written by the stand-patters. But that would be a superficial interpretation of the result. In large effect, it was a great triumph for progressive ideas about the tariff within the Republican party. A good test of this is the position in which it leaves Secretary Shaw. He was hissed to his face in the Des Moines Convention last week. Observers on the spot report him to be "broken and discouraged" by the outcome. He had certainly staked his political future on beating Cummins. Beaten by Cummins, he will not be so ardent or confident in urging his own Presidential candidacy as the blindest of all the stand-patters. This of itself is a momentous consequence of the Iowa Convention; nor can it be supposed that Gov. Cummins will be inclined to modify, much less abandon, tariff views on which he has won a great victory. Not for nothing was his wing of the party called "progressives," as against the stand-patters. He represents an element of Republicanism ready to come out of the old tariff cave, with its owls and bats, and move on to a new policy demanded by the new times. Thus in its general effect the result in Iowa cannot fail to encourage those Republicans in New England and Indiana and Minnesota—there may be at least one in Oyster Bay—who are for having their party move next against tariff monopolists and restrainers of trade.

Certainly in Massachusetts, zeal for tariff reform seems to be seizing upon the Republican party. "We are all tariff revisers now," they say. They have not forgotten Gov. Guild's letter to the President last year, stating that the Republicans would have lost the State had it not been for their promises to reform the Dingley tariff. They are redoubling those promises this year, with what credence by the people remains to be seen. But the protectionists are visibly as much shaken in Massachusetts as they are in Iowa. Their wisdom has been simply that of the stronger—

The power is always theirs, and power is always wise—

and when once they find that the other side can carry conventions and win elections, they will discover that the time has come to improvise life-long convictions of quite another tenor.

HARVESTS AND MARKETS.

It was an English financial critic, we believe, who some years ago described the United States as "Nature's spoiled child." By this he meant that the recklessness of our financial and industrial experiments had been such as to invite the most serious penalty; yet an unexpected stroke of good fortune in American industry, or some development

that could not have been confidently predicted, had counterbalanced the excesses of our promoters and speculators, averted the threatened crisis, and eventually led the way to what seemed to be a still stronger economic position.

The industrial reaction of 1903, for instance, coming when our capitalists were tied hand and foot in rash indebtedness, seemed at the time to forebode a culminating stroke at overcapitalized consolidations and amalgamations. What happened was that a cotton crop in 1904 of wholly unprecedented magnitude, with the world's cotton prices at a level fixed by three years of scarcity, followed by an equally unparalleled crop of wheat in 1905, harvested and sold under very similar conditions, so enriched our interior communities that the home market for manufactured products became larger than at any previous time; while purchases by foreign nations, forced by their own inadequate supplies to buy in unusual quantity, served to cancel an excessive floating indebtedness of our own to them.

This good fortune could not have been safely predicted by the most sagacious observer; the events on which it depended were in fact pronounced improbable, in advance, by the great body of trade experts. No one has forgotten the debate of the cotton trade in 1903, whether it was possible ever again to raise such crops even as those of half a dozen years before. The weight of opinion leaned to the conclusion that it could not be done; exhaustion of the soil and insect pests put the achievement out of the line of probability. Prediction, at that time, that a cotton crop, 20 per cent. larger than the largest ever previously harvested, would be grown within a year, would have been received with ridicule. Yet that is precisely what happened.

So, in 1904, when a wheat crop of small size and poor quality forced us to import 3,000,000 bushels from other countries, many of the highest authorities in the grain trade pointed out evidences that our capacity as a grain-growing and grain-exporting state was destined to be progressively impaired. Good wheat land could, so one of the foremost English experts argued, no longer be obtained at reasonable prices; the older cultivated area was either being invaded by towns and cities or diverted to other forms of produce; the permanent fall of the United States to a minor position among the world's wheat producers was an early probability. Nature's answer to this fairly plausible theory was an American wheat crop, the very next year, never but once exceeded in the country's history.

These facts simply go to show that those venturesome experiments in the American money markets—which depended on exactly this agricultural outcome—were not saved from wreck by

events sagaciously foreseen. The same is true of the country's financial and industrial history of the current year. Last year ended and the present year began in the markets with a note of distinct and formidable warning. A reckless speculative undertaking, in which banks and great banking houses seemed alike to be engaged, had tied up large sums of capital at a time when it had become manifest that all available funds were needed for legitimate trade purposes. At the end of 1905, money touched 125 per cent. in Wall Street; in January, the New York bank surplus was at the lowest point, and money at the highest, reached in that month during twenty-six years. In April, when the Eastern banks ordinarily begin to strengthen their position, with a view to the later call for harvest money, bank reserves fell below the minimum fixed by the Banking Act—something which had not happened, at that time of year, since 1884. High financial experts disagreed as to the immediate cause. Mr. Schiff ascribed it to an inelastic currency; Mr. Hepburn, with whose conclusions the practical banking community seemed to be more closely in accord, placed the blame on "overtrading," absorption in land and stock speculation of capital urgently needed elsewhere. But whatever their general inferences, all financial authorities admitted that the known phenomena denoted a future full of danger.

Once more, however, Nature seems to have come to our relief. The season is nearly at hand when the country's important crops will be assured. Taking as a basis the Government's latest estimates of acreage and condition, there is promise of a wheat crop second in size only to the great yield of 1901, a corn crop fairly equalling last year's and far exceeding all others, and a cotton crop surpassed alone by the great yield of 1904. Accidents of the season are yet possible, and not all of this promise may be realized. But at the moment the situation is propitious; its importance, in offsetting the evil influences foreshadowed in the springtime, is very great. Such harvests would mean, first, continuance of high prosperity in our inland communities, and, with it, continuance of home demand on our manufacturing output; next, it would mean a full available surplus of agricultural exports, through which our market's heavy borrowings from Europe, at the time of the money disturbances of four months ago, may be paid off without serious strain.

Whether the situation is such as to admit of another plunge of our speculating bankers and capitalists is a different question. Their performances of last year were based on the theory that, with large crops of wheat and corn, and with profitable industry in progress, the

use of bank reserves in wholesale speculation was entirely safe. But it was not safe then, and would not be so now. The very richness of the present harvest promise points to unprecedentedly large demands from interior markets upon the country's reserve money and on its capital. The sums tied up in real estate speculation, over the entire country, are probably much larger than a year ago. Recourse of large corporations to issue of notes because they cannot easily market their bonds, and failure of such a security as New York city 4 per cents to bring more than a trifle over par, are signs that available capital is not sufficient for both legitimate industry and inflated stock speculation. One hears the Wall Street oracle answer that we can borrow from Europe. But serious financiers are well aware that our present concern is not to increase, but to reduce as rapidly as possible, a foreign floating debt which lately reached proportions possibly never before attained.

THE RELIGION OF SUCCESS IN POLITICS.

Guglieimo Ferrero, to whose occasional writings one seldom turns without getting suggestion based on learning and reflection, has a recent article on "The Religion of Success." This is not merely a variant of "The Gospel of Success." To preach the saving grace of "doing things" and "getting there" does not take one so far as it does to accept the doctrine and make of it an absorbing and sacred conviction—a religion. Yet this, Ferrero contends, is what the modern world is doing with greater unanimity every day. In department after department—education, theology, art, journalism—the *éclat* of success is not only the sufficient answer to every objection, but the thing which we are bidden to seek and worship before all other gods.

What Ferrero points out with much acuteness is that, particularly in politics, this religion of success is the source of great difficulties. It vitiates our political judgments. It disturbs the orderly development of political ideas and movements. For the causes of success in politics are exceedingly complex. They are often wrapped up in accidents and even blunders which baffle the most trained sagacity. Yet let there be great success, or the plausible appearance of it, and we instantly take up with some single cause, some sole explanation suggested, and thereafter reckon that cause and that explanation among the political certainties. Some extraordinary happening, some brute event, turns for the time the course of political history. We see a brilliant success snatched by chance, and we say, "That is the way it ought always to be done."

Military success is less subject than political success to causes which no

astuteness can foresee or impede. Yet even in it, with our tendency to reduce everything to the simplest explanation, we reason about a mere accident as if it were the essential thing. Rome beat Carthage, we say, because her government and her army were better organized. But should we have been so sure of that had we not the success before our eyes to persuade us of it? Suppose, writes Ferrero, that Hannibal had conquered, as he certainly came very near doing; would not the historians and the philosophers have shown how absurd it was to imagine that an army of which the generals were chosen by popular vote, and who were changed every few months, could cope with a force wielded under such an iron dictatorship as Hannibal's?

In politics, as we forgive everything but failure, so we pardon anything that succeeds. And we reason back from the success, of which the real causes are intricate and obscure, to some mere accompaniment, and then erect that into a canon of political activity. For concrete illustration, take the Hearst candidacy for Governor of New York. It would be as ludicrous as it is disgusting were it not that a specious argument from success can be made out in its favor. Hearst as a possible Governor would not be thought of by the wildest dreamer, or the most gullible romance-fed errand-boy, in this city, had he not run for Mayor last year and polled 200,000 votes. It is those votes which paralyze the reasoning power and dazzle the imagination, and lead even good men, not ignorant of Hearst's character and motives, to say, "Well, there must be a great moral force in him somewhere, otherwise he would not have come so near being elected." It is the religion of success at work. The actual causes of the great Hearst vote in this city were diverse and subtle. The campaign fell on a time of political upheaval. Unrest was in the air; revolt in men's hearts. Scores of thousands struck out blindly with the Hearst weapon, as they would with any club that came handy, not greatly caring that it was soiled. But we are to believe all the 200,000 devoted to municipal ownership, imposed upon by what has been aptly called the Hearst "yelling peril," taken in by his pose against the corporations; and we are gravely told that his canvass marks the beginning of an entirely new era in our politics! Yet if his vote had been but 20,000 instead of 200,000, none of these things could be true.

Those who would hold themselves steady against these insidious fallacies of political success should take a long look before and after. It is a tonic thing to remember how many great successes in their day have become the gigantic failures of history—the bursting rocket of the evening only the refuse in the

gutter the next morning. The pro-slavery politicians were for years the most successful men going. They had every sign of popular approval—the votes, the offices, the honors, the money. But they are sunk stars. Gone, too, and despised are explosive and passionate movements that had, in their little hour, the promise of sweeping everything before them—the Grangers, the Knights of Labor, the Populists. How long will it be before Hearst and Gompers are as forgotten as Denis Kearney and Powderly? The real religion of success must be based upon real success. And to the latter, reasoned principle and staunch conviction are as essential as they ever were. All the hysterics and the shameless self-advertising cannot change that. And the worshipped *causa victrix* of today may prove to be really *victa*, when history and the sober judgment of mankind finally get at it.

RELIEF WORK AT SAN FRANCISCO

In the confusion which followed the catastrophe at San Francisco, it was not to be expected that a system of relief could be instantaneously devised and applied which would meet the demand for both speed and precision. At first, the latter consideration had to be sacrificed to the urgency of the primal wants of 100,000 men, women, and children; and in the act there was no doubt a percentage of waste. The tremendous pressure caused many small leaks. But now, three months later, it may fairly be stated that the thousands who gave to the various relief funds may rest assured that their main object was attained and that, broadly speaking, people in the stricken city have not suffered for lack of food, shelter, or clothing; that there has been no serious waste; and that, as a result of generous assistance and the faithfulness of those in charge of a bewildering and thankless task, there is now available a large sum—more than \$5,000,000—for substantial and carefully constructive relief work.

Three weeks ago, the Rehabilitation Committee began giving money away with a discreet hand at the rate of about \$10,000 a day. Some 2,000 families had applied for assistance up to July 27, and of these nearly 1,500 were helped to re-establish their homes or businesses with grants varying from \$25 to \$900. Of the first \$104,249 thus disbursed, \$35,000 was in unsecured loans, \$600 in secured loans, and the remainder was given outright. Of the total amount accounted for in the first report on these particular operations, \$45,000 was credited to "household reestablishment" and \$28,500 to "business enterprises."

Possibly, had this distribution been begun earlier, much of the somewhat bitter criticism in San Francisco of relief methods would have been forestalled, and a debate about "scientific char-

ity" avoided. It was natural that Western and Eastern ideas should clash; but, as between the lavishness of the former and the caution of the latter, a fair middle course has been adopted. The petty depredations, always more picturesque than serious, such as the disappearance of a van-load of whiskey, or a consignment of some other relief supply, may be left to the local grand jury without further reflection than that the sneaks are always with us. Complaints of "red-tape" were inevitable, and events have shown that "red-tape" is not always an unmixed evil, especially when counterbalanced by a vigorous expression of the idea that the victims of such a disaster were not to be treated as ordinary applicants for charity. In the conditions prevailing it would have been a miracle if there had been no dissatisfied voices.

But the broad assertion that the relief funds have relieved can be made without fear of contradiction; and the tentative plans remaining are on a large scale. They include the expenditure of \$100,000 for a winter pavilion for the aged destitute; \$150,000 for park shelters for the homeless, also for the winter; \$500,000 for outright gifts to lot-owners to help them to rebuild; \$500,000 in loans for the same purpose; \$2,500,000 for cottages, houses, and flats to be sold at cost for cash or on the instalment plan. As the amount to be given away in cash or loans outright is \$1,500,000, the sum of \$5,250,000 is thus accounted for under six specific heads alone.

Alike to the Red Cross, the army, the Relief Committee, the Rehabilitation Committee, and the Mayor's Food Committee is due praise for hard and effective work, often under most disorganizing and discouraging conditions. In the practical task of the revival of the city, the professional politician, on the other hand, is increasingly present, with his schemes of "honest graft," which may frequently be more honestly called blackmail. Something to this effect has already come over the wires: as when saloonkeepers who desire a license are prompted to buy all their glassware from one politician and all their whiskey from another. The field is wide and the genus San Francisco "grafter" is a resourceful kind of highwayman. These things, however, should not be confused with the relief work, and the thousands who have given help have apparently no cause to fear that the native plunderers have been able, or will be able, to gather up more than a few scraps from the relief-fund table. But it will be well if the San Francisco editors cease to chastise any and all who, in the cause of progress, report the capers of the goats as well as the gambollings of the sheep. The leeches should not be protected from the widest obloquy by any false conception of civic pride. Nor should the greed of the labor unions,

taking advantage of San Francisco's necessity, be sparingly dealt with, any more than the kindred exactions of tariff beneficiaries.

On the part of the refugees themselves, whose numbers are daily lessening as they again become builders of a city, a prominent official observer remarks: "There has been an extraordinary amount of patience, moderation, and acceptance of incidental hardships and inconveniences." With such testimony as this regarding the spirit even of the most unfortunate of the people, there need be little fear that the still serious problems of the winter and the longer future will not be sturdily, if only gradually, surmounted.

WAVERING RUSSIAN AUTOCRATS.

The news from Russia continues grave—grave in the events occurring, more grave in the implications which lie behind. It is obvious that the rejoicing of the Government over the first comparative quiet of the country was premature. The dissolution of the Duma was accepted with a calm which Stolypin declared reassuring, but which was in reality ominous. It was inconceivable that the people who, a year ago, compelled the Czar to grant the Duma, would tamely see him withdraw what they had wrested from him. If agitation and disorder and the general strike were efficient weapons in 1905, when disaffection among the troops had not gone nearly the lengths which it has since reached, it could hardly be doubted that means of coercing the Government would be sought in 1906. Hence there should have been no surprise at the succession of protests, outbreaks, and mutinies. That they seem to have failed of their purpose, for the moment, argues no real breaking down of the national determination.

It seems evident that Stolypin's policy was impossible from the beginning. He called it "strong-handed reform." It was to be a mixture of iron repression and liberalism. Now, an amalgam of that kind might avail in certain hands, but not in those of an autocracy. A Liberal Duma, working out into self-consciousness, and struggling for the rights of the people, might make temporary compromises of that sort, and still press on towards its goal, while the people would be reasonably content. But a tyrannical Government has to do one thing or the other—give up its power, or use it ruthlessly. Both in the philosophy and in the actual grasp of the situation, Gen. Treppoff showed himself a year ago superior to Stolypin. In his secret circular to the police, he elected unhesitatingly the plan of Thorough. He said with much force, from the standpoint of an agent of autocracy and repression:

There is always a psychological moment, which, if not duly appreciated by the au-

thorities, paralyzes their action. If the military are not called out in time or not to the right place, and if they are used hesitatingly, if a meeting is imprudently permitted, if the leaders in disorder are seized too late—all this is a proof of the weakness of the authorities, and even at times of their complete incapacity.

We do not say that such a policy could have succeeded this year any more than last; but it was the only policy for a Czar, talking of his "Imperial will" as the sole basis of law or popular rights, to adopt. Whatever "psychological moment" existed for Stolypin, he lost in his wavering announcement that he would at once bayonet and bless the Russian people. Even the reactionaries, it now appears, will none of his two-faced policy; and another Premier must be found. Stark and unsparing repression might have for a time succeeded. Even in that case, however, the result of a Government triumph could only have been to revive Swinburne's description of Russian absolutists:

Those that crouch and shrink and shudder, girt with power—
Those that reign and dare not trust one trembling hour—
Those omnipotent whom terror curbs and drives—
Those whose life reflects in fear their victims' lives.

That sort of terrified reigning by terror might have been for a time possible for the Czar after he had been nerved up to send away the Duma; but without the resolution to resort openly and everywhere to blood and iron, he cannot expect that he will have even a respite for any length of time.

In fact, it may not be long before the Czar's own nobles and intimates will be telling him that he confronts again the impossible conditions of last summer. They then went to him, a month before he issued his proclamation summoning the Duma, and informed him in the plainest language that he was guiding Russia towards ruin. They told him that distrust of the Government was universal, and that all its moral force had disappeared. The peasants, they declared, were taking the law into their own hands, "knowing that the authorities have neither prisons nor soldiers enough to cope with the whole population." Under such circumstances, to postpone concessions to the people was only postponing a revolution which, by the very delay, would be only intensified in its "bloody remorselessness and mad ferocity." Whether the great landlords and the nobility will have the courage again to utter these unwelcome truths to Nicholas, we do not know; but the course of events during the past few days has been thundering them in his ears.

How long shall it be before American sympathy finds an effective manner of expressing itself? There is, we believe, a committee in process of formation, and if it does nothing but voice popular

sympathy, it will be of value. On the initiative of some London editors, Lord Brassey, Frederic Harrison, George Meredith, the Rev. Stephen Gladstone, and many others have signed a memorial to the Duma, which reads in part as follows:

We have learned to admire the genius of the Russian people; the heroism of its sacrifices for freedom and its sufferings in a long and painful struggle have touched the heart of every generous man. The complete triumph of liberty in Russia, to which we look forward at no distant date, will at length make it possible for the English and Russian peoples to give formal expression to the friendship already uniting them, a friendship based on community of ideals, which must help to realize the aspiration of all good Europeans for a civilization devoted to peace.

But the Russians need more than messages of sympathy. Think of the Jews. A writer in the *Westminster Gazette* says that "during the past week a stream of frantic telegrams has poured unceasingly into the Jewish communities of London, Paris, Berlin, and Washington—one long-drawn, terror-stricken cry for help from five millions of men, women, and children threatened with fire, sword, and dishonor." Day by day they face the danger of massacres, instigated for no other purpose than in the vain hope of "drowning revolution in Jewish blood," as Plehve is reported to have said. If the sight of the Russian people in travail is not enough to stir Americans, then the additional horror of the Jewish situation should move every heart and also loosen purse-strings as soon as it is possible to say where funds should go to aid in the work of relief and liberation.

ATHLETICS FOR THE AGED.

With the "silly season" in England has arrived the inevitable *questionnaire*, this time on the proper ages for the various outdoor sports. Professor Allbutt of Cambridge started the discussion by declaring that no one should be permitted to play golf until thirty-five, being capable before that time of the more vigorous games. According to this view, the active age stops, in Dante's words, "midway in the path of our life." A number of prominent British athletes, whose opinions have been tabulated and averaged, took a more hopeful view. Football, to be sure, should be dropped at the mere nonage of thirty, but hockey may be played till thirty-five, cricket five years longer, while one may row and play lawn tennis till sixty. These limits, naturally, apply to amateurs, and not to professionals, who frequently continue into grandfatherhood with athletic value unimpaired.

Waiving for a moment the grievous dictum that makes the ancient game of golf merely a solace for declining physi-

cal force, it is clear that these average ages of retirement are in a manner misleading. Did not the great cricketer, W. G. Grace, celebrate his sixty-eighth birthday recently by making seventy-four runs? A few years ago, when the friends and admirers of the eminent scholar, Dr. Frederick J. Furnivall, wished to signalize his seventieth birthday, they could think of no more suitable gift than a fully rigged double scull; and it is safe to say that few even of the younger subscribers could safely have engaged to pull bow to his stroke from Richmond to Teddington. Nor should we forget that other septuagenarian who not long ago beat his youthful record in walking from Philadelphia to New York. Evidently, there are some who pass these theoretical dead-lines, not only with impunity, but with positive benefit. But for the generality, the figures may afford a rough and ready guide.

Yet the question of retirement is, after all, a two-fold one. A sport, we fancy, is very rarely given up for hygienic reasons. We drop out not because the recreation has ceased to please or the exercise to benefit, but because our game begins to go off. Finding ourselves at a disadvantage with the youngsters, overhearing that we play well "for our age," we decide no longer to cumber the field. Thus, on a punctilio, many a sportsman takes really a premature farewell of his favorite pastime. We judge that the table given above is based rather on a sense of what is good for the sport than for the individual player. Fortunately, the scale admits of a gradual descent to senility by way of golf, which knows no age limit, but merely regards the grave itself as a sort of nineteenth hole. Some have said that when all else failed one might at least hold a tiller, but the case of the gentleman who was stricken last week at the wheel of a friend's yacht, hints that the cockpit is no safer than the putting green.

For golf as an old man's game, there is unquestionably much to be said. It requires that abundant leisure which in the active years demands some apology; it deals gently but firmly with those organs immediately below the diaphragm, whose torpidity is the very sign-manual of approaching eld. It may be taken up without risk by anybody who can walk two miles in one hour; and it may be relinquished without that ominous going off physically which dropping the more active games often entails. But in the case of golf, too, one must face the inexorable dilemma of what is good for the player and for the game. There is no doubt that golf is good for the old gentlemen, but how good are they for golf? In the way of suppression or manipulation of scores, they are prone to set an awful example. They are given to threesomes and to sociabilities en-

route that delay the progress of all following matches; they are not above small evasions, being averse to the "sand iron," often "dropping for one," when a true golfer goes down into the pit. Old men have been detected teeing up by mutual consent in the bunched season of early frost. In short, their attitude is generally opportunistic, and few of them are above the suspicion of playing merely because it is good for their health. A doctor's prescription lurks in the pocket where the score-card should be.

Were golf restricted to men over thirty-five years, according to Professor Allbutt's decree, we should still retain many of our best players, but what a loss of idealism there would be in the game! We have hinted already that the severities of the code are maintained chiefly by the effort of high-minded youth. Even more, the too much discredited ideal of "form" depends upon mastering "stance" and "swing" in tender years. The stern fact of repeated victory by players who have no form to speak of has given the game a go-as-you-please quality. Yet we presume there are a few faithful who still regard the often-beaten Findlay Douglas as the most finished American golfer—the model and exemplar of graceful and effective play. No one whose muscles have stiffened—assuredly, no one whose stomach has "gone down"—is likely to master this admirable slashing style, the possession of which is almost more than that of infinite mugs and medals. Golf emphatically needs the old men, quite as much as they need it; but it also needs the steady infusion of young blood, if only that the beautiful style of the "old school" may not utterly yield to the stodgier mechanics of middle and later years.

A COLONIAL AUTOCRAT.

SYDNEY, July 5.

It can seldom happen that the passing away of a colonial public man is an event of sufficient moment to deserve the attention of readers at so great a distance; but the death of the Premier of New Zealand, a fortnight ago, occurred under circumstances so awe-inspiring, almost so tragic, and he was himself so striking a personality, with a career so remarkable, that a noticeable blank would be left in these letters recording the political evolution of the Australasian colonies, if it were quite ignored. Mr. Seddon had been officially invited to visit Australia, as a sovereign might have been invited, and from the day that he landed in Sydney till he took his departure, he was fêted like a king on a royal progress. He was banqueted; he made innumerable speeches; he was interviewed by the representatives of every progressive movement; he honored Australian institutions by merely visiting them; and he wound up by negotiating a treaty of commerce between the commonwealth and New Zealand. Then, when the steamer that bore him away from these shores was hard-

ly out of sight of land, the indomitable will that had never once in a lifetime relaxed its grasp, gave way, and, like Scott's Queen Margaret of Anjou and many an obscurer individual, he fell suddenly dead. It was the most glorious of endings—a "death at Trafalgar." The ship that was carrying him back in triumph was converted into a funeral barge—"Home they brought their warrior dead." He was laid to rest on a commanding eminence, looking down on the scene of his legislative victories, after an international funeral, in which England and the United States, as well as Australia and all New Zealand, may be said to have participated, and where the dramatic laments of the Maoris for their Great White Father were blended with the heartfelt grief of a whole people. It was the colonial parallel to the exequies of Gladstone—as Sir James Stephen insisted that the old Latin word should be written. Mr. Seddon was wont to say that the colonies did not sufficiently honor their distinguished men. They have signally falsified the saying in his own instance. They idolized *him* in his lifetime and are worshipping him in his death.

Three memorable lessons, out of many, may be drawn from his extraordinary career.

Mr. Godkin has impressively remarked on the revolution that took place in American politics when education and social standing ceased to be required of candidates for a legislature. Mr. Seddon was a member of the Ministry that marked the accomplishment of a similar revolution at the Antipodes. Till 1891, New Zealand ministers had usually been distinguished for academic rearing, social rank, or eminent public services. The theory involved was then apparently supplanted by another theory—that every citizen is fit to be a legislator, that every legislator is fit to be a minister, and that every minister is fit to be premier. At all events, ministers were now first chosen from the rank and file. The results were startling. An itinerant dealer became premier, and projected a daring policy of State socialism. A Highland shepherd became Minister of Lands, and took the first steps or strides towards the nationalization of the land. A journalist became Minister of Labor, and established a system of industrial arbitration. These were great achievements, but they were all destined to be eclipsed by the exploits of the Minister of Works, who carried still further the Socialist policy of his predecessor, closely linked his colony with the fortunes of the Anglo-Saxon race, and raised New Zealand to be the second country in the empire after the mother land. Richard John Seddon seemed an unpromising person to be the executor of such a programme. Successively an engine-driver, a storekeeper, and a publican, he was but half-educated and wholly devoid of culture. Talent he seemed to have none. It was long before he could properly express himself. His style of both speaking and writing gradually improved, but to the last his English was often bald, clumsy, and uncouth, and he never possessed the faculty by which Gladstone and Disraeli, Webster and

Clay, exalted every topic they touched upon. What made him the man that he became? The same things that made Abraham Lincoln one of the greatest of American Presidents—the acquisition of power and the assumption of responsibility. He issued victorious out of every battle that he fought, and the strength of every rival he defeated entered into him. Accident had made him premier, and accident continued to befriend him. Like Crispien, he gained consideration at home by acquiring prestige abroad. He was the first of the colonial premiers to set foot in England on the occasion of Queen Victoria's "diamond jubilee," and he captured the British public by his *aplomb*, the vigor of his utterances, and the robustness of his character. Coming back to New Zealand aggrandized, he was acclaimed "King Dick," another Richard the Lionheart. Serious illness threatened him, but, heroically battling down two strokes of paralysis, he showed an unbroken front to his enemies. Indeed, opposition gradually died away, and he was kept in office by overwhelming majorities.

Albert Sorel and other historians have shown from a mass of contemporary evidence that Napoleon tyrannized over France with its own consent. Mr. Seddon despotized over New Zealand with its cordial coöperation. He wielded unlimited authority. The whole political machine was moved by his will. As the English secretary of state was originally the private secretary of the sovereign, the colonial secretary in British colonies was originally the private secretary of the governor. Introducing a species of political atavism and substituting himself for the governor, Mr. Seddon converted his colleagues into his private secretaries. Their measures, their bills, their appointments even, were his. He held two successive governments—English noblemen!—under his sway, neither of them venturing to oppose any of his demands; and he wrote of "my government," as the governor used to speak, and as the King of Spain still speaks. The recent history of New Zealand furnishes the most striking proof of the proposition that, under the forms of parliamentary government, a free country may be ruled as Bismarck ruled Prussia, or even as Metternich ruled Austria.

It was in perfect consistency with his domestic policy that Mr. Seddon should be the chief fugleman of colonial jingoism. In his first speech in England he sounded the keynote of all the speeches afterwards made by the colonial premiers. He intimated that, if danger threatened or war broke out, England would "find the colonies behind her." He offered their support to the Motherland and virtually encouraged it to plunge into war. The declaration was duly noted, and the South African war was engaged in on the understanding that the colonies would take part in it. But for their unflinching advocacy and interested participation, it might never have been undertaken, and it would certainly have languished. The injury Mr. Seddon thus inflicted on his native land was grave and doubtless irreparable. He lived long enough to regret it. When the importation of Chinese to the gold mines of the Rand was sanctioned by the British Government, he plainly informed it that, if the retrograde policy was persisted in,

there would be "a revulsion of feeling." It was too late; the mischief had been done. Hegel stated, and, sorely against his will, Mommsen proved, that the conquest of the provinces had reacted injuriously on the constitution of Rome and the Roman character; while Zeller has shown how deeply it corrupted the old Roman religion. The reaction of free colonies on the motherland should make for freedom, and in general it has so made; but in one or in two directions it has been disastrous. It has nursed the passion of conquest, and it has not fostered the sentiment of public justice.

In his last days Mr. Seddon declared that he was neither socialist nor anti-socialist. Misusing a word which, with its congeners, "humanity" and "humanities," has been often abused, he dubbed himself "a humanist." His sole public end, he asserted, was to promote the well-being of his fellows. It was no idle boast, if good intentions only were reckoned; but his methods were those of Socialism. Leave out womanhood suffrage and a stringent licensing act, which he passed at the point of the bayonet, and one continuous scarlet thread is perceived to run through all his measures. They substituted the collective action of the State for private enterprise, individual or associate. He strengthened the system of State industrial arbitration. He repurchased vast tracts of private lands, which are partially retained by the State. He established old-age pensions—his masterpiece. He added a life-insurance branch to the Government fire-insurance department. He built hundreds of workmen's cottages, with the result of inflating the market price of the surrounding land and thus defeating his own object. And he announced a gigantic scheme of national annuities, which was to place the coping-stone on his political career. It will be laid by other hands, but the adoption of his measures by one Australian State after another shows that, if an ambitious minister desires to gain and hold for a lifetime the secure tenure of autocratic rule, he should initiate and pursue a policy of State Socialism. Correspondence.

JEWISH SYMPATHY FOR ANIMALS.

TO THE EDITOR OF THE NATION:

SIR: Authorities go and authorities come, but authority abideth forever, was my involuntary exclamation when I read the brief notice in the *Nation* (No. 2142), regarding the callous attitude of Judaism and Christianity toward the "little brothers" of men. The authority of Schopenhauer is invoked for the unqualified statement, that these two religious systems were oblivious of duty toward dumb creatures. When a modern writer inclines to pick a flaw in the mentality of a mediæval predecessor, he charges him, as a rule, with blind adherence to authority. The reproach is, that before the modern spirit of inquiry was abroad, all moot points were settled by merely quoting the dictum of some great man. Apparently we are no better off to-day, unless it be an advance to swear by Darwin rather than Moses, or

have Kant crammed down our throats instead of St. Paul. For my part, I cannot call it other than blind adherence to authority, to rest satisfied with an *ex cathedra* statement by Schopenhauer, that Judaism has no regard for the feelings of the brute creation.

If, instead, the elementary method of consulting the Bible itself were adopted, we should find reason to wonder at the abundance of legal provisions, rather than their paucity. The humane institution of a day of rest embraces the beast of burden in its beneficence; the fourth commandment bids cessation from work on the Sabbath for the sake of one's cattle. A still more characteristic expression of feeling is in the verse that forbids the muzzling of the ox while he is treading out the corn. The Jewish law, however, goes farther; it prohibits castration, and thereby imposed great sacrifices upon an agricultural community. But the highest degree of tenderness and sympathy with brute life is implied in the Biblical injunctions that recognize and guard the relation of the mother animal to the offspring; a nest may not be robbed of the dam and the fledgling birds at once; a cow or ewe and her young cannot be slaughtered for a sacrifice on the same day; and three times the Mosaic law warns against seething the kid in its mother's milk.

So much for the Biblical law. As for post-Biblical Judaism, if it knew no such institutions as Societies for the Prevention of Cruelty to Animals, the reason may be that they were made superfluous by the stringency of the law. The stranger desirous of sojourning among the Jews had to take upon himself a minimum of observance, and this minimum included the prohibition against rending a live animal and eating its flesh, a demand so rigorous that the early Christians laid stress upon it (Acts xxi. 25). The rabbis would not permit animals to be tortured even for the purpose of obtaining medical remedies. Except as a measure of self-defence, the chase is unthinkable in the Jewish system. About a hundred years ago, a very wealthy Jew plied a celebrated rabbi, Ezekiel Landau of Prague, with questions as to whether the prohibition against hunting could not be modified in some way. The rabbi gave reins to his astonishment, that a Jew could desire to take the life of dumb creatures wantonly, and esteem it a pleasure at that.

That the law was not a theory, but the practical and direct expression of the popular conscience, is demonstrated by legend and proverb. A pious husband and wife long remained childless. They begged a saint who chanced their way to pray for the removal of the curse from them. He answered: "If you will so place the watering trough that even the young chicks can quench their thirst, you will have cause for complaint no longer." And so it was: sterility had been their punishment for heedlessness in the treatment of the animals under their charge. And the whole case for Judaism, which has not been half stated in the above, was pithily compressed into one sentence by the wisest of kings: "A righteous man regardeth the life of his beast" (Prov. xii. 12).

LOUIS GINZBERG.

Jewish Theological Seminary of America, New York, August 6.

[We gladly give space to this interesting letter. Our note, however, while alluding to Schopenhauer did not erect him into an authority, nor was any attack made upon Jewish ethics.—Ed. NATION.]

THE HOUSING OF EMPEROR WILLIAM'S GIFTS TO THE GERMANIC MUSEUM.

TO THE EDITOR OF THE NATION:

SIR: The *New Yorker Staats-Zeitung*, in an editorial of July 7, stated that the manner in which the gifts of Emperor William to the Germanic Museum of Harvard University had been received by the Harvard authorities seems to show that the Emperor's generosity had entirely failed of proper recognition in this country. For, it said, in effect, these splendid casts of monumental German sculptures were stowed away in a dusty old barn; and as for making use of them for the study of the history of German art, that was entirely out of the question, since nobody took any interest in them.

As long as these perversions of truth were confined to the columns of a single newspaper, I thought it best to ignore them. Now, however, I learn that a recent dispatch of the Berlin correspondent of the *London Standard* reports that these statements have been copied in the Berlin papers, and have led to a good deal of indignant comment on American ingratitude for German favors, and to the expression of the hope that the Emperor would in the future refrain from such acts of generosity towards America.

Under these circumstances, I consider it my duty to declare that the accusations of the *Staats-Zeitung* are absolutely false and sheer fabrications. The building in which the collections of the Germanic Museum are temporarily installed is small and unpretentious, but it is admirably lighted and well adapted for exhibition purposes. Every one of the monuments exhibited (including the gifts of the German Emperor) is brought into clear view and can be studied in all its details. No one is more desirous than the Harvard authorities of having a sufficient sum of money raised for the erection of a large and monumental museum building; and repeated efforts have been made in this direction. The latest of these efforts consisted in collections for an "Emperor William Fund," intended as a permanent endowment for such a building. About \$25,000 has thus far been subscribed for this fund; but we need more than ten times this amount before we can think of breaking ground. It is very much to be desired that the German-American press, instead of reviling what has been accomplished thus far, should help us in carrying out these wide-reaching plans.

As to the interest taken in the museum by the public, it is sufficient to say that since November, 1903, the time of its formal opening, the museum has been visited by some 70,000 persons, although it is regularly open only on two entire days and two afternoons of the week. Lectures on mediæval German sculpture are regularly given in the museum to advanced students. A handbook describing in detail the objects exhibited is at present in the press and will appear shortly.

KUNO FRANCKE.

Harvard University, August 6.

STUDY FROM THE NUDE.

TO THE EDITOR OF THE NATION:

SIR: The recent seizure in New York on a warrant sworn out by the secretary of the Society for the Suppression of Vice, of a publication of the Art Students' League entitled the *American Student of Art*, suggests some considerations that appear to be too often overlooked in connection with the study of the nude figure in academies of art.

Whatever may be the need of practice from the nude for the exceptional few who have capacity and elevation of mind enough to make proper use of it, such practice is in no way essential in the training of the average student of art. Considered as discipline, for any ends that these students can compass, the study of any other natural organic form is as useful as that of the human figure. The student who does not find beauty in a spray of leafage will not perceive it in the Venus of Melos.

But, however this may be, there can be no justification for parading in public the crude effigies of inelegant naked academy models. These belong in the students' portfolios, if anywhere. They are not works of art, and have nothing to commend them to public attention, while as mere display of nudity they justify the action that has been taken.

It is only when chastened by exalted feeling, and the highest artistic treatment, that the nude in art is ever justified. The nudes of academy students, and of the rank and file of professional painters, seldom rise above the coarseness and uncleanness of those of Parisian Salons.

CHARLES H. MOORE.

Harvard University, August 4.

Notes.

Harlow N. Higinbotham, who was for many years a partner of Marshall Field, has prepared a book on "The Making of a Merchant," which will be published in September by Forbes & Co. of Chicago.

Dr. Hugh Black, who is coming to New York to occupy the chair of Homiletics and Pastoral Theology in Union Theological Seminary, has ready a volume of sermons which will be issued by Fleming H. Revell Co.

Next week Henry Frowde will publish Mary Wollstonecraft's "Original Stories" for children in the Oxford Library of Prose and Poetry. The volume will contain the five illustrations by William Blake, and an Introduction by E. V. Lucas.

We have so often pointed out the excellent features of the First Folio Edition of Shakspeare, edited by Charlotte Porter and Helen A. Clarke, and published by Thomas Y. Crowell & Co., that nothing remains to be said about the latest volume containing "Twelfth Night, or What You Will."

Frederic C. Howe, whose book, "The City the Hope of Democracy," was recently reviewed in the *Nation*, has a new volume ready, called "The Confessions of a Monopolist." Two of the chapters were published last year in the *World's Work* as "Confessions of a Commercial Senator." The

work as a whole will soon be issued by the Public Publishing Company of Chicago.

John Addington Symonds's "Walt Whitman, a Study," is published by E. P. Dutton & Co. in a single small volume. It is a curious contrast to turn from Symonds's panegyric of Whitman to the somewhat embarrassed attitude of Whitman toward his admirer, as shown in his recently printed conversations with Horace Traubel.

Burke's works are to occupy six volumes in the *World's Classics*, published by Henry Frowde, the first volume being now before us. To compress into a single book of pocket size the four treatises, viz., "A Vindication of Natural Society," "The Sublime and Beautiful," "A Short Account of a Late Administration," and "Observations on 'The Present State of the Nation,'" means pretty small type, although, as in all these volumes, the page remains quite readable. Judge Willis furnishes the General Introduction.

E. P. Dutton & Co. have ready for publication a volume whose title runs: "Empires and Emperors of Russia, China, Korea, and Japan; being notes and recollections of Monsignor Count Vay de Vaya and Luskod." The English publisher, John Murray, has added a preface in which he relates the Count's signal work for the Catholic Church in remote places of the earth. Another book announced by E. P. Dutton & Co. is a volume of fifteen stories by George Gissing, called "The House of Cobwebs and Other Stories." This completes the edition of Gissing's works, and contains a long introduction on the author by Thomas Seccombe.

From the autumn announcements of G. P. Putnam's Sons the following titles may be noted: "The Ohio River," by A. B. Hulbert; "The Connecticut River," by E. M. Bacon; "Romance of the Italian Villas," by Elizabeth W. Champney; "Cathedrals and Cloisters of the South of France," by Elise W. Rose; "Winged Wheels in France," by M. M. Shoemaker; "The Story of Old Fort Johnson," by W. M. Reid; "Hunting Big Game," by W. S. Thomas; "On the Great American Plateau," by T. M. Prudden; Mrs. Gaskell's Works, Knutsford Edition; "Madame de Staël to Benjamin Constant," unpublished letters and other mementos; "Essays of Sir Leslie Stephen," in eleven volumes; "The Censorship of the Church and Its Influence Upon the Production and Distribution of Literature," by G. H. Putnam; "Shelburne Essays, Fourth Series," by P. E. More; "A Literary History of the English People," vol. ii., part i., by J. J. Jusserand; "The Poetic Movement in England," by Stopford A. Brooke; "The Gate of Death"; "The Heart of Hamlet's Mystery," by Karl Werder; "Tacitus and Other Roman Studies," by Gaston Boissier; "Thomas à Kempis and the Imitation of Christ," by J. E. G. de Montmorency; "Montaigne" and "Molière," in "French Classics for English Readers"; "The Life of Goethe," vol. ii., by Albert Bielschowsky; "Princess and Court Ladies," by Arvéde Barine; "The Greatness and Decline of Rome," by G. Ferrero; "Five Fair Sisters," by H. Noel Williams; "George Herbert and His Times," by A. G. Hyde; "David Garrick and His Circle," by Mrs. Clement Parson; "Memoirs of Comte de Rambuteau," by George Lequin; "History of the People of the

Netherlands," Part iv., by P. J. Blok; "Madame Recamier and Her Friends," by E. Herriot; "The Roman Empire," by H. Stuart Jones; "Gettysburg and Lincoln," by H. S. Burrage; "The Union Cause in Kentucky," by Thomas Speed; "A Spinner in the Sun," by Myrtle Reed; "A Draught of the Blue," by F. W. Bain; "Shibusawa," by I. W. Adams; "The Sword of Wealth," by H. W. Thomas; "The Saint," by A. Fogazzaro; "The Man of Property," by John Galsworthy; "The Culture of the Soul Among Western Nations," by P. Rámanáthan; "The Evolution of Religions," by E. Bierer; "The Acts of the Apostles, etc.," by H. P. Forbes; "The Hebrew Religion to the Establishment of Judaism Under Ezra," by W. E. Addis; "The History of Painting," by R. Muther; "The Development of Modern Art," by J. Meier-Graefe; "English Coloured Books," by M. Hardie; "Enamels," by H. H. Cunyngame; "Goldsmiths' and Silversmiths' Works," by N. Dawson; "The Essentials of Æsthetics," by G. L. Raymond; "History of English Furniture," vol. iii., by P. Macquoid; "The Power to Regulate Corporations and Commerce," by F. Hendrick.

In pure literature the "Life and Letters of Lafcadio Hearn," now definitely announced by Houghton, Mifflin & Co. for the autumn, ought to be the most entertaining volumes we shall have for many a day. Mrs. Elizabeth Bisland, the author, knew Hearn intimately for nearly thirty years, and had the advantage of seeing him in many of his different environments. The bulk of the two volumes is given up to Hearn's correspondence during a period of thirty-five years. Hearn was a voluminous letter-writer, eloquent and witty, and his personality had that idiosyncrasy which makes such writing interesting.

Bordeaux has bethought herself that she once had a mayor named Michel de Montaigne, and, as a municipal enterprise, has undertaken a definitive edition of the "Essais," of which the first volume has appeared. The complete text is, of course, to be given, and variations of type are to show the epoch to which each passage belongs; while notes will register the most trifling variants. Professor Strowski of Bordeaux University has editorial charge.

The *Quarterly Review* comes out strong in history and government and rather weak in pure literature. In the former division it ranges through a review of "England in the Mediterranean," "Northumberland," "John Knox and the Reformation," "The Oxford Movement," "The General Election in France," and other outlying subjects. Perhaps the article that will arouse most argument, at least among a certain group of readers, is Robert Dunlop's "Origins of the Irish Race." According to the general view we are told to regard the ancient Irish as a homogeneous race, of Celtic origin, who brought to Ireland their own arts and institutions, and developed them uninterruptedly until the arrival of the Danes and Anglo-Normans arrested and finally put an end to a civilization which otherwise might have grown to something great and permanent. To each of these statements Mr. Dunlop opposes a direct negative, with a fairly formidable array of arguments: "First, then," he says, "there is every reason to believe that the ancient Irish (using the words in the sense of Dr.

Joyce) were not a single, homogeneous, nor in the main a Celtic people; secondly, we have good grounds for concluding that when the Celtic or, more probably, Celtiberian conquerors arrived in Ireland they found the inhabitants of the country in a comparatively well advanced state of civilization; thirdly, there are good reasons for regarding the Celtic or Celtiberian conquest of Ireland as the work of a relatively small body of invaders, resembling the Norman conquests of England and Sicily; fourthly, there is little doubt that Irish Christianity and what is called 'late Celtic' art are essentially Eastern in their origin and have little or nothing to do with Rome or Constantinople; fifthly, there is little question that the Danish invasions (apart from mere acts of piracy) served rather to develop Irish civilization and increase the chance of national unity than the reverse; and, finally, we hold that Irish civilization perished of its own effateness and inability to stand against a superior and more highly developed civilization."

The *Edinburgh Review* for July contains three articles on French subjects, all, in one way or another, interesting. One deals with Alfred de Musset, devoting a good deal of space to the now sufficiently vulgarized episode of the poet and George Sand, but giving it some relief by a clever contrast of the two characters. George Sand the writer of the article calls a "Byronic woman with *un point* of Ibsen"—a capital phrase. A second French paper is on Descartes as the "Representative Philosopher," taking up a number of recent books on the subject by Miss Haldane and others. "He sought," says the article, "to be alone rather interiorly than exteriorly; perhaps, on the whole, he preferred the solitude of the Hall to Eblis to the solitude of the desert under the silent stars." The writer necessarily dwells on the famous *Cogito, ergo sum*, but he does not point out clearly how the over-intellectualism of modern philosophy starts with this false emphasis of *cogito*, and how much of the egotism of modern literature is forshadowed in the *sum*. A third French paper, on "Illuminism and the French Revolution," we may pass over.

The *Library* for June offers a symposium of contributions to the memory of Richard Garnett, the keynote being very happily struck by Austin Dobson:

Of him we may say justly—Here was one
Who knew of most things more than any other;
Who loved all learning underneath the sun,
And looked on every learner as a brother.
Nor was this all. For those who knew him knew,
However far his lore's domain extended,
It held its quiet "Poet's Corner" too,
Where mirth and song and irony were blended.

The other writers recur to the same traits; his kindliness, the universal scope of his learning, his happy gifts as a writer in prose and poetry; and the feeling of personal loss is notable everywhere. Mr. Pol-lard suggests the possibility of evolving by coöperation a sort of composite biography (which would be different from and on a higher plan than the ordinary biography)—lest "his reputation may attract to itself many of the Joe-Millerisms of librarianship." Alexander Hill takes a somewhat new angle of the fiction question in his article on "Responsibility for the Public Taste." He takes the ground that the inexperienced reader needs protection against bad and stupid writers, who, he says, have

opportunities denied to the public speaker. "Is the public the best judge of what is good for its moral and intellectual health?" Mr. Hill thinks not, and he has a seventeen years' experience as chairman of the National Home Reading Union to back up his assertion. Librarians, he holds, should be not only receptive, they must, if they understand their responsibilities, be aggressive in attracting attention to what is good. Mr. Hill suggests three means of doing this: "(1) the display of books bearing upon subjects which are at the time occupying the public mind; (2) talks on books by persons who know their subjects, and who have taken the trouble to look out the books in the library which will enable others to follow in their steps; (3) the formation of public reading circles, meeting in the library, for the purpose of coöperative study and discussion."

Reinhold Begas, probably the greatest German sculptor, having just passed his seventy-fifth birthday, the press is full of stories of his rich and interesting career. A personal friend of Bismarck's, he had occasion to make several statues of him before the Chancellor's death, for which Bismarck gave him some sittings. Impressed, like every one else, with those wonderful eyes of the man of blood and iron, Begas exclaimed once as he worked: "Your eyes, your Highness, are as if they could gaze upon several countries and overlook everything!" "Overlook everything," retorted Bismarck; "that is not a compliment to pay to a diplomat!" Ten weeks before Bismarck's death, Begas appeared at Friedrichsruh to get a final impression of Germany's most striking figure, before beginning work on the great Bismarck monument voted by the Reichstag. When Begas stated his mission, Bismarck replied: "Gott, why do you wish to set me a great monument? Represent me as being on crutches!" When they parted, Begas, feeling that the farewell was final for this world, tried to kiss Bismarck's hand, but the Chancellor waved him off, and then embraced him with deep feeling.

In connection with the celebration by the University of Turin of Cesare Lombroso's jubilee, his daughters, Paola and Gina (Mme. Carrara and Mme. Ferrero), published a little volume giving a modest account of their father's life and work. A chapter containing details of his *vie intime* has amusing stories. Never was there a better impersonation of the traditional *savant*—absent-minded, whimsical, frank, kindly, and always dwelling in the moon. On one occasion in Rome, being without an overcoat and being instructed by his daughters to buy one, he was found in the streets with a huge and shapeless bottle-green affair, dragging after his heels, which he had blinkingly purchased from an unscrupulous street peddler. Tales of the *enfant terrible* order are told of him. Once his daughters were very reluctant to go with him to call upon a stupid lady of their acquaintance. Lombroso finally persuaded them to go, and then burst out as follows to their astonished hostess: "I have had the deuce of a time in getting these foolish girls to come with me. They always do dread being bored! But I promised them that we should hurry to eat some of your cakes, and then go away immediately!"

Charles Edward Garman, professor of philosophy at Amherst College, has for a quarter of a century played a somewhat unique part in our American academic system. To "publish," to pursue "original investigation," has during that time been the ideal that most of his compeers have aspired to; but he, with as good capacities for that sort of thing as any of them, has unswervingly devoted all his energies to being an inspiring teacher; and his "publishing" has only been of pamphlets for the use of his successive classes. The results have been extraordinary in their effect, not only on the intellect, but on the character of those who have come under his influence. His pupils, many of whom are now academic personages of importance, have thought fit to express their "gratitude, admiration, and affection" by a *Festschrift* on the German pattern, published by Houghton, Mifflin & Co., entitled "Studies in Philosophy and Psychology," and dedicated to Professor Garman, whose portrait forms its frontispiece. The thirteen essays which the volume contains are of first-rate importance, but too various, and in some cases too technical, to call for detailed notice here—the philosophical periodicals will doubtless do them justice. Meanwhile the editors have printed, as a sort of introduction, "without the knowledge of Professor Garman," a long letter, written by him many years ago, in which his views of the way to teach philosophy and of its rôle in manly education, are vividly expounded. The philosophic class-room is for him the place *par excellence* in which a young man may acquire confidence in his own reflective judgments. He thinks that the crisis of intellectual self-reliance in the individual may, with proper pedagogic skill, be brought on there, and may make him immune for life against weakminded imitateness. As in the breaking of a colt, there is one grand opportunity, which bad teaching may forfeit, but which good teaching will secure, and protectively vaccinate, as it were, the student's future mental character. Professor Garman's own account of his methods is delightfully original. The whole volume, full as it is of able and striking matter, should suffice to show that a life modestly consecrated to what nowadays seems the less fashionable half of a "professor's" functions, may yet reap its meed of fame, and burst, in spite of itself, into the wider publicity. It should serve as encouragement to the pure teacher the world over.

Berlin newspapers contain warnings against a literary thief, Erich R. Salbey, a young man from Erfurt, who calls himself an author, but seems so far to have signed his name only to other people's work. One of his latest victims is a Viennese writer, two of whose book reviews Salbey published over his own name. When accused Salbey at first denied the charge and abused the accuser, only subsequently to admit his theft. He has also been exposed by Erfurt newspapers, and it is expected that his name will now disappear from Kürschner's "Literaturkalendar," in which it should never have appeared.

The Mohammedan College at Aligarh is one of the most interesting educational institutions in India, not only on account of its marked success, but because it is an unmistakable indication that the Indian

Mohammedans are awakening to a realization of their position and responsibilities. Founded in 1875 by a great reformer who, convinced of the evils attendant on a purely secular education, determined to unite religious instruction based on Islamic tenets with the secular learning of the West, it has 700 students from all parts of India, Burma, and Persia. An extensive area is covered by the college buildings, consisting of quadrangles of students' rooms, a mosque, central hall, museum and library, as well as a field for athletic sports. The rooms are divided into blocks, each under the care of a proctor. To develop the higher nature three student societies have been formed. The *Anjuman ul Farz*, or Duty, is to assist poor students, mainly by collecting funds to establish scholarships. The Brotherhood of Purity has for its aim the encouragement of manly morality. Last but not least is the debating and literary society, in whose clubhouse the best English periodicals are eagerly read. The way in which the Mohammedans are regarding it may be seen from what a leading Indian notable, the Aga Khan of Bombay, said of it in a recent address: "We want Aligarh to be such a home of learning as to command the same respect of scholars as Berlin or Oxford, Leipzig or Paris. And we want those branches of Moslem learning which are too fast passing into decay to be added by Moslem scholars to the stock of the world's knowledge. And above all, we want to create for our people an intellectual and moral capital; a city which shall be the home of elevated ideas and pure ideals; a centre from which light and guidance shall be diffused among the Moslems of India, Aye, and out of India too, and which shall hold up to the world a noble standard of the justice and virtue and purity of our beloved faith."

The practice and even the methods of latter day political criticism—muckraking, the unwise it call—are by no means new, as is attested in that journalistic miscellany "The Olivia Letters" (Neale Publishing Co., \$2). Writing in the winter of 1867 from Washington, Mrs. Emily Edson Briggs describes the descent of that grave historian, James Parton, upon the capitoline lobby. "James Parton, the distinguished magazine writer," she learns, "has been here for several days." He had been seen on the floor of the House, and also in consultation with many leading members of Congress; but anticipating the late Senator Gorman's tribute to the calling of Congressional page, Mr. Parton had also consorted with doorkeepers, messengers, pages, and all others who are supposed to be wise and serious when talked to in regard to "a certain very delicate subject." The cause of the inquiry was "that Mr. Parton is preparing an article on the Washington lobby." This monster of truly hideous mien "Olivia" proceeds to characterize in terms which suggest that the Octopus metaphor, too, is of a most respectable antiquity. She rejoices that Mr. Parton "is going to hold up the monster in the broad light of day—this creeping, crawling thing, which, in more respects than one, bears a strong resemblance to Victor Hugo's devil fish." The curious may still read Parton's exposure of the lobby in "Topics of the Times," where it stands as

a reminder to our more vociferous censors that the public interests may be subserved with a very moderate expenditure of ink and a merely gentlemanly supply of denunciatory rhetoric.

The Celtic revival has been rather less active in Scotland than in the other Celtic-speaking lands, but it appears to have borne fruit there in the increased study of place-names and local traditions. A good deal of material on Scottish Gaelic nomenclature has been brought together in recent years. Besides a number of articles in the Transactions of the Gaelic Society of Inverness and in other periodicals, we recall a book by W. J. N. Liddall, on the names in Fife and Kinross (1896), one by J. M. MacKinlay on the influence of the pre-Reformation church on Scottish place-names (1904), and another in the same year by W. J. Watson, on the names in Ross and Cromarty. G. F. Black of New York has printed in the *Caledonian* short specimens from an extensive collection of material which we believe it is his intention to publish. And now we have received from the firm of David Nutt in London a volume on the place-names of Argyll by Dr. H. Cameron Gillies, known already as the author of a Gaelic grammar and of articles on Gaelic medical lore. The chief service of these investigations has been in ascertaining and making accessible the facts with regard to actual local usage. For in this matter the official surveys, with their half-anglicized spellings, give very untrustworthy indications. The information is obviously fundamental for all study of the etymology of the names, and Dr. Gillies has taken great pains to make his collections for Argyllshire accurate. In the examination of documentary evidence concerning the earlier forms of names he appears to have done less than Mr. Watson. Many doubtful names cannot be satisfactorily dealt with until such historical data have been generally collected, not only for Scotland, but also for Ireland, of which we understand that the Rev. Edmund Hogan of Dublin has in hand a great onomasticon. Dr. Gillies's discussions of etymologies are not always lucid in exposition, or, in our opinion, sound in method. We are a little puzzled by his statement (p. 23) that one of two explanations of a name is "possible," but that the other is "correct." And we cannot agree with all of his derivations. We do not believe, for example, that *machaire* and *oirthir* are compounds of *tir* (as stated on pp. xxiii. and 3), or that *aird* is cognate with the English "earth" (p. 2).

The first volume of A. H. Leahy's "Heroic Romances of Ireland" was recently reviewed at some length in these columns. The second volume, now in our hands, contains five stories of the type known as "cattle-spoils," which constituted a favorite class of sagas among the ancient Irish, and dealt with what was doubtless a common incident of their tribal life. The great legendary struggle between Ulster and Connaught turned upon a cattle raid, and the saga which narrates it, the principal tale of the oldest Irish cycle, is entitled "The Cattle-Spoil of Cooley" (*Táin Bó Cúailnge*). With this great *Táin* there came to be associated a number of introductory tales (*remscéla*), some of them having little or no connection with the central story, and

it is five of these lesser tales of cattle-spoil which Mr. Leahy has translated. They are all, in different ways, good examples of the best period of Irish saga-writing. Mr. Leahy's method in translation differs from that employed in the first volume, where he rendered the Irish prose by prose and used verse for the metrical passages only. In the present case he has made a verse translation throughout, although the originals are almost wholly in prose, and he has supplied a literal prose rendering on the opposite page. We prefer his first method, for we are still doubtful about the value of his metrical versions. His verse, while acceptable enough in an attempt to reproduce for English readers the *cante-fable* structure of the original, has no particular charm or power, and a somewhat diffuse metrical paraphrase does less justice, in our opinion, to the Irish than a close translation in idiomatic English prose. Unfortunately, the prose which accompanies the verse in the present volume is, doubtless intentionally, so literal that it sometimes ceases to be English at all. Take a sentence like the following, which we quote from page 6: "Fifty sons of kings, this was the number of his household, co-aged, co-similar to him all between form and instruction." A few pages of this to show the peculiarities of Irish style and syntax—as in the case of the interlinear translation in Mr. Leahy's Appendix—may well be of service, but a volume of it seems to us hardly worth while. In spite of the criticisms we have felt bound to make upon both Mr. Leahy's volumes, we can commend them to English readers desirous of getting at the substance of some of the most interesting productions in Irish literature, and we believe they will help make the real nature of that literature better understood.

Under the general title "The Church Universal," a company of Anglican scholars propose to issue a series of eight small volumes dealing with the history of the Christian Church from the beginning to the present day. The volume now appearing is "The Church and the Barbarians; Being an Outline of the History of the Church from A. D. 461 to A. D. 1003," by the editor of the series, the Rev. William Holden Hutton, B. D. (The Macmillan Co., \$1.) To include the recital of the fortunes of Christianity, both East and West, political and doctrinal, during five and a half centuries, within two hundred pages, means altogether too great condensation. Mr. Hutton is overwhelmed by the multiplicity of his facts, and one feels in reading his pages that one is examining a skeleton, not following the development of an organism. The ecclesiastical bias of the writer is somewhat too evident. No opportunity to prove that the Church is "a divine institution with a continuous life" is neglected. The author is fully persuaded that the great Councils simply defined the faith which was delivered to the saints, and that if they had failed to define it just as they did—one person, two natures, two wills—"it would have been dissolved little by little by sentimental concessions and shallow inconsistencies of interpretation." Church history of this sort certainly will not unsettle any one's faith, nor will it con-

vey a real appreciation of the struggles through which Christian doctrine came to be.

The latest volume to be issued by the Royal Historical Society is "State Trials of the Reign of Edward the First" (London: Royal Historical Society, Chancery Lane). The editors, Prof. T. F. Tout and Miss Hilda Johnstone, have made use of "two plea rolls preserved in the Public Record Office, containing the official proceedings of the trials of the judges and other royal officers, before a special commission appointed by Edward I. in 1289." This trial of the judges for breach of trust and general perversion of justice is a dramatic incident in the legal history of mediæval England. For more than three years prior to August, 1289, the King had been in Gascony. On his return he found the land filled with protests against those who had represented the Crown during his absence. Determined to find out whether the royal confidence had been abused, Edward appointed Burnell, his trusty chancellor, John de Pontoise, Bishop of Winchester, Henry Lacy, Earl of Lincoln, and four other men of irreproachable loyalty, a commission to take evidence. Thomas de Weyland, chief justice of common pleas; Ralph de Hengham, chief justice of King's bench; Adam de Stratton, a leading official of the Exchequer; William de Brompton, a judge of common pleas; Solomon de Rochester, a justice on eyre; William de Saham, a judge of King's bench; Henry de Bray, justice of the Jews, and several lesser personages were disgraced. There can be little doubt that the King was actuated to make the inquiry by just motives, but the size of the fines and the willingness of the Crown to accept satisfaction through payment of money, would indicate a desire to kill two birds with one stone. The episode is more striking than the documents which contain the official records. Prof. Tout, with truth, calls them dull, and there are also large gaps. The chronicles of the period—Hemingburgh, the "Flores Historiarum," and the "Annals of Dunstable"—refer with their usual exaggeration to the iniquities of the judges; but, as Miss Johnstone points out: "The record is almost as disappointing as the chronicles. . . . In no less than 60 out of the 165 cases recorded in the shorter roll, the accusation is never given, or only vaguely given as 'trespass.'" There is, however, evidence that some, at least, of the judges used personal intimidation, besides giving open aid to friends through counsel and advice. By far the liveliest document in the volume is the "Narratio de Passione Justiciariorum," a satire written by some unknown clerk. The work of editing has been performed by Professor Tout and Miss Johnstone with care and erudition.

The second part of M. René Dussaud's "Notes de Mythologie Syrienne" (Paris: Leroux, 1905) comprises two-thirds of the entire 183 pages, exclusive of the index. Of the nine chapters in this *livraison*, eight appeared originally as articles in the *Revue Archéologique*, *Revue Numismatique*, etc. The first *livraison* contained but one chapter, dealing with the symbols and images of the Syrian sun-god. The principal chapter in the second part deals with the symbols and images of the goddess consort.

M. Dussaud concludes that Hadad, with his consort, Atargatis, and their child or children, Simios and Simia, came from Babylon, gained a footing at Hierapolis, and spread thence over Syria, Palestine, and Phœnicia. In Syria proper, as at Damascus, for example, the local divinities were completely assimilated with these gods. In the Roman period we have a new diffusion of Hadad and his consort, superimposed on the first, under the secondary form of the Heliopolitan Jupiter (p. 115). In a chapter on the Phœnician Pantheon M. Dussaud undertakes to show, with a considerable degree of success, that the fragments of a Phœnician cosmogony preserved by Eusebius from a translation, by Philo of Byblos, of the work of the priest Sanchoniathon, possess little or no value as a record of genuine ancient Phœnician myths and legends. The Phœnician Pantheon was practically the same everywhere: at the head a solar divinity, the master, or *ba'al*, of the town and its founder, and along with him the goddess Asartate. There was also a second group, apparently of agrarian origin, Sadyk and his son Eshmun-Adonis. M. Dussaud presents the Aramæan and Phœnician mythology, particularly as it shows itself in the later period, the Greek and the Græco-Roman. All his illustrations are drawn from coins and monuments of that period, and represent rather that official mythology, which was a hybrid of West and East, than the native and original religion. It is curious that M. Dussaud, who is generally so keen to detect and disclose traditional errors, should himself have perpetuated such an error. In the chapter on Dusares, he has much to say of *betylia*, a word which he uses to indicate any sacred stone or pillar. From neither Greek nor Semitic antiquity (*cf.* Prof. George F. Moore, in *American Journal of Archaeology*, vol. vii., No. 1), can such a use be justified. The *baitulos* or *betylion* is a small stone, supposed to have fallen from heaven, to be endowed with motion and speech, and to give oracular responses. It has nothing whatever to do with the stones or stone pillars, set up by the Western Semitic peoples, which they anointed, worshipped, and kissed, and at which they offered sacrifices. The story of Jacob's pillar, and the similarity of Bethel to *baitulos*, led to the confusion of the two words and their different ideas. This misuse of *baitulos* or *betylion* can be traced back only as far as the seventeenth century.

Harrison Grey Fiske has returned to this city to superintend preparations for the production of "The Kreutzer Sonata," adapted by Langdon Mitchell from the Yiddish of Jacob Gordin. The part of the heroine is to be played by Bertha Kalich.

Gen. Patrick Maxwell, who died recently at Bath, England, in the eightieth year of his age, was an Indian officer, who served brilliantly in both civil and military capacities—and was famous as a linguist. He was the author of admirable metrical translations of Schiller's "Maid of Orleans" and "William Tell" and Lessing's "Nathan the Wise," and made a prose translation of Lessing's "Minna von Barnhelm." His version of the remarkable drama of "Nathan the Wise" has been

highly commended both by English and German critics; among the former by Sir Theodore Martin, who congratulated him "on having given to English literature as adequate an interpretation of that noble work as could be desired."

The proclamation on behalf of Mr. Arnold Daly, that, notwithstanding the court decision in his favor, he will neither produce "Mrs. Warren's Profession" himself, nor permit any one else to do so, betokens prudence and a tardy appreciation of the best public sentiment. Possibly a higher tribunal might entertain different views as to the general effect of Mr. Shaw's didactic vulgarities upon public morals. Mr. Daly is said to entertain the conviction that there is a fortune in the piece for any one producing it. He would probably find out his mistake if he made the venture. As a matter of fact, there is not much to be said against the thing on the score of immorality. If anybody but Mr. Shaw had been the author, it might have been possible to argue that it was written with a genuine though desperately mistaken moral purpose. But the discussion would be exceedingly tiresome and unprofitable. The play is unfit for the stage because it is offensive, because, under the pretence of startling and salutary exposure, it grossly exaggerates perfectly familiar evils in a fashion that may gratify the coarsest taste, but is powerless for good; because it applies to modern comedy the methods of an ancient, outworn, and clumsy melodrama; because it is devoid of artistic restraint, truth, or sincerity; because, in spite of all its verbal cleverness, it is platitudinous, coarse, and obnoxious.

The dramatic critic of the *London World*, H. Hamilton Fyfe, in briefly reviewing the past London theatrical season, says: "The public is not, by any means, without intelligence. It goes to musical comedies because it must go somewhere, and because the managers who go in for this form of variety entertainment take pains to give playgoers an article worth their money. But if an equal number of managers took equal pains and spent an equal amount upon providing good plays, the public would, undoubtedly, transfer its custom. We should soon see the musical comedy mongers hitting the workhouse, as the American journals put it. Here, then, is the reason why so few good plays are produced. It is because the management of theatres is chiefly in the hands of people who neither care for good plays nor would be capable of running theatres which made a specialty of producing them. It is nonsense to say they would provide more intelligent dramatic fare if there was a demand for it. Very wisely they kept to the only kind of thing which they like, and in which they can profitably traffic. It would be as grossly unjust to blame them as it is to cast the discredit of our decadent stage upon the public. Good things never come in answer to a demand. They are forced upon the world from above. If we had a few managers resolved to make the theatre a living force in our national life, we should notice a change very soon." This is the plain truth. The public has no means of making any demand upon the manager. It can take what is offered or go without. In-

variably it selects what is good of its kind, making the best of a bad bargain.

"DADDY" CRISP.

Burford Papers. Being Letters of Samuel Crisp to his Sister at Burford; and Other Studies of a Century (1745-1845). By William Holden Hutton, D.D. New York: E. P. Dutton & Co.

Mr. Hutton's latest book, "Burford Papers," is a hybrid work in which some family letters of the eighteenth century form a prelude to numerous short essays on the period, 1745-1845. The essays are by Mr. Hutton, who also furnishes in a few local sketches the background. The letters themselves are a fragment of the correspondence between Samuel Crisp, the author of "Virginia," and his sister, Mrs. Gast. The title, too, requires a word of explanation. For most Americans the chief association of Burford is with a little village nestling under the western edge of Boxhill. Here in the inn whose French windows open on slopes of green velvet, Keats wrote "Endymion," while the whole neighborhood is redolent with the memory of William Blake, Disraeli, George Meredith, and other literary celebrities. But not amid the highlands of Surrey is Mr. Hutton's Burford. In Oxfordshire, as every one will remember who knows his Clarendon and his Matthew Arnold, there is another Burford—the Burford of Burford Priory, where once lived Lucius Cary, Lord Falkland, the apostle of "sweetness and light" in a generation which otherwise was disturbed by the fierce strifes of Pym and Strafford, Nehemiah Wallington, and Sir Nicholas Crisp. William Lenthall, Speaker of the Long Parliament, bought Burford Priory from Falkland, and since that time the place has had no remarkable renown. But near at hand is the town of Burford, whose beautiful parish church is the chief architectural glory of the Cotswolds. And since in England past and present are closely woven to form the same rich web, with Burford Church is connected the name of William Morris. Just thirty years ago he happened to be at Burford for part of a day when the church was "undergoing restoration." Scandalized, he sat down at once to propose the formation of a society "which might deal with such cases, and, if the destruction done by the restorers could not be stopped, might at all events make it clear that it was destruction and not preservation." So much for Burford in general. The application of this place-name to the present volume has been explained by Mr. Hutton in the first sentence of the preface: "Such unity as these 'Studies of a Century' possess is due to all of them, I believe, having been written either to or at a house at Burford in Oxfordshire." The residence referred to is the "Great House" where Mrs. Gast was living when she received the letters of her brother, Samuel Crisp, and where Mr. Hutton himself seems to be living now when not engaged in tutorial duties at St. John's College, Oxford.

Samuel Crisp, who is the most prominent of Mr. Hutton's eighteenth century figures, is not quite forgotten by the present generation. Dr. Birkbeck Hill knew all about him, as he did about every acquaintance of

Dr. Johnson; and those who are curious about the family affairs of Fanny Burney have often come upon his name. For the rest, Mr. Hutton compresses what is essential into two sentences:

Samuel Crisp was a man of letters and fashion, who, in 1754, produced at Drury Lane his tragedy of "Virginia," when Garrick himself played Virginius and Mrs. Cibber Virginia. That, for the world, was his title to fame, for the play, if it was not a first-rate success, was much talked of, and was published in the same year by Tonson. Descended from Sir Nicholas Crisp, who is alleged to have spent £100,000 on behalf of Charles I, the author of "Virginia" had good social connections, and either at Chessington or London lived a peaceful, interested existence upon the fringe of the literary and fashionable world. His letters to Mrs. Gast, however, do not convey much gossip regarding either movements of thought or the personal habits of wits and authors. Those which are here published were written when he was an elderly invalid, a little nervous about his investments.

The one friendship of interest which stands out in Mr. Crisp's epistles is that with Dr. Burney and his daughter. The Thrales, Dr. Johnson, Sheridan, and other celebrated persons, come in at intervals, but, save for the Thrales, without leaving a very distinct impression of Mr. Crisp's attitude towards them. We have noticed no more brilliant incident than a dinner at the Thrales', which seems to have been on a plane with the host's wealth.

I met a vast deal of company at Streat-ham, where everything was most splendid and magnificent—two courses of twenty-one dishes each, besides Removes; and after that a dessert of a piece with the Dinner—Pines and Fruits of all Sorts, Ices, Creams, &c., &c., without end—everything in plate, of which such a profusion, and such a Side Board: I never saw such at any Nobleman's. A most Gracious Reception, and such pressing invitations to stay as I could hardly escape; but I got away, and reach'd home by 9 o'clock, and glad I was to creep again into my own Nest."

A passage of somewhat greater intrinsic interest (p. 72) relates to the effect produced by Cornwallis's surrender at Yorktown, upon the mind of a small investor who is afraid of losing his principal. To compare small people with great, it recalls Darwin's fear lest the discovery of gold in Australia should be the ruin of his children by lowering the value of his investments. "At present," says Mr. Crisp, writing on December 29, 1781, "the prospect is dreadful. . . . In times of such horrible Danger hardly anything but hard Gold seems secure, and the growing Interest seems scarcely an Equivalent for the Risk of the Principal."

If Mr. Crisp may be called a star of small magnitude, his sister Mrs. Gast is hardly more than a speck in the Milky Way. She was good to the poor, disliked Non-conformity, was a friend of Molly Lenthall at Burford Priory, and was praised by the local newspaper in an epitaph which, from its length, could not have been put upon any ordinary tombstone. Miss Austen might have found material for a character in Mrs. Gast, but untouched by the spell of another's genius, she seems a commonplace person. For biographical zealots, she enjoys the advantage of having flourished in the eighteenth century and corresponded with the author of "Evelina." Samuel

Crisp, by the way, thought that the emoluments drawn by Miss Burney from literature came very easily. Apropos of the sum paid for "Cecilia," he writes: "A pretty Spill (£300), for a young girl in a few months to get by sitting still in her Chamber by a good Fire!"

Mr. Hutton's essays are much better reading than Mr. Crisp's letters, and deserve well at the hands of all who love the eighteenth century. In one of them it is pointed out that the Oxford don of the present day knows much more about foreign literature than was known by his predecessor of a hundred years ago. Incidentally, Mr. Hutton's own essays bear out this statement. They draw inspiration from many sources, and though written by a clergyman of the High Church party, are informed with a cosmopolitan spirit. Whether the subject be Raphael Mengs, the Stuarts in Exile, the life of Bath, or the minor poets of the eighteenth century, there is always an adequate fund of information. That the touch is not heavy may be seen from a single characteristic sentence, which occurs in one of the papers on Bath: "Here Wesley preached, and Burke meditated, and Anstey satirized, and every person we have ever heard of—except Hannah More—gambled."

On the whole, the best section in this diversified volume is a group of eight studies "On the Religion of a Century." We have styled Mr. Hutton a High Churchman, and he is not unwilling to amuse himself at the expense of Wbig ecclesiastics, like Bishop Watson of Llandaff and Sydney Smith. But his prepossessions do not make him disagreeable, while at times they add spice to his criticism of latitudinarians. His feeling for John Wesley is sympathy and admiration, heightened perhaps a little by the circumstance that the great evangelist looked upon himself to the last as a member of the Church of England.

RECENT GERMAN FICTION.

A distinct reaction against morbid tendencies may be observed in much of the recent German fiction. Kurt Martens, the author of the "Roman aus der Dekadenz," and other stories which ranked him with the best novelists of the modern school, has just published a new book which deserves some notice. "Kreistauf der Liebe" (Egon Fleischel & Co., Berlin) has for sub-title "the story of the better man," and is a charming piece of still life, with just enough of narrative in it to keep up a steady interest. The local background is provincial, the intimate *milieu* of the hero being a quiet bachelor home, regulated as much by the set official duties of the "Herr Assessor" as by the pedantry native to him. Yet there is a flavor of idealism throughout, and there are passages of a delightful humor. The opening scene is unique—with the sonorous bass of the Herr Assessor dramatically declaiming in his office a love poem which has just come from his pen, while the complainants, defendants, and witnesses are waiting for him in the corridor of the court building, and the officers on duty whisper to each other, "the Herr Assessor is writing poetry." The character of the dear old-fashioned Assessor Nothaas stands out against this background in

strong, clear lines. It is plain from the outset that he is not a match for his friend Karstens, the artist, with the traditional egotism and Bohemianism of genius. As a whole the story is a great relief after the pictures of morbid psychology in which Martens formerly indulged.

The reaction is even more distinctly emphasized in a story by Georg von Ompteda, "Normalmenschen," published by the same house. Obeying the voice of duty, the hero, a lieutenant in the army, so normal as to be almost commonplace, renounces an innocent love affair with a girl of humble birth and slender purse, and in the hope of advancement marries a girl of wealth and connections. But his abilities are in no way remarkable, and he is not promoted. The simple, straightforward and unadorned way in which the author tells this story has an indefinable charm. Ompteda is a master in the portrayal of German military types, of the impoverished nobility, and of the unmarried middle-class woman. His style is clear and easy.

Quite another spirit reigns in "Ingeborg," by Bernhard Kellermann (S. Fischer, Berlin), whose previous work, "Yester und Li," challenged attention and caused him to be looked upon as a writer henceforth to be reckoned with. This is a story of sentiment and passion in so fanciful a setting, as to call forth the question, whether it is not a romance of some remote period. There is no breath in it of the workaday world, but a holiday spirit, and an air almost of sanctity. The hero is all purity, justice, and love. The woman is a more tangible creature, a child of nature, a woodman's daughter with the voice and the artistic instincts of her dead mother. Of course there is a third, their friend, a poet, who leaves when he sees danger of disturbing the idyl. Yet the end comes, without bitterness, without jealousy, without a dramatic climax. The tragedy is not in what is done, but in what is felt. The book is a record of intense emotions, of genuine sentiments, but not of nervousness. It is fanciful, perhaps extravagant, but it is sound throughout. There is for the most part a real charm in the author's language, although he sometimes lapses into the *staccato* movement of the modern school.

"Schwuele Tage," by E. von Keyserling (S. Fischer, Berlin), is a volume of three remarkable short stories, amply justifying the title Sultry Days. "The first story 'Harmonie,'" is one of nerves. There are the healthy nerves of the hero, who would enjoy nothing better than a little work in the fields on his own estate; but such work is distasteful to his wife, who has the diseased nerves of her maternal ancestors. The return of the husband to his home, only to find that his wife's ailment has estranged them, is a fine bit of dramatic impressionism. There is grim humor in the description of the family dinners which pass off like important social functions. There is even a suggestion of satire, when the convalescent outlines the programme for the evening: crab soup, snipes, *pain d'ananas*, champagne, twilight in the blue room and the nightingale. Primitive instincts and primitive customs are the burden of the second story, "Die

Soldatenkersta," which depicts humorously one phase of recruit life. The book receives its title from the third story, which like the first begins with a return. A college boy, who has failed in examinations, is forced to spend the summer alone with his father in the large manor house, while mother and sisters are away on their vacation. Father and son had always stood aloof from each other. Now the boy begins to study his progenitor, and in doing so picks up the threads of a romance which links his young cousin to the elderly man. The psychology is subtle, and reminds one of the manner of our Henry James, who as yet has not been discovered in Germany.

Gerhard Ouckama Knoop is a writer of some originality, but there is an irritating diffuseness about his work. "Nedeshda Bachini" (Egon Fleischel & Co., Berlin) is the story of a woman's quest for love, a grotesque Odyssey of errors. Madame is a widow of rather incongruous international descent, her views are broad, and she encounters many adventures, some serious, others humorous, which she duly confesses to a faithful trio of brotherly friends.

A number of books which seem to be the direct products of a Rosegger school have recently appeared. One of these is Max Geissler's "Huetten im Hochland" (L. Staackmann, Leipzig), a splendid story of mountaineer life, near the Bavarian border. Simple life and simple manners—there is nothing complicated about the characters or the plot. The fate of these people runs its straight and plain course, logical as the operation of nature's forces. With their strong untutored instincts they work out their own destiny, be it good or evil. A unique situation is presented in the chapter where Wenz am Kreuz meets the woman who had jilted him to marry another. The hour in which she refused him he had stopped his old clock and never wound it since. Now that she is a widow her matter-of-fact nature sees nothing wrong in openly courting him. But he is of a more delicate fibre and her advances kill the sentiment he has been cherishing for years. There are other interesting glimpses of simple soul life, as for instance the gradual blunting of the moral sense in a child not naturally a criminal. The nature scenes are almost equal to Rosegger's. The stillness and the solitude of this snowbound world are admirably suggested.

The same firm has published a new volume of stories by Rosegger himself, "Wildlinge," which are full of the charm that has endeared the author to readers all over the world. It is the charm of simplicity and sincerity. Rosegger is to-day what he has been from the beginning: a woodland bird singing on in his untutored way and defying the subtle analysis of scholarly critics. So he describes himself in the preface to the new book: "If even to-day I am fond of calling myself the *Waldbauerbub*, it is only to call attention once more to the standard which is to be applied to my work; æsthetically a low one, ethically a high one." So the author, himself, a "wildling"—why not use a direct transcription of the word he has coined?—tells in this volume some stories of his own crude youth, with many a reminis-

cence of scenes and characters long treasured in his memory. Nature finds in him an interpreter of almost solemn seriousness. It is sacred to him, for he sees in it the work of the Creator. "Ein Lied von ewigen Dingen," is indeed a song of things eternal. Others are remarkable for their humor, as the story of Naz, the country tailor, whose apprentice the author had been in his boyhood; and the story of the vagabond known as the *Waldteufel*.

THE INFLUENCE OF WESTERN EUROPE ON SCANDINAVIAN CIVILIZATION.

On the Fomorians and the Norsemen. By Duaid Mac Fírbis. The original Irish text, edited, with translation and notes, by Alexander Bugge. Christiania.

Cathreim Cellachain Caisil: The Victorious Career of Cellachan of Cashel. The original Irish text, edited, with translation and notes, by Alexander Bugge. Christiania.

Vesterlandenes Indflydelse paa Nordboernes ydre Kultur, Levesæt og Samhundsforhold i Vikingetiden. Af Alexander Bugge, Christiania.

Vikingerne: Billeder fra vore Forfædres Liv. I. and II. Af Alexander Bugge. Christiania.

The influence of Christian, and particularly Irish, civilization on the Scandinavian nations during the Viking age has long been a recognized fact, and much valuable work in establishing the extent of this influence has been done by earlier Scandinavian historians, such as the Norwegian P. A. Munch, who, with his wide learning and constructive genius, had a clearer insight into this difficult question than many of his juniors; and the Dane, Steenstrup, who, in his epoch-making work on the "Normans," has thrown a flood of light on the early relations of the Scandinavians with Celts, Franks, and Anglo-Saxons. Yet it was left to the youthful author of the works mentioned at the head of this article to go straight to the fountain-spring, and, by a thorough study of the old Irish language and early Irish texts, to gain the knowledge necessary for an intelligent grasp of the subject.

The first two works named above are editions of Irish historical texts, which, on account of their bearing on Norwegian history, the editor has chosen to render accessible to a larger public by attaching an English translation, together with copious notes. The publication is at the expense of the Norwegian Government. The last work in the list is a popular presentation, in two volumes, of the author's views and conclusions. Written as they are in an easy and interesting vein, these essays describe the social and political evolution of Scandinavia in a period which has not before been treated in a way at once scientific and popular. Several of them, indeed, touching important phases of early English history, deserve translation into English.

After the return of Fridtjof Nansen from his polar expedition there was subscribed in Norway "The Fridtjof Nansen Fund for the Promotion of Science," which offered its first prize for a work upon the influence of western Europe on early Scandinavian, particularly Norwegian, civilization. This

induced the composition of the third work under review. The author is the son of the philologist, Prof. Sophus Bugge, and is himself a professor of history in the University of Christiania, having succeeded to the chair left vacant by the death of Prof. Gustav Storm. In about 400 octavo pages he examines the influence of western European civilization during the Viking Period on public administration (the royal power) in Norway, as well as, less exhaustively, in Sweden and Denmark, on dress, ornamentation and furniture, on commerce, ships and shipbuilding, as well as on the art of war, agriculture and cattle-raising, coinage, and pictorial art. A final chapter treats the Norwegian colonies in Iceland and the Faroe Islands, and the influence of Irish and Anglo-Saxon civilization.

Professor Bugge shows that Harold the Fairhaired, in establishing a centralized royal power in united Norway, was guided by the example of Charlemagne and his successors as well as by that of the Anglo-Saxon kings; and that this foreign influence exerted itself not only on the political but also on the social arrangement of his administration and his court. Thus, his surrounding himself with a number of court skalds, or poets laureate, was in all probability due to Irish court customs, with which he and Norwegians generally must have been familiar through the connection between the people at home and the Norwegian kingdom in Dublin, then established for more than a generation, and ruled over by kings closely related to Harold himself. In many respects we are compelled to modify our former opinion of the Vikings as pirates and outlaws, a scourge to the countries visited by them. They came to western Europe not solely on warfare bent, but more often as merchants, bringing the goods of southern and western Europe to the shores of the Baltic and the trading-places of Russia, and again bearing staples of the Orient to western Europe. Norsemen taught other European nations the art of sailing the open sea without putting into port over night, as had been the custom heretofore. Although the Vikings were good fighters, they had much to learn in scientific warfare from the nations whose lands and cities they devastated; the employment of cavalry, in particular, they borrowed from their adversaries. In the same way they borrowed not only the art of fortifying cities—an art which the Norsemen in their turn introduced into Ireland—but also that of besieging and assaulting fortified cities scientifically.

Coinage was unknown in Scandinavia before the Viking period, the imitations of Roman and other coins which were previously produced having served merely as ornaments, not as a circulating medium. The first money coined by a Scandinavian seems to have been that bearing the stamp of the Danish sea-king Halfdan, one of Lodbrok's sons, coined during his sojourn with the great Viking army at London (871-872); but apparently the mint masters were Frankish rather than Anglo-Saxon.

Coming to ornament, particularly on the runic stones, of which many have been preserved, chiefly in Sweden, it appears that these stones present striking similarities to Christian stone monuments in England,

and above all in the Isle of Man, which was conquered by the Norsemen, and where traces of Norwegian language and institutions are still found. This artistic influence may have exerted itself through peaceful trade connections which existed from a very early period between the Swedish town Birka (now Björkö in the Mälars Lake) via Gotland, on one side, and English and Frisian cities (especially Dorestad, whose coins are found in great numbers in Gotland and on the mainland of Sweden) on the other.

Taken as a whole, the works here briefly reviewed bear eloquent testimony to the learning, industry, and talent of the young author, *filiius præclaro patre dignus*.

OSCAR WILDE.

The Life of Oscar Wilde. By R. H. Sherard. London: T. Werner Laurie; New York: Mitchell Kennerley.

Whether there is any *raison d'être* or not for a life of Oscar Wilde, the writing of such a biography is, at all events, attended with unusual difficulty. What can be told about the man, is already pretty well known, and there is little enough of it at best; whereas what is generally unknown, cannot be told at all. The result is that such a biography, as far as it is not impertinent, must be either a rather vague and unsubstantial apology, or else a bold and dashing denunciation. Of these alternatives, Mr. Sherard has chosen the former, and under the circumstances the choice is rather unfortunate. Not that Mr. Sherard is a partisan exactly; he is disposed to be fair and judicial. But as there is so much, in the nature of the case, to be suppressed, so much, too, which can be only alluded to, his book has a decided air of whitewashing. Nor is the effect entirely the fault of the subject and the circumstances. Mr. Sherard's tones are not quite clear; his moral philosophy is not quite robust and direct enough for the terrible problem of human responsibility and error with which he has to deal; while he is still further confused by the distracting hubbub of creed and opinion which constantly dins the ears of the modern critic. As an apologist he is always in a frightful dilemma. He has to save his author's wits at the expense of his character, or his character at the expense of his wits. So, for example, he represents Oscar Wilde the aesthete as no such fool as he seemed, but as merely posing for notoriety, playing "a double-faced rôle" for the sake of the advertising he might get out of it:

He knew . . . little about painting, and in the matter of furniture, tapestries, wall papers, and architecture he was no more of a *connoisseur* than is any man who assimilates the current modes and the chatter of the arbiters. It is a fact that music bored him; it is a fact that he had no knowledge of any instrument; it is probable that he could with difficulty distinguish one tune from another. Yet he was forced to pose as a *connoisseur*, and to speak and write about musicians and music with the air of one who was profoundly versed in all the technicalities of the art.

While on the other hand he seeks to excuse the errors of later life by a "psychopathia" analogous to that of the drunk-

ard who is unconscious and irresponsible with regard to his worst acts:

After each crisis Oscar Wilde seems to have been totally unconscious of having done anything bad, detestable, shameful, or even unusual. Under no other condition could he have maintained the serene and tranquil dignity which stamped him in his sane moments. . . . Such consummate dissimulation, where it is not hypocrisy—and Oscar Wilde was no hypocrite, could not be a hypocrite, was too arrogant to be a hypocrite—is invariably the concomitant of the worst forms of madness.

And this of the man who has been represented as a master of duplicity, playing his part for an easy celebrity!

But the moral confusion and obliquity are increased by the writer's scientific pretensions. "It is such a pity," he complains in the midst of this very passage just quoted, "that people, because they are still under the stupid domination of the Church, will not approach these matters in a purely scientific spirit." It does not seem to occur to him that it is for the specialist alone that "these matters" are properly scientific; for most of us they are still moral matters, after all. And it is for this reason that his explanation of Oscar Wilde's unpopularity with the respectable is so erroneous, scientific though it may be:

There is much of the moping owl in a large section of our stolid Britishry, and people of that category dislike nothing more intensely than the man of radio-activity who bustles into the stagnate area of their gelid dullness, and interferes with their somnolent eupepsia. To be forced to think, to be forced to laugh, to be taught things, in one word to be interfered with. No! No! No!

This may not be a favorable specimen of Mr. Sherard's science or of his English, but it is fairly illustrative of the insecurity of both; while as a consequence of all these causes of confusion he falls into a very unpleasant and misleading ambiguity of tone with respect to his subject in general. Oscar Wilde may have been a great talker; and, in default of any very large or solid literary residuum, it may be fair to argue that his reputation as a wit should rest mainly on that basis. But it is hardly decent, in such a connection, after remarking that "the greatest philosophers, the men who gave new religions to the world, did not write; they talked," to ask, "Did Christ write, did Mahound write, did Socrates write?" nor does it seem precisely in character to make the judgment of such a man a subject of unqualified pathos. At the same time, it should seem, there can be no doubt about Oscar Wilde's charm when at his best, no question about his unusual gifts—and the writer has done well to set them in a strong light. But with all that there is moral confusion enough in the world already without extending it to so plain a case.

The True Story of Paul Revere. By Charles Ferris Gettemy. Boston: Little, Brown & Co. \$1.50 net.

It is one thing to break an image—a highly popular image—and another to piece it together again in a half-relucting way, and set it up on a pedestal of one's own restoration. All this, and more, Mr. Gettemy has done, for the cracks and seams

exposed in the character of Paul Revere do but render this worthy man more appreciable, humanly and historically, while his legendary virtues sink advantageously away.

North End reared and taught, Revere was a seasoned Bostonian before the years of his true importance came to him on the threshold of middle life. He had by then followed his father's trade of gold and silver-smithing, served as a soldier, been bound over to keep the peace for assault and battery, dealt in artificial teeth, and displayed some proficiency in copper-engraving, which he used in caricature, supplementing his art with the least notable of his various achievements, patriotic verse. Dating from the Stamp Act period, Revere's training in Boston affairs for some years had been shaping him into a revolutionist of a distinct type. A Freemason, a Son of Liberty, with a relish for the mystery and excitement of secret meetings and town caucuses, he was so imbued with the spirit of American politics and its invariable demand for the *quid pro quo*, that we may allow ourselves to wonder to what heights he might have risen, or to what depths sunk, had it been Paul Revere's fate to live a hundred years later. As early as 1773 he was known in the doggerel of the hour as "bold Revere," and was ready, no doubt, in spite of the burden of a large family, for any venture which promised a risk. He began to carry messages from the Committees of Correspondence between Boston and New York, and even Philadelphia. "Steady, vigorous, sensible, and persevering," as Dr. Thomas Young called him, he did this work effectively and gained repute thereby.

Mr. Gettemy's interpretation of the Midnight Ride is not Mr. Longfellow's; but there is no destruction in his conclusion that Revere's ride of April 16, to inform Hancock and Adams that the British were planning an expedition, probably to seize the stores at Concord, vied in importance with that more famous enterprise of two nights later.

Left a widower with a well-filled quiver and soon remarried, Revere now began to make his service as a courier of patriotism profitable toward the support of his family; but, alas for the brightness of his laurels! his bills were not always audited for the amounts charged. The Massachusetts Council cut his account for riding from five to four shillings a day, and even shaved his bill for printing money for the army. Mr. Gettemy cites other instances where the Government held that this patriotism of many occupations was charging too high prices. Used to trading, it is probable that Revere regarded these financial criticisms as quite in the ordinary way of business, for there is no record of any protest against the economical moods of those who employed him; in fact, his true patriotism may have begun where his commercial spirit knew when it was best to stop.

Of the several adverse happenings in his career, the severest was the charge against him of disobedience and neglect during the Penobscot Expedition under General Lovell and Commodore Saltonstall—an expedition as inglorious as the march of the noble Duke of York. Inactivity and desertion

marked its short campaign. Persistently demanding a court-martial, Revere finally received this doubtful privilege, and was definitely if not triumphantly acquitted of the stigma of dishonorable conduct. Cowardice was so little in accord with his general character, that this verdict of a friendly court will probably satisfy the demands of historic scrutiny. As a soldier Revere made no mark; he was probably too pronounced a personality for customary discipline, though well fitted for adventure; his fame must rest on brilliant episodes.

The war over, Revere, failing to get the coveted reward of heroes—a public office—returned to the making of an honest livelihood. Mr. Gettemy says that Revere manufactured gunpowder during the Revolution. This is a mistake. He did, however, supervise the making of powder by one Evedon, and purchased it for the Government. From powder to the founding of cannon was not a long step, but it led to the establishment of a business substantial and creditable to the Revere family. Identified with all common interests of his day, with a fondness for civic prominence, it was natural for Paul Revere to shine in the ranks of freemasonry and to "belong" to various associations peculiar to the taste of the average citizen. He survived the War of 1812, during which he volunteered the service of his fourscore years to help throw up fortifications. He died a few years later, with blemishes forgotten, receiving honors according to his deserts. Mr. Gettemy's reserved but commendable study does not probe deep, but it is truthful and scrupulous in its intent. He has not, however, over-stated his indebtedness to E. H. Goss's previous work. A suitable index, attractive half-tones, and Stuart's portrait of his subject, add to the value of the present volume.

The Diary of William Bentley, D. D., Pastor of the East Church, Salem, Mass. Volume 1. April 1784—December, 1792. Salem: The Essex Institute.

William Bentley was a man well known and widely honored in his day. He died in 1819, in his sixty-first year, after a pastorate of thirty-six years, leaving a vast volume of manuscript remains, including sermons, letters, notes on natural history, meteorological observations, parish records, and his diary. A few sermons and addresses were published during his life, and selections from his historical notes have appeared in print from time to time. But his most important work, his diary, has remained in the archives of the American Antiquarian Society of Worcester. By the cooperation of this society and the Essex Institute of Salem, the first volume, covering a period of eight years, has now been published in a substantial octavo of five hundred pages. It is prefaced with a brief biographical sketch, prepared by the late Judge Joseph G. Waters, which recalls Dr. Bentley's extraordinary linguistic attainments, his love of scientific and historical pursuits, and the high esteem in which he was held by his own people, as well as by Presidents Adams and Jefferson, each of whom pressed him to accept high office. But the diary is better than any biography as a revealer of his true life.

A diary, to be sure, is a dangerous thing for the reputation of its writer, especially if he resolve, as Bentley did, to write something every day in the year; and it may be questioned if it is fair to proclaim upon the housetops what a man said to himself in the secret place of his diary. The excellent Nathaniel Rogers, minister of Ipswich, required of his executor that he should burn his diary, evidently fearing the posthumous revelation of his inmost life to a critical world. A deal of Dr. Bentley's had been more wisely burned than published. It is a vast conglomeration of very miscellaneous material. Much of it is of trifling significance, stories of excursions to neighboring towns, his fishing and bathing in the harbor, and commonplace annals of a quiet town. Much is gossipy and frivolous, tales of his tea-drinkings and his petty variance with his landlady and newsmongers. He had a passion for minutiae, and endless industry in recording names, figures, and facts. He thought highly of his own talents as poet, scholar, and critic at large, and his diary parades his deliverances as the obsequious Boswell recorded the sayings of the great Dr. Johnson. He had a pedantic way of narrating some of his commonplaces in Latin or French, strangely jumbled with snatches of poetry, sage moral reflections, and briefs of letters. As a literary composition, all this will prove a weariness of the flesh to the reader.

Nevertheless, this robust, Johnsesque parish minister is a very entertaining figure, a strong, kindly, though often sharp-tongued, man among men. He has preserved a vivid and valuable picture of the church life. With loving attention to the smallest detail, he wrote down the names of all the people of his parish and much of their history. Hot religious bickerings were the order of the day. Young Bentley was a warm advocate of the new Unitarian creed. Universalism and Methodism were rising up in sharp rivalry with the old Puritan faith. Anabaptists, New Lights, and "Hopkintonians" were asserting themselves. Apostles of the new order were abroad on itinerating tours. There were controversial disputes in the newspapers. The diary reveals its writer as fond of disputation, but his sharpness and rancor were probably typical of the spirit of the day. Jesse Lee, the famous Methodist, preached one evening in Salem. Bentley's verdict was, that he "so generally disgusted a large audience that he has finished his work in this town." In a newspaper article he replied to "the infamous Cleveland of Ipswich" (the Chebacco parish, now Essex), who had been calumniating the Universalists. "A more hardened wretch," he says, "scarcely ever appeared." The Anabaptists were upon the river in Beverly "immersing their disciples in water and ignorance." He rejoices in everything that is opposed to Calvinism and tends to shake "the abominable doctrine of the Trinity."

Bentley's chronicles of the town are of great interest. He went about the streets remarking on the houses and other buildings and investigating the sites of ancient homes. He frequented the shipyards and the wharves. Political affairs, too, interested him. He deplored the prevalence of lotteries, which were resorted to by the State and by towns in behalf of measures of public improvement.

When the small-pox epidemic appeared in 1792, he began at once careful observations of the value of the newly discovered inoculation. Taking large personal risks he visited hospitals, preached there on Sundays, and recorded full details of the progress of the disease. We admire this fine abandon of the man of gown and bands. We honor the scholastic spirit that led him to resolve "to insert a criticism of every work printed in America, within my knowledge, and as much of its American history as is convenient."

The genealogist will find much of value in the endless lists of names and vital statistics. The local antiquarian will welcome the topographical notes. A larger public will find beneath the pedantries, the trivialities, the jealousies, the strong life of an earnest, laborious, large-souled and sympathetic man.

Gothic Architecture in England: An Analysis of the Origin and Development of English Architecture from the Norman Conquest to the Dissolution of the Monasteries. By Francis Bond, M.A., Lincoln College, Oxford. With 1,254 illustrations, comprising 785 photographs, Sketches, and Measured Drawings, and 469 Plans, Sections, Diagrams, and Mouldings. Pp. xxii, 782. London: B. T. Batsford; New York: Charles Scribner's Sons. 1906. \$12 net.

This is a scholar's book. It is a very large octavo, having, besides the preface, a rather full introduction, a "Chronology of English Churches," twenty pages long, an index to illustrations, an index of places, and an "Index of Subject-matter and Glossary." Besides the illustrations in the body of the work there is a series of plates of spires, a series of plans of piers and sections through arches and ribs, similar sections through ground courses and "springs," sections through the jambs of doorways and jambs and mullions of windows; and in these are given an immense number of those mouldings which are made of so great account in the chronology of English Gothic Architecture. It is, we repeat, a scholar's book. The material is drawn from a thousand sources; the illustrations from the old books, Brandon, Sharpe, Pugin, Parker, Colling, Johnson, Wickes, and the rest, and from many recent writers as well; the text from many authorities, who are here recognized fully and balanced one against another. There is no pretence of original knowledge, like that which we had to reckon with in the case of Mr. Bloomfield's book recently reviewed in these columns; no claim of that exemption from ordinary rules of literary production which is sometimes asserted for the practised artist, less familiar with criticism than with production.

One approach only to practical knowledge is claimed by Mr. Bond: his work with photography. Indeed, he says that "it has been the writer's pleasant task to visit nearly every important church in England, camera in hand." This work with the camera means a great deal of observation, a great deal of prying into details, the constant exercise of choice with regard to points of view and the truest effectiveness of a composition. And so the

author has been able to study his subject, no doubt, while photography has also made it possible to include the wealth of illustration advertised in the title.

A chapter is devoted to definitions, and the reader plunges at once into that controversy with Mr. Bond's predecessors in the field, which is hardly to be avoided in a book pretending to encyclopædic fulness. Mr. Bond is sure that "architecture is the art of building in general," and will not hear of any limited definitions more restrained because intended to be more accurate. However, the precise definition of such great and comprehensive terms is as nearly impossible as any intellectual task can be. The word Romanesque is taken up, and Quicherat's perfect and logical definition is dismissed at once (p. 6) as not explaining the whole body of the art—seven centuries at one effort and in twenty words. Then there is given the definition of Anshyme St. Paul, which is ingenious and critical, and embodies a brief history of early Christian architecture. Then come Viollet-le-Duc's words about Romanesque, which are also historically accurate if not quite comprehensive enough, and this last formula is accepted by Mr. Bond, if we understand his meaning aright. But even here there is doubt, because a footnote admits the extreme uncertainty which we know to exist as to whether the term Romanesque should cover many schools, East and West, or one school only. These doubts, once stated, leave us ready to receive the impression of quite infinite uncertainty as to the meaning of Gothic; yet we welcome so much of certainty as that which binds the Gothic style inseparably to Romanesque as being the greater and more refined thing to which the cruder style led up.

Chapter II. deals with the characteristics of Romanesque; four chapters deal with the characteristics of English Gothic; fifty pages in Chapter VII. present a "chronological history of the greater English churches" (a matter quite separate from the list of dated buildings mentioned above); and so with p. 145 begins Part II., and that which would seem to be the real subject of the book. This part, divided into 34 chapters and containing 500 pages, is a very complete analysis of mediæval church architecture in England; and the reader is reminded that the secondary title, as given above, limits the subject to the English churches for four centuries and a half. This analysis is pushed so far that the pillar or pier is treated as a principal subject in two chapters, and elsewhere in connection with the vault; that the vault itself, with its buttresses, takes up seven chapters, and that other chapters are specially told off for the minor constructional elements on the one hand, and on the other hand for the great features of the plan—the choir, the nave, the galilee, the transept, eastern and western, the porch and the Chantry Chapel.

We have, then, an all-embracing work like a cyclopædia of a special subject, but arranged logically instead of by alphabetical sequence. The danger here, as in other cyclopædias, is of omitting very important considerations. How can the author and compiler be sure that every important form of window-tracery and every

important element in its growth and decline has been thought of and presented in its proper place? How can he guarantee it, and how can the reader feel assured that the mediæval capital, for instance, has been fully analyzed? These questions, however, are of little importance to those who consider that here is an enormous amount of matter, rather novel in its sources and certainly novel in its arrangement; that all this matter is made fairly easy of access by indices; and that, under any circumstances he, the student, would have to turn to other books—that no one work contains all the information which might reasonably be asked for.

Greek Theories of Elementary Cognition. By John I. Beare. Henry Frowde.

Greek psychology, in the sense of the doctrine of the "Soul," is treated at large in the voluminous but uncritical work of Chaignet. Without committing himself to any dogma of "psychology without a soul," Professor Beare, of the University of Dublin, has seen that "Greek Theories of Elementary Cognition from Alcmaeon to Aristotle" is a much more definite and profitable topic of study. As respects the ultimate problems of epistemology and the relation of mind to body the progress of science has added little to the speculations of the Greeks; and Plato's "Theætetus," rightly interpreted, says the last word far more effectively than either the physiological psychologists or the neo-Kantians of to-day can say it. It is still true that we do not, strictly speaking, see with the eye or hear with the ear, but through them. It is still "a monstrous supposition that a mob of sense-perceptions sits within us (like the Greeks in the Trojan Horse) not unified by the apperception of some central form, call it soul or what you will."

What Professor Beare has done is to set forth the theory of the five senses as it appears in Alcmaeon, Empedocles, Democritus, Anaxagoras, Diogenes of Apollonia, Plato, and Aristotle, supplemented by a discussion of the common features of sensation in general, and the Aristotelian doctrine of the *sensus communis*. The texts of the Pre-Socratics were already collected for him in Diels' "Doxographi" and "Vorsokratiker." He has translated, paraphrased, and explained the relevant passages, and so provided an interpretation which scholars must consider, and a trustworthy book of reference for those who cannot use the originals. More interesting in continuous perusal are the concluding chapters on sensation in general and the *sensus communis*, which present the substance of the Platonic and Aristotelian psychology with the omission of Plato's "proofs" of immortality, and the hopeless controversy concerning Aristotle's doctrine of the noetic soul.

Judicious as these limitations and the attempted exclusion of epistemology may be, the result is a somewhat distorted impression of the true relation of Plato to Aristotle and of the real character of the Aristotelian philosophy. Professor Beare may not share, but his book will confirm, the prevailing idea that as Aristotle undoubtedly had more of the scientist's patient enthusiasm for detail than his master, so his thought is more truly scientific than Plato's.

Yet in fact Aristotle's acceptance of the heart as the sensory centre is a distinct retrogression from Plato's teaching, and his doctrine of a common sensory is not so near the truth as we apprehend it, as is Plato's reference of the intellectual and universal element in sense-perception to the synthesis of the mind. The rigid separation of synthesis in sense perception from the synthesis of thought categories is the chief error of Kant, or of one interpretation of Kant. As Professor Beare himself admits (p. 260), "no psychologist has ever been able to answer satisfactorily the question where sense perception ends and thinking commences." Why, then, should he treat Aristotle's confused and inconsistent theory of a common sensory as a distinct advance upon Plato? The historical importance of the doctrine justifies the interesting chapter which Mr. Beare devotes to it. But only the *à priori* superstition of progress can treat it as a real step in advance.

Mr. Beare's scholarship is sound: He challenges Diels not unsuccessfully in the interpretation of Empedocles, and proposes (p. 321) an ingenious if unprovable solution of the well known *crux* in "De Memoria," 452b, 17-24. He rarely errs unless it be where doubt is permissible. On page 51 the reference of *ἐκείνων παθήματα* in Tim. 67c. seq. should be not to *τοῖς τῆς ὄψεως μέρεσιν*, but to *τὰ φερόμενα . . . μόρια ἐπιπίπτοντα*. Compare Tim. 43c. *τὰ τῶν προσπιπτόντων παθήματα*, and 61c. *τὰ δὲ παθήματα αὐτῶν*. The useful bibliography shows that Mr. Beare has studied the literature of his subject. He strangely overlooks Rodier's monumental edition of the "De Anima," a reference to which would have helped his interpretation of the technical term *μεσότης* which Zeller misapprehends.

The Religion of Numa, and Other Essays on the Religion of Ancient Rome. By Jesse Benedict Carter. New York: The Macmillan Co. \$1.

The five essays of this little volume aim to give merely an outline sketch of the development of Roman religion, from the earliest period accessible to modern research down to the death of Augustus. As a pupil and admirer of Georg Wissowa, Professor Carter bases his work on the results of careful research, and has supplied a much-needed introduction to the more extended and difficult literature of the subject. While accepting in general his correction of current misconceptions concerning the various accretions upon the primitive Roman faith, from Greek, Egyptian, and Asiatic sources, one may question whether the effect of these accretions was so wholly bad as the author seems to regard them. Dr. Samuel Dill has well emphasized the fact that certain of these Eastern cults had in them elements of a higher spiritual life than could be developed out of the older Roman faith unaided, and that the Roman tendency to resort to them was often the result of a genuine soul-hunger for just this higher side, and not for the demoralizing features associated with it. To the introduction of Apollo, probably from Southern Italy, towards the close of the kingdom, is attributed the later arrival of the Sibylline superstition, with all its harmful accompaniments. Was the welcome of the Sibyl, however, really the cause of the religious degradation so

naturally associated with it in thought, or was the Sibyl seized upon as an appropriate tool for deteriorating forces already effectively at work? It is somewhat like the question whether Americans take to drink because so many foreigners keep saloons, or whether so many foreigners keep saloons because Americans take to drink.

The chapter on the religious renaissance promoted by Augustus is deficient in its dealing with the literary phase of the Emperor's efforts. The extended building and repair of temples, with rigid Imperial attention to the demands of official worship, could do much on the formal side, but, so far as there was any genuine religious life in this renaissance, its awakening was more largely due to a few of the great literary men to whose genius the Imperial court gave encouragement and direction. Professor Carter assigns an important place to Virgil in this field, but the work of Horace is strangely neglected. It is easy to think of Horace as an easy-going man of the world, fairly moral for his age, though caring little for the deeper phases of moral truth; but such is not a correct conception of him. When one reads his entire work with proper attention to the chronology of its composition, assigns much of the lighter part of it to its true Greek origin, and takes at its face value the large proportion which deals sensibly and seriously with actual conditions and springs from the depths of the poet's heart, he will recognize in Horace an instrument as peculiarly fitted to promote the religious policy of Augustus in the lyric field as was Virgil in the epic. No account of the religious movement of the time can be well balanced if it takes no note of him, especially when such evidently inferior religious forces as Tibullus and Propertius are mentioned. We accept as some redress for the grievance of this omission, however, the author's full recognition of that strong and steady undercurrent of genuine though uneventful religious life which flowed right on beneath the surface during the entire period—the solid, though comparatively unthinking, religious and moral basis upon which alone any religious reform, in any land or age, must build.

Journal de L'Estoile: Extraits publiés avec une Notice Bibliographique par Armand Brette, et précédés d'une Introduction par Edme Champion. Paris: Armand Colin. 1906.

M. Champion evidently believes that popular illusions about the "good old times" are not to be classed with harmless errors, but rank among those baneful superstitions which retard the advance of mankind. In his selections from the correspondence of Gui Patin he showed the seamy side of French life during the best days of Louis XIV., and he now draws further illustrations of savagery and ignorance from the period of the later Valois. There are, indeed, other reasons for presenting the memoirs of Pierre de l'Estoile in reduced form, since the original work occupies twelve volumes and is marked by a certain monotony of style which will always prevent it from becoming a rival of Brantôme or Saint-Simon. We feel sure, however, that the present editor is not simply concerned to present, for the sake of vulgar-

ization, a selection of passages from a forgotten author.

A special motive becomes manifest as soon as one has read the last part of the introduction, a chapter wherein M. Champion discusses the French Revolution in the light of the League. La Harpe contended that the Revolution, by virtue of its monstrosities, formed a unique epoch in history, and for the last century this statement has been reiterated by popular writers of every rank from Jephson to Taine. What particularly disturbs M. Champion is the allegation that the excesses of the Terror are ascribable to the philosophical writers of the eighteenth century. When, for example, the Abbé Maury maintains that, truly considered, the execution of Louis XVI. is the work of the Philosophers, he is unable to quote passages from Rousseau or Diderot in favor of regicide simply because they do not exist. On the other hand, the most superficial knowledge of sixteenth-century literature shows how the theologians of the League cited the Bible to justify the murder of Henry III. We select a single passage to indicate how M. Champion stands in this matter as against the clericals who hold up the French Revolution to the execration of mankind.

When L'Estoile writes: "It is the ordinary practice of a Leaguer and the infallible sign of a zealous Catholic always to have the mass and religion on his lips, brigandage at his heart, blood and murder on his hands"; when he adds that "the most execrable parricides and assassinations are deemed miracles and works of God," that the preachers excite popular insolence and fury by their attacks upon the King, whom they style a dog, a tyrant, a heretic (thus making him hated by the crowd), he has under his eyes "placards published at Paris, printed with the license of the Holy Union, seen and approved by doctors of theology."

Moreover, these are not the statements and comments of a Huguenot. L'Estoile was a Catholic.

The "Journal" itself is a most valuable document, and the way in which M. Champion uses it furnishes a striking illustration of the animosity existing between the clericals and liberals of modern France. L'Estoile, like L'Hospital, belonged to the third party, the party of the Politiques, who viewed the recriminations of Leaguers and Huguenots in the spirit made known to us by Montaigne. The passages here brought together are a gruesome revelation of what can be done when the cause of religion is made a cloak for party hatred. Many people think of Vassy and Saint-Bartholomew as isolated episodes, though not only was the spirit which prompted massacres present in France for a whole generation, but there is hardly any break in the chain of atrocities from the beginning of the first civil war under Charles IX. to the accession of Henry IV. Voltaire thought L'Estoile an over-credulous chronicler of the gossip he got in the street. This criticism has some force, but only as it affects details of the "Journal." The record, as a whole, was made in good faith by a man of moderate spirit who hated the excesses of the Huguenots no less than those of the Leaguers. For the historian it is a vast magazine of social facts; to the aspiring but discontented citizen it furnishes a cheering standard of contrast.

Papers of the Military Historical Society of Massachusetts. Vol. V.: Petersburg, Chancellorsville, Gettysburg. Boston: Houghton, Mifflin & Co.

This collection of papers read before the Military Historical Society of Massachusetts is, like most collections of the sort, of unequal value. One series, however, making up about one-half of the volume and dealing with the events that passed between Grant's repulse at Cold Harbor and the failure to take Petersburg two weeks later, is of exceptional interest and value. Of the seven contributors to this page of history three deserve special mention: Gen. W. F. Smith, who failed to take Petersburg and here makes his defence; John C. Ropes, who states the case with his usual clearness and method; Col. Lyman, who, with his racy observation and keen sense of humor, gives us the best reading in the volume.

Several points are brought out by these papers for which one would search our histories and even the War Records in vain; let us take them in order of date. After Lee had thrown back the Federal army at Cold Harbor, Grant's first move of importance was to detach Sheridan with the cavalry corps on a raid to the west of Richmond. As a raid this movement accomplished nothing, but it had an indirect result that nearly proved of decisive importance, though there is no evidence to show whether or not Grant foresaw this. On Lee's finding that the Federal cavalry was raiding in his rear, he detached the bulk of his own cavalry under Wade Hampton to check the movement; the absence of his cavalry led to his failing to keep in touch with the remarkable advance that Grant began on the 12th of June, five days after Sheridan had been detached—a fact that nearly cost Lee Petersburg and Richmond.

Having made up his mind that nothing more could be done to the north of Richmond, Grant decided to carry his army across the James and to attack the Confederate capital from the south. In this movement there were two notable features, first, the transportation problem; secondly, the offensive climax of the operations. The transportation problem was solved splendidly in every detail, for in three days over 100,000 men with long trains of wagons and great herds of cattle—and with Robert Lee on their immediate flank—were marched fifty miles, crossing one small river, the Chickahominy, and one great estuary, the James. On this problem Grant had successfully concentrated all his wonderful abilities; but did he as carefully work out the details of the military operation that should have crowned this great manœuvre? The answer appears to be that at this point Grant fell short of the highest standards, and that his measures were only half measures, lacking that thoroughness of detail which carries success.

The passing of the army across the James was but a means to an end, a means to attack the Confederates in a position more vulnerable than that occupied by Lee at Cold Harbor. That position was Petersburg, twenty miles south of Richmond, where several lines of rail converged from the South and West. Now Petersburg was all but denuded of troops. Lee was bound to

mass every available man against the main Federal army, and, what was more, he believed until late in the afternoon of the 17th that Grant was still to the north of the James River. For two days, therefore, Grant was in a position to concentrate overwhelming numbers against Petersburg, but the efforts he made all failed.

Space will not permit an examination of the various causes of the failure to take Petersburg; only three of them must receive brief notice. First, it may be concluded that in June, 1864, Grant had not yet attained the clear perception of the best tactical employment of massed cavalry that he displayed in April, 1865. Had Sheridan's corps been in the van instead of Hancock's, W. F. Smith would certainly have been reinforced in the afternoon of the 15th in time to complete the partial success he had won and to carry Petersburg. Secondly, the dual arrangement whereby Meade commanded the army and Grant commanded Meade, was a false one and had a bad tendency. Thirdly, the staff and higher command was insufficiently organized and improperly selected. It makes one hot with indignation, even now, half a century after the events, to think that, after three years of terrific fighting, it was possible that political corruption and moral cowardice should still be sending to their death brave men under an incompetent grafter like Butler or a drunken coward like Ledlie, described by his own officers as "lying on the ground in a drunken stupor," or "soliciting and obtaining whiskey to stimulate his courage while his division was fighting at the front." Is it any wonder that Grant's plans sometimes failed when their execution was entrusted to such men? And the question of staff organization is nearly akin. Devoted and able officers made serious blunders owing to their lack of a proper staff education, as, for instance, in the matter of Hancock's orders on the 15th of June and in that of the handling of the information as to the state of supply of the Second Corps—a decisive fact, as a trained staff officer would have known.

In conclusion, the Society may be congratulated on a carefully prepared and valuable volume.

The Reformation in England. By S. R. Maitland. Illustrated. New York: John Lane Company. 1906. \$1.50 net.

This book, although the publishers do not note the fact, is a reprint of a series of essays written more than sixty years ago for the old *British Magazine* and issued afterward (1849) with additions and modifications by the Rev. S. R. Maitland, who died in 1866. The essays, owing to their technical character, have been less popular than Maitland's "Dark Ages"; but until a recent revival of interest in Maitland's writings resulted in a reprint of both volumes, even "The Dark Ages," long out of print, was known to modern students of mediæval history chiefly through references in bibliographies.

Maitland was a man of books rather than of affairs, a writer of great learning, who for many years was librarian at Lambeth Palace, and missed a bishopric mainly because of his eager championship of what he believed to be true both historically and theologically. He was especially gifted with

critical acumen, loved an honest controversy, and proved a dangerous opponent to those whose zeal outran their knowledge. As a critic, he was in advance of his time, for he lived in an age when men were either unwilling, or not sufficiently interested, to test the truth of the ecclesiastical histories then current, and when evidences of credulity and partisanship were likely to be found in such works. "The Dark Ages," he said, "were dark only to those who would not understand them"; and he might have added with truth that other accepted views continued to be erroneous because men would not take the trouble to test them by impartial criticism. Though a loyal and orthodox Anglican, he was almost the first Protestant writer in England to do full justice to the work and influence of the Roman Church in the early Middle Ages. He had a delightful sense of humor, a pleasant style that in his essays becomes almost conversational. He was one of the kindest of men, and, like the late Prof. York Powell, opened freely his stores of knowledge to all who sought him with serious intent.

His "Essays on the Reformation in England" are really studies in historical evidence—the evidence of men like Fox, Strype, Burnett, Paget, and others, whose writings up to that time had been the main source of information for much of the history of the Early Reformation in England. Except for two volumes of State Papers published in 1830, there existed in Maitland's day no official documents of the sixteenth century in print, and writers on the Reformation had to depend on the writings and chronicles of participators and partisans, such as Joye, Greene, Bale, Fox, Knox, and Bradford, either contemporary or nearly contemporary with the events they narrated. Maitland analyzes this evidence with great skill, running to earth exaggerations, noting omissions and suppressions, inconsistencies and contradictions, and laying stress upon instances of deliberate falsification, ribaldry, and political bias. He deals with Calvinist, Anglican, and Roman Catholic alike, and displays no small amount of courage in charging the enemies of the Church of Rome with distortion, trickery, and deceit, particularly in matters relating to the career of Bishop Gardiner and the Marian persecution. Such an outspoken and fearless defence of truth did not increase his popularity among his Protestant brethren, and in part cost him preferment, but it has given him high rank among English historians. The influence of these essays upon the writing of the history of the English Reformation has been great, but so mild and unoffending are they that it is not easy for us, in the presence of modern historical criticism, to understand their revolutionary character. They are deserving of reprinting, not only for their own sake, but also as a tribute to the ability and learning of a great English scholar.

Hawaiian Yesterdays: Chapters from a Boy's Life in the Islands in the Early Days. By Henry M. Lyman, M.D. Chicago: A. C. McClurg & Co. 1906. 8°, pp. xii., 281. Ills.

This is the story of a son of a missionary to Hawaii. The father, a Connecticut boy, educated at Williams College and Andover

Seminary, married a Vermont girl, Sarah Joiner in 1831. A few weeks later, with eight other young couples in similar case, they sailed from New Bedford on the long voyage around the Horn. After six months they arrived at Honolulu, and were allotted to the island of Hawaii, where, among the resident missionaries already on the spot, they could learn the language and prepare themselves for their future duties. Ten months after their marriage they began housekeeping in a native house, built chiefly of bamboo and thatched with cane-leaves.

The original idea of the Board was, that its missionaries were sent out for life, that they should live in houses like those of the natives, and subsist upon the coarse and unfamiliar native fare. After much consequent suffering, the managers at Boston finally perceived the poor economy of thus sending educated and capable men and women to inevitable disability and premature death. They began to send lumber for the erection of sanitary and civilized dwellings, and medical men to look after the health of their colonists. Mrs. Lyman suffered seriously from the conditions under which she was obliged to live; her first child did not survive, and the health of the second, the author of this attractive little volume, was for some time trembling in the balance. The book recounts the boy's memories from the time when he could first appreciate his surroundings, to the period when he left the islands with a view to entering an American university and acquiring a professional education.

Those familiar with the conditions of missionary life in such situations at that early day do not need to be told that luxury and selfishness formed no part of it. Others, who have listened to the criticisms of sailors and commercial adventurers, may find their conceptions of that life acceptably cleared by reading this book. A society which produced, for example, an Armstrong of Hampton in the second generation, stands in need of no defence, though an exposition of it may be welcome. This is not a history, an ethnological treatise, or a Sunday-school book, but a pleasantly-told account of the boyhood of a missionary's son in a strange land. As such, we can cordially recommend it. If some other son of worthy sires could take up the story where the author has left it, and carry it on to the more modern era of steam and regular packet service, it would be a praiseworthy undertaking. Our chief criticism is that the narrative seems to terminate somewhat abruptly, leaving the curiosity and interest it awakens not wholly satisfied.

La Fondation de l'Empire Allemand. Par Ernest Denis. Paris: Colin.

This exceptional book marks a turning point in historical knowledge and opinion. It is high time that the world should realize that von Sybel and the other German historians of his period were the victims and interpreters of the political passions of their day. It was, in truth, a great period for Germany, and one would think less of the German whose heart had not beat faster during those anxious years during which Bismarck wrought out the modern German Empire. And if even the illustrious Mommsen, whose studies were

of ancient history, could not keep the Hohenzollerns out of his books, surely one may not show disrespect to that far less eminent historian, Von Sybel, in stating that his widely read work on the foundation of the German Empire is more a political pamphlet than accurate history.

For many years after the Franco-Prussian war French writers shunned the subject and left the events of 1870-1871 to be interpreted to the world by the Germans. It is only recently that they have awakened to the fact that history was rapidly becoming perverted, and now we have at last a first-rate book dealing with the events that brought Prussia from the revolutions of 1848 to the culmination at Versailles in January, 1871. Even with the French historical school so strong as at present, it is not too much to say that his present work should earn for Professor Denis a conspicuous reputation. His erudition is searching, his presentation able, his style easy and in passages marked by a stimulating strength of irony and independence of thought. As a rule the most rigid impartiality prevails, and the German achievements are not in the least minimized; towards the end, however, this quality grows less conspicuous. In his account of the Franco-Prussian war Professor Denis cannot entirely forget his own nationality, nor are his military criticisms altogether convincing. Even in the earlier years there are slight shortcomings, as in the account of the Benedetti-Bismarck negotiations of 1866.

Yet as a whole the book is not only of capital importance for the history of the nineteenth century, but it also marks a step in a healthy direction in the methods of historical study. Nothing could show more clearly how fast the reaction is setting against the extremists who have pronounced history to be a science and nothing more than to find a professor of the University of Paris, whose erudition is unimpeachable, disclaiming such a position and backing up his disclaimer by suppressing all footnotes and all references to authorities. This may be going too far, but it is a healthy sign, and the author may be warmly congratulated on his courage and on his remarkable book.

The Constitutional History of New York, from the Beginning of the Colonial Period to the Year 1905; Showing the Origin, Development, and Judicial Construction of the Constitution. By Charles T. Lincoln. 5 vols. Rochester, N. Y.: The Lawyers' Coöperative Publishing Company. \$15.

We are sorry not to be able to give much space to a work like this, which is not only a monument of industry and research, but a useful historical and legal compilation as well. The author is well qualified for his task, as he was a member of the convention of 1894, and for several years chairman of the Statutory Revision Commission, besides having been legal adviser to three governors.

We can best give an idea of what the book is by saying that it is arranged both historically and by topics. As a whole, it is the history of the constitution of this State, traced from its earliest sources in Magna Charta and the "Charter of Liberties" down to its present form, accom-

panied by explanations of the political and social changes underlying its development. But, being arranged also by subjects and having a whole volume of tables and indices, it is easy to find either the chronology and rationale of any particular topic—*e. g.*, suffrage, civil service—or, what is often of quite as much importance, the part played in the development of the Constitution by any particular person—*e. g.*, Gov. Tryon, John Jay, J. H. Choate (volume iii. is mainly devoted to the Constitution of 1894, but contains in an appendix the commission and instructions of Tryon—the last expression of the wishes and policy of the old régime, before the adoption of a State government). Of course, the constitutions and amendments come in their historical order, beginning with that of 1777, by no means the worst of them, said to have been in great measure the work of three statesmen, of whom the oldest was thirty and the youngest twenty-four at the time of their appointment.

A characteristic portion of this constitution was the Council of Revision. A veto power over legislation was given to a board consisting of the Governor, the Chancellor, and the judges of the Supreme Court. Under this system of preliminary judicial revision, very few constitutional questions seem to have come before the courts. How it would work today is another question. That was an age in which suffrage without a property qualification was a mere suggestion of system-mongers; in which the idea of an elective judiciary was still a dream, and when almost everybody who had a substantial office held it by appointment. How rapidly the democratic tide rose is recorded unerringly in these volumes. By 1821 the Council of Revision had become antiquated, and property qualifications were beginning to be lowered. By 1846 the manorial system was swept away, offices and elections were democratized, and the modern period, which was to be marked in another half-century by a growing dislike of the administration of justice itself, came in. By 1875 it was found already that the experiment of a very restricted property qualification in cities proposed by a highly competent commission was not to be thought of. In 1846, people were still really afraid of monarchy and feudalism. Mr. Simmons of Essex County is quoted as saying that he could "tell a man from a feudal region by the very expression of his countenance." Volume iv. is devoted to an annotated Constitution, and among the tables will be found a valuable classification of statutes as they come under the heads Constitutional or Unconstitutional.

Peasant Life in the Holy Land. By the Rev. C. T. Wilson. With illustrations. New York: E. P. Dutton & Co., 1906. Pp. x. and 321. \$3.50 net.

The writer of this book was formerly a missionary of the Church Missionary Society in Uganda and Palestine. In his preface he speaks of "a long sojourn in the Holy Land" and an intimate acquaintance with the people. That he has such acquaintance the text itself makes plain, but the length of his sojourn is not stated. Evidently he was in Palestine as recently as 1901, and he refers to conditions, apparently as of his personal experience,

which existed in the middle of the last century. We venture to think that, so far as conditions antedating 1880 or 1885 are concerned, he has derived his information from others, and that the apparent personal connection with earlier conditions or events is an accident of presentation. The book is in general a simple description of the manners and customs of the peasants as Mr. Wilson saw them in various parts of the country, but especially about Jerusalem. He describes minutely their dwellings, implements, food, marriage and burial customs, and the like. As he points out, the building of railroads, the greater facility of intercourse with foreign countries, resulting in an influx of tourists, the importation of foreign goods and the disappearance of native manufactures, emigration on a large scale, the increase of schools and the spread of education, especially through missionary endeavor, the change in land tenure, which has largely broken up communal holdings by villages—all these are producing something like a revolution in the social, economic, and religious conditions of Palestine. His "apology," as he puts it, for writing this book, "recording the manners, customs, language, etc.," of the peasants of Palestine, is the rapidity of these changes. All that is ancient and peculiar is vanishing, and Palestine is becoming a suburb of Europe.

Mr. Wilson's knowledge and experience render his observations of much value. He seems to have lived among the people of the villages and tents and to have come into familiar and sympathetic touch with the peasantry, among whom naturally the oldest usages are preserved. In many re-

gards, as he rightly notes, the modern peasant reflects the conditions not only of Bible times, but even of the times preceding the occupation of Canaan by the Hebrews. The town dwellers, on the other hand, have been much affected by foreign thought and habits not only now, but at all periods; while the Jews, who have recently entered Palestine in such great numbers, are, so far as customs and religion go, modern interlopers, from whose life nothing can be learned regarding ancient times. For its presentation of the actual facts of peasant life this unpretentious volume is a valuable supplement to works already in existence on manners and customs and to a less extent on the language and folklore of Palestine. When it comes to explanations, generalizations, matters of history, exegesis, comparison of religions and the like, the limitations of the author's equipment and the narrowness of his outlook render his remarks less useful. He seems, for instance, to think that the Gypsies were in Palestine in the time of the Judges (p. 87), and that the Druses have inherited the calf-worship of old Israel (p. 34). Fortunately he occupies himself chiefly with what he has seen and thus has relatively little chance for that sort of foolishness.

The book is simply written, readable, and illustrated with a goodly number of photographs. It gives a picture of the better side of peasant life, and incidentally is of considerable value to the student of Oriental and Biblical archæology, folklore, and religion.

Audrey Craven

By MAY SINCLAIR, Author of "The Divine Fire" and "Superseded." \$1.50.

"Superseded," the earlier work by Miss Sinclair, has been so favorably received that her publishers are encouraged to issue another work, "Audrey Craven," which some of the most discriminating admirers of Miss Sinclair rank even higher than "Superseded."

Audrey Craven is a pretty little woman with copper colored hair and the soul of a spoiled child. Though "a good woman," she has a fatal fascination for most men. There are telling glimpses of the life of London writers and illustrators and not a little humor.

The Nation.

NEW YORK, THURSDAY, AUGUST 16, 1906.

The Week.

Senator Cullom of Illinois is preparing to exert all his influence to secure the Presidency for his young friend, Joe Cannon, in 1908. "A resolution for Cannon," he says, "will go through [the State convention] like greased lightning, if he doesn't stop it himself." Mr. Cullom, who was a sturdy youngster of six when Mr. Cannon was standing pat in his cradle, naturally feels an interest in his protégé. However, all booming of Cannon—the fall of the words cannot be helped—harks back to that extraordinary afternoon in the spring of 1904, when William Alden Smith, haltingly, named the Speaker for the Presidency, and his colleagues gave such a demonstration of loyalty and enthusiasm as the House had hardly seen in a generation. He has the winning qualities, and it is already decided that he is to be the mainstay and dependence of this year's Congressional campaign. We have elected one President who was within four years of the age Mr. Cannon will have attained in 1908. The other party has nominated a Vice-Presidential candidate nine years older. But if "Uncle Joe" were a hundred and one, he would still occupy a unique place—a stand-patter who can put his views into practice without enraging the revisionist Republicans, an implacable foe of the Senate who finds a Senator the chief sponsor of his cause, a despot whose subjects love him even when he throttles their legislative children.

Representative Gardner of Massachusetts, better known as the son-in-law of Senator Lodge, is calling for a strong tariff-revision plank in the Republican State platform. He would like a flat demand for free hides and free sole leather. But the true question is whether Massachusetts Republicans think of such a "demand" as merely a means of stealing Democratic thunder, and quelling a revolt within their own party, or as something for which they really intend to vote and fight. Last year's platform in Massachusetts called for "present action" in the matter of tariff revision; and Gov. Guild later assured President Roosevelt that, but for that official position, with its implied promise, the Republicans would have lost the State. But how long will Massachusetts Republicans be content to feed on the husks of insincere platform pledges? Along in the early nineties, several thousands of them got into the habit of voting for a Democratic Governor; and shortly afterwards Massachusetts manufacturers got

free hides and free wool. It may occur to them now that, if they really mean business, they cannot do better than try that old plan over again.

Hopeful, undiscouraged Canada is again preparing to "make an opening for a reciprocity agreement with the United States." It is easy enough to make openings of this kind. The Canadian side of our tariff party-wall is fairly honeycombed with them. The difficulty is that we will not complete the work by digging through our half of the masonry. One day a sturdy Massachusetts workman comes along with his mallet and cold chisel and begins knocking out a few chips, when suddenly a hand is laid on his shoulder. It is the senior Senator, the Hon. Henry Cabot Lodge. "Stop, misguided man," he cries in a woodman-spare-that-tree tone of voice. "It is true that beyond that wall are some millions of customers to whom you and your friends can sell the products of our State. But reflect. There is also waiting at the half-completed gateway a man with a wheelbarrow full of herrings which he will bring here for us to eat without selling them to an American fisherman first." The man with the chisel shudders and departs. After him, perhaps, comes a Minnesota miller anxious to knock down the wall, bring in grist, and double his output. But a spokesman for the American farmer dissuades him. The American farmer's prices, except for the machinery and goods he buys, are not fixed by the tariff; but he believes they are, and the reluctant miller stays his hand. So the old comedy goes on, the scene merrily shifting occasionally from Ottawa to Washington.

Mr. Harriman's counsel, at the excited meeting of the Wells-Fargo Company last week, gave us a new definition of high finance. As reported in the *Times*, Mr. Cromwell said of Harriman: "He cannot be replaced, for he moves in a higher world into which we may not enter." The *Sun's* report reads: "There is a higher world where the stockholder cannot enter." Taking the two statements together, it is pretty clear what that higher world is. It is the world of the surplus and the declaration of dividends. The mere stockholder, like the policyholder under the recent insurance régime, is guilty of something like sacrilege in venturing near that sacred place. His proper attitude is to sit in reverent awe while the dwellers on the financial Olympus do what to them seemeth good with other people's property. Though they slay him, yet must he trust them. Who is the stockholder,

poor, weak, and erring mortal, after having turned over his money to Mr. Harriman, to say to such a higher intelligence, "What doest thou?" Mr. Cromwell's reminder is timely and wholesome. We see reverence and faith decaying all about us. Rash levellers would pull down even our greatest and wisest. In such circumstances, it is well to have an authoritative voice calling the world to worship once more, telling us earnestly that man cannot get on without having some noble ideal above himself, and pointing us all to the irresponsible financier, who deals with surpluses and dividends according to the dictates of his sovereign will, as the true object of our adoration.

"If there's anything in these accusations against Standard Oil, why doesn't somebody bring them into court?" That has been said so often by the oil company's apologists that there is a peculiar satisfaction in the fact that some one has brought the allegations into court. At least, a special Federal grand jury in Chicago has indicted the company on nineteen counts for receiving illegal rebates from the Lake Shore Road. If convicted, the defendant may be fined \$380,000, or almost exactly three and one-half days' dividends on a basis of last year's returns. But from the public's view, the really interesting feature of the coming proceedings will be the definite test of the Standard Oil Company's much-celebrated reformation. Of course, it once took rebates, so its counsel has pointed out, but that was when rebates were no more illegal than terminal or demurrage charges. And since then it has observed the scrupulous letter of the law. "It says so, and it ought to know." Besides, Chancellor Day and the Rev. Dr. Robert Stuart MacArthur have made personal inquiries and found the Standard Oil to be law-abiding above other corporations. Yet the indictments specify offences which are recent. They are embraced between August, 1903, and February, 1905, and this period, be it noted, includes the explicit denials both of the company itself and of its unofficial defenders.

The Pan-American railway project, which the Rio conference is again bringing to the front, gains much of its undoubted fascination from its unusual combination of the practical and the imaginative. No stretch of railway is being constructed in South or Central America with the special purpose of serving as a link in the connection between New York and Buenos Ayres. Yet when a country along the proposed route appropriates money to build at all, it

lays its tracks, other things being equal, in such a way that they may serve that ultimate purpose. Every time the account of mileage is cast up it shows progress toward the long-cherished dream of joining the two continents, and yet little outlay has been made on lines that are not justified from a business standpoint. Charles M. Pepper, a member of the Permanent Pan-American Railway Committee, writing in the last number of the *National Geographic Magazine*, says: "In the inter-continental or Pan-American trunk line project undoubtedly there will be long halts before all the gaps in such sections as those between Cuzco, in Peru, and Quito, in Ecuador, are completed; but all this is easily within the vista of half a century." Since one of the South American republics, Argentina, is to hold next year a celebration of the semi-centennial of its first railway line, this would make the entire work the project of a century.

So Chinese laborers are to dig the Panama Canal after all. We cannot get enough Spaniards, we cannot get enough West Indian negroes, and labor from the United States was never within the range of possibilities. Therefore the despised coolie is to come in under bond, do the work we want quickly, efficiently, economically, and without disorder; and after it is done, he is to be packed off home. It is a useful function which the Panama Canal is performing in furnishing the plainest possible object lessons of some of the economic and political principles which at home are involved with other considerations. It was shown last year, for instance, just how much additional the canal will cost because its supplies are bought at tariff-created prices. There are a million similar exactions at home, but they do not stand out so clearly. Now it is shown that the most satisfactory way to get the coarse work done is to admit the Chinaman.

By the addition of Representative Longworth, the group of Congressmen to be opposed by organized labor this fall is brought startlingly close to the very seats of the mighty. Speaker Cannon, Mr. Littlefield, and Representative Goebel are the others who are now known to have definitely displeased the American Federation of Labor. As we understand it, the labor "blacklist" exists only by implication. It is really a "white-list" of statesmen which Mr. Gompers and his associates are preparing. The Republicans and Democrats are to be notified as to which of their nominees meet the requirements. Presumably, if a listed candidate opposes an unlisted one, he will get the support of the unions in that district, while in the event of two unlisted candidates be-

ing in the field, the Federation will make its own independent nomination. It is rather interesting that the first endorsement by either party of the Federation plan comes from the Democrats of Iowa, who elected just one Representative to the Fifty-eighth Congress and failed to return him to the Fifty-ninth. It may be in the case of forlorn hopes like this that organized labor will have its greatest success in forcing nominations.

It is reported that Mayor McClellan is studying the taximetre system in Paris and Berlin with a view to its introduction in New York. Whether as a clever mechanical device or as a contribution to the amenities of foreign travel, the taximetre is interesting. It has enlisted the learned men of the Institut de France to determine its middle vowel, and it has effectually disproved the theory that a cab business cannot be done on a low minimum fare. When Paris and Berlin cut the traditional fare in two and put in the taximetre, it was found that the new cabs got an enormous amount of new business in short courses. The thrifty Parisian or tourist who would not pay 30 cents to drive half a mile from café to theatre, willingly paid 15 cents. The taximetre cabs got a great many more fares than the others. There could be no clearer demonstration that the profit of the cab business is determined less by the individual fare than by the number regularly taken in the day's work. One can imagine, for example, an enormous increase in the use of cabs if, instead of a minimum of 50 cents a mile, one of 25 cents a half-mile were introduced.

Since the Smithsonian Institution at Washington is now adjudged to have the powers of a national museum of art, its hesitancy in accepting the splendid proffer of Mr. C. W. Freer's collection becomes fairly ludicrous, if, after all, merely a natural result of being an art museum *sans le savoir*. Justice Stafford's decision rests upon the clause in the charter which reads that the institution "shall have custody of works of art, the results of curious and foreign research." The decision was rendered apropos of the disposal of the late Harriet Lane Johnston's collections, which were to be deposited in the Corcoran Gallery, "until such time as there shall be established by the United States Government a national art gallery." A friendly suit on the part of the Smithsonian Institution brings out the fact that the national art gallery already exists. It is highly significant that this decision has been sought by the Smithsonian Institution, for it shows that its regents desire this power, and are prepared to meet considerable new responsibility.

That responsibility is a fairly serious one, involving as it does not merely the construction of suitable museum buildings, but also the gathering of an especial staff. It would be a misfortune to make a false start by rendering the art exhibits a mere extension of those in ethnology, and certainly there will be small incentive to leave works of art to the Smithsonian until one may be sure that they will be as well installed and as learnedly catalogued as the general scientific collections. All these considerations have, presumably, been weighed by the Regents, and one must expect in the near future the announcement of appointments which will give to the Smithsonian the confidence and prestige enjoyed by the art museums of New York and Boston. The advantages of a national museum of art at Washington need no argument. Perhaps no other American city has so many cultured residents, commanding leisure enough to enjoy such collections; certainly no other city has such a constant supply of tourists, both American and European. No place could be more appropriate for a great historical collection of American art, including contemporary examples, for Washington is happily removed from the immediate influences of the schools and studios. We trust the Smithsonian will make its own the project of an "American Luxembourg," upon which other museums have labored with only too little success. If a judicial attitude in this delicate matter of buying works of living artists can anywhere be attained, it surely should be at Washington.

Last week's decision of the British Court of Appeals should take the heart out of what little is left in the way of sincere opposition to the Education Bill. It upholds the principle that the local authorities cannot be compelled to pay for religious instruction in voluntary schools. Hence "Birreligion" is vindicated before it has finally been approved by the House of Lords. That Mr. Balfour's act of 1902 was carelessly drawn was known before the Court of Appeals judicially established the fact; this is merely another proof that the Conservative party, which so long arrogated to itself all constructive ability and statesmanship, could legislate quite as carelessly as any other great party. As to the value of the religious teaching, over which there has been such a terrible to-do, we have interesting testimony. In his last speech on the bill, Mr. Birrell told of a member of Parliament, three of whose daughters were educated in Board schools, and are confirmed and communicating members of the Church of England, while the two who went to Church schools are Dissenters, "stern, unbending Non-conformists." The Archbishop

of Canterbury, in stating that the voluntary teaching of religion is a farce in Board schools, quoted a lady, who wrote to him that in one school:

During the supposed Scripture time I found the headmistress of an infant school preparing in the central hall a selected number of children for some entertainment to the music of a Highland jig. This was distinctly heard in all the classrooms. In one the teacher was really trying to teach "There is a Green Hill." In another the religious instruction took the form of the children singing one hymn after another, while the teacher prepared the sewing.

Punch dismisses Mr. Birrell to his vacation in the following terms:

Go, then, to Sheringham, my Birrell, go,
And with your children pluck a playful leisure;
And, if at times your vacant thoughts should flow
To what you call your "Education" measure,
Thank Heaven, with solemn pauses,
No child of yours can come within its clauses.

One literary man in politics is making fully as fine a record as was expected of him. John Morley's recent address on the Indian Budget has been praised by political friends and foes alike—the *Spectator* even calling it "a speech which must rank among the great Indian speeches in our Parliamentary history." This is not merely because Mr. Morley clothed what could easily be a very dull subject with a rare charm, and drew an eloquent picture of India with its complexities, anomalies, and difficulties. He has begun a new policy, an era of reform which has as its aim the closer association of the people of India with their Government. Mr. Morley declared for this, and for freedom of the press and of speech, in clear and unmistakable terms, charged with unbounded faith and optimism. As a practical measure, he spoke of the possibility of increasing the number of natives in the Viceroy's Council, while reprobating his predecessor's method of partitioning Bengal as an attempt to break up the best educated of the Indian races. For these things and for Mr. Morley's general attitude of friendliness and helpfulness, the natives have every reason to be grateful, as they are reported to be.

A vexed question in the government of India was brought up by Keir Hardie, at the conclusion of Mr. Morley's speech, in a motion to place the salary of the Secretary of State for India on the estimates, for the purpose of giving additional opportunity for the ventilation of Indian affairs. Theoretically, every chance to discuss the fortunes of the millions upon millions of natives whose destinies are in English hands ought to be welcomed. The Secretary of State and the Viceroy have great powers, with but few checks upon them, precisely as with us the Secretary of War and the Insular Bureau may do about as they please in the government

of the Philippines; practically, they are in no way accountable to Congress. Mr. Morley opposed Mr. Hardie's motion, and in this he is sustained by the major portion of the English press. If Parliament is generally emptied on Indian budget days, this state of affairs is, at any rate, deemed preferable to lugging India into English politics. Hence the government of India will probably continue to be autocratic for years. As Sir Henry Fowler has said, since India cannot be really governed from England, the only thing the Liberals can do is to increase the opportunities of the natives to govern themselves. It would be idle to maintain that this compromise is satisfactory either to conscientious Englishmen or to the educated natives, who are more and more restive under foreign domination.

Professor Koch and his party, according to the latest reports in the Berlin *Tägliche Rundschau*, spent May and the first three weeks of June at Amani. This was in order to become acclimated and acquire some knowledge of African languages, while making a preliminary study of the sleeping sickness, the ravages of which are becoming more and more terrible. Including Dr. Koch, there are five physicians in the party; and a sixth, Dr. Meixner, will join them at Lake Victoria. As the region about the Victoria Nyanza is regarded as the focal point of the epidemic, the medical station is to be established at Muanza; but although Muanza is a military station, there are only six Europeans on the spot. Hence the Koch party will have to live in tents or huts. It is their intention to visit the various islands, most of which have been deserted by the natives on account of the sleeping sickness.

The Austrian Electoral Reform bill is finally in shape, and predictions of the complexion of the new lower house are in order. The number will be increased from 353 to 425 members. As before, the largest group will consist of Slavs, some 259 in number; the German groups will reach only a slightly smaller total, 233. The balance of the House will be drawn from nineteen Italian and five Wallachian districts. Since a matter of 81 Poles is certain to act independently of the Slavic plurality, the largest and most turbulent group is pretty well shorn of its power for obstruction. The German contingent also is far from homogeneous. On the whole, then, the new elections under liberalized suffrage will probably break up the old Parliamentary divisions along racial lines, and we may expect to see a general realignment of the Diet on the ground of sectional and political issues. It looks, then, as if the expedient of increasing the seats and broadening the suffrage basis will at least secure a new deal. On the other

hand, one can hardly imagine that an artificial redistribution of representation means the end of racial bitterness in Austria. If it did, such a mathematical forecast of the vote by races as given above, would be palpably absurd. At best, the Diet is temporarily insulated from its old griefs; the future will show whether the old German-Slav dispute is superseded or merely postponed.

Gen. Artamonof, who was in command at Vladivostok during the war, gave the military view of the Russian crisis to the St. Petersburg correspondent of the *Paris Figaro*. The veteran soldier shares the Czar's disgust with a Duma that is not "tractable," and that talks too much. What could one expect, he asked, from an ex-actor of the provinces inflating his lungs and bellowing as if he were in a cabaret and flown with vodka? As for a Ministry responsible to the Duma, the idea was preposterous. What guarantee could such a Ministry give of the rights of property, or what pledge that it would not be swept away entirely by the revolution? Certain reforms were necessary, to be sure, but they must come from the Czar. "the depositary of divine authority." Gen. Artamonof, when questioned as to the loyalty of the army, was evidently touched on a sore spot. Yes, it was true that the revolutionary propaganda had been at work among the troops. Even in Manchuria, the officers had known what it was to be stabbed in the back as well as volleyed at by the Japanese. But enough soldiers would remain true, the General thanked Heaven, to kill every mutineer. Throughout the interview, the belief was evident that the Duma had been got rid of once for all.

If the labor unions owned the factories in which they work, would they insist on an eight-hour day? There is a town in Spain in which 4,000 laborers have for the last six years been their own employers, but their hours of labor are eleven and a half a day! The name of this town is Cibara; it is a station on the railway line between San Sebastian and Bilbao. From time immemorial the manufacture of weapons has been its specialty. Of the 7,500 inhabitants, more than one-half belong to a socialistic union formed in 1900. The members collectively own their part of the town, paying rent sufficient to cover all costs, including taxes and repairs. The workshops for the ten or more inhabitants of each house are on the ground floor. Expert laborers earn about \$1.80 a day; beginners, and such of the women as are not engaged in domestic work, earn from 45 to 60 cents. Each member contributes 45 cents a week to the union; also a small sum to provide for the pensioning of the families of laborers who die.

ALL MUGWUMPS NOW.

In the very chaos of politics in New York State, at present, a wholesome truth is gaining general acknowledgment. This is that independent voting has come to stay. And it is preparing to display its power on a scale as great as that of last year. After the crashing political revolutions of 1905, in Pennsylvania and Ohio, as well as in the city of New York and other municipalities, there was a great deal of talk about the American citizen having turned independent in politics, but the politicians did not really believe it. They sat down to wait for the flood to subside. But it is still running high. And the spirit of independence is showing a strong tendency, not only to vote as it pleases, regardless of party names, but to nominate as it pleases, ignoring party machines and packed conventions. The race for the Governorship in New York is practically, to-day, free for all. Hearst is to nominate himself, as he is entitled to do, if he chooses. It is expected that Mr. Jerome will soon announce his candidacy, which the parties may take or leave, but which will be a fixed thing, in any event. Such contempt for "regularity," with such open defiance of machines and bosses, has not before been seen in our political life.

It is a revival or expansion of pure Mugwumpery that we are witnessing. The thing which was anathema but a score of years ago, has at last become the model of true patriotism. It is easy now, even popular, to scorn being taken in by party labels, and to go where convictions carry; but in 1884, how hard it was! If it had only been an act then to win newspaper applause, it would not have been necessary for Roosevelt and Lodge to discover "the larger good" in eating their own words. Nor would there have been such tears and wails about the crime of abandoning the "greatest party, sir, that ever existed"—the very machine which now Mayor Weaver of Philadelphia is lauded to the skies for smashing, and which decent Republicans in this State are exhorted to abhor and crush. Of a truth, the despised Mugwump has refused to stay in that grave to which the practical politicians doomed him, and in these last years of grace has achieved his greatest triumph—that of having his teachings hailed as the gospel of deliverance even by his former enemies.

All this is a terrible shock not only to the party bosses, but to their academic and philosophical defenders. Where now is all that delicious literature issuing from the very colleges, a few years ago, to teach us that it was idle to denounce and attack bosses like Flatt and Quay, since they always had existed and always would exist? Where are those superior preachers of the gospel of things as they are, who explained

to us that the true course was to break-fast with the boss, and appoint his creatures to office? In some directions, this philosophy of practical politics achieved notable success. It proved admirably fitted to reformers with an itching for office; it suited also the needs of the bosses. Statesmen with a taste for writing made it the theme of many charming essays, in which they recounted their own skill in getting and keeping office, and challenged the Mugwumps to show a similar record. Even a man of Senator Hoar's calibre had to cast his stone at the misguided men who had sought reform outside of the party, and had thereby doomed themselves to political oblivion.

But the despised Mugwump simply kept on preaching righteousness. In the face of ridicule and hate, he went on maintaining that parties are simply means to an end; that if they become so corrupt as to defeat that end, it is the act of a fool to cling to them; that the way to reform them is to vote against them. All can raise these flowers now, for all have got the seed—but it was seed first sown by the Mugwumps. The main thing, however, is not the question who were the pioneers, but how to make the best use of this large liberty into which we have been led. One thing is certain. The people will not be so easily deceived again. They have their eyes fixed on political realities. Party is but an instrument, not a fetich; a boss is but another name for a usurper; no nomination is a certificate of election; the conscience voter is the man who decides. With these articles of the Mugwump creed now recited by hundreds of thousands, it will be long before the people fall down and worship the old political idols again.

NATIONAL DETERIORATION.

Race degeneracy, which is sharing the honors with race suicide, is the subject of the latest of the Drapers' Company Research Memoirs (Dulau & Co., London). Under the title, "Studies in National Deterioration," David Heron of St. Andrews University and University College, London, presents interesting statistics on the relation of fertility in man to social status, and on the changes in this relation in the last fifty years. Much of the talk about race degeneracy and suicide with which we have recently been regaled has been based upon mere guesswork, or, at best, upon figures from which it is unsafe to generalize freely. Mr. Heron's investigation, however, brings out facts more striking than those collected by the secretaries of college classes. He sets out to find, for certain districts of London, the answer to two questions:

(1.) To what degree is the reduced fertility of English wives associated with social status, or with conditions which mark

poverty, disease, or generally unhealthy and improvident surroundings?

(2.) Further, if it be possible to show marked relationships between size of family and social conditions, can it be shown that these relationships have changed, and if so, changed for the better or worse, during the last fifty years?

The answer to the first question is, as we might expect, that "in those districts where the professional classes are most numerous and where many domestic servants are kept, the married women have fewest children." Culture, education, leisure, comfort, and providence mean a diminished birth-rate. On the other hand, in districts where there is overcrowding, where there is a superabundance of the lowest type of labor, where infant mortality is greatest, where drunkenness, immorality, and tuberculosis are prevalent, and where pauper lunatics are plentiful, the birth-rate is high. Mr. Heron admits that the earlier marriages of the less educated, less prosperous, and physically feeble portion of the community "have something to do with the higher birth-rate," but, according to his tables, these earlier marriages "do not account for it to the extent of at least 50 per cent." To such an extent, he maintains, "a lesser absolute fertility, a lessened exercise of fertility, or a deliberate restraint of fertility must exist in the classes of the higher social status to account for the observed facts."

Moreover, the argument that excessive fecundity in the haunts of disease and crime is corrected by excessive mortality, is—at least for these districts of London—destroyed by Mr. Heron's researches. In spite of the necessary subtractions for the higher death-rate, the net fertility of the lower stratum, he discovers, remains higher than that of the superior; and the lower would seem to be gaining steadily upon the higher.

The natural comment on these figures is that always and everywhere the poor have been noted for large families; and that, nevertheless, the world has managed to muddle along. At this point Mr. Heron comes in with the answer to his second question:

The causes which lead the poorer stocks of the community to reproduce at a greater rate than the better stocks have increased in effect during the last fifty years by nearly 100 per cent.

Furthermore, in 1851 the districts with the lowest infantile death-rate were those where women had many children; in 1901 the condition is exactly the reverse. In 1851 the higher birth-rate of the lower classes could, in the opinion of Mr. Heron, be accounted for by the relatively earlier marriages; in 1901 other causes are at work. He believes, therefore, that he has pointed out "distinct sources of national deterioration which the statesman and social reformer

must be prepared to consider, and consider quickly."

The case is, however, far from complete; the figures apply only to London. There may be countervailing tendencies in other British cities; probably the rural districts of Great Britain and Ireland also tell a different story. For several centuries alarmists have feared that the incessant recruiting of city from country would exhaust the yeomanry; and yet the process bids fair to continue forever. Here may be one of the unreckoned factors in the product; this transfusion of blood, which the statistician has such difficulty in tracing, may be one of the things which preserve the vitality of the British stock. Again, fifty years are too brief a period for a sane generalization in matters of this sort. Improved sanitation, the tearing out of crowded tenements, the crusade against tuberculosis and other maladies, the extending use of pasteurized milk, the numberless enterprises of organized charity—all these movements may change the face of the returns in the course of the next hundred years. Evidently, then, the English statesman and social reformer should accumulate further data before invoking medical science to check reproduction among paupers and criminals, and offering prizes for every babe born of the well-to-do.

Still less is there occasion for our own fluent speakers on the problems of hearth and home to redouble their eloquence. We have no desire to minimize the sickness, misery, and sin in our overcrowded cities; we make no apology for the provoking slowness of our college graduates in marrying and begetting children. But we remind our readers that there is no land on earth where the transition from the so-called lower classes to the middle and the higher is easier and more frequent. Through the agency of public schools and the organization of our democratic society, the stronger and more intelligent boys and girls, though born in most unfavorable surroundings, are unceasingly forcing their way upward. The progress from abject and biting poverty to comfort is often a matter of only one or two generations.

Then, too, our good old American stock—as we ironically call it—is being daily reinvigorated by immigration. Some of our immigrants are, to be sure, rather unprepossessing at first glance, but every European race has proved itself a desirable addition to our population. The people who are now chattering so volubly about the ruin of America by the "influx from Southern Europe," have short memories. Men of fifty can recall the day when the influx from Northern Europe was equally appalling to timorous souls. Rural Protestants of New England and New York used to point to the Irish Catholics, our

hewers of wood and drawers of water, as the very mudsills of civilization; but no one complains that the Irish of the second and third generation are not contributing their share toward our advance in commerce and the professions. The German-Jew pack-peddler was once our type of a man without a country; but his children and grandchildren are our captains of industry, leaders in finance, scholars, and teachers, preachers of righteousness, founders, and sustainers of noble charities. The Italian, in even less time, has displayed such industry and capacity that the South is competing with the North, the West with the East, in offering him inducements to settle. The gloomiest predictions continue unfulfilled. If the race be really dying at the top, there are plenty of fresh and lusty shoots to repair the loss.

BANK LOOTERS AND EXAMINERS.

We imagine that the first question asked by most people, on reading the account of the wrecking of the Milwaukee Avenue State Bank of Chicago by its president, was what the bank examiner had been doing during the half-dozen years in which the thefts have been going on. Promptly, after the bank had become hopelessly insolvent, and its guilty officers had fled, the agents of the State Banking Department took charge of the situation, and proceeded to overhaul the bank's accounts with a zeal which would have had some practical value if applied a few years earlier. Yet the subsequent revelations show the president's frauds to have been of the most transparent nature. Use of fictitious names, or of names of obscure people, on loans through which the money was abstracted, is one of the oldest and stupidest devices of bank defalcation. One immediate discovery was that the bank's accounts were short some \$250,000 at the beginning of 1901. They are short more than a million now, a sum which represents one-fourth of the entire fund entrusted to the bank by depositors. That these depositors were for the most part ignorant working people of scanty means, will no doubt increase popular indignation at the crime of Stensland and his accomplices. But the well-to-do depositor in other institutions is as little protected as the Chicago victims, so long as lax or imperfect methods of examination are allowed to prevail. The question is one which concerns every man with a bank account.

The familiar answer made by delinquent examiners, in cases of this sort, is that bank bookkeeping is so complex a science that a rascal with ingenuity enough to manipulate the books can conceal his peculations in such a way as to baffle the most alert outside investigation. This is sometimes true,

but not, we are confident, in the majority of instances; certainly not in this one. The further excuse to which the self-excusing examiner retreats, when it is proved that he ought to have discovered the fraud, is the familiar apology of our Kilburns and Hendrickses, that proper examination would involve too much time and labor to be practicable.

It has never seemed to us that this is an excuse which should be accepted. The Banking Department and its bank examiners occupy a well-defined position towards the public. The opening of an institution's books and vaults to the frequent supervision of the experts appointed by the State is a condition of granting the bank its charter. Confering of the grave responsibility of receiving the public's savings, and investing them in the money market for the profit of an institution's shareholders, involves necessarily a constant and searching watch, by officers acting in the public's interest, over the manner in which these savings are used. The fact of such constant examinations by the State is an element of no slight importance in the confidence of the public in its banks. This being so, a general assertion that the bank examiner is incapable of unearthing any but the most superficial and obvious frauds, amounts to confession of incapacity. A Banking Department which can do no more than that is pretty nearly useless for the very purpose which led to its creation—as useless for any public good, let us say, as the New York Insurance Department was, during the years when Wall Street promoters and underwriting syndicates plunged their arms to the elbow in the life-company surpluses.

In the case of the Insurance Department, it is now admitted that the officers did not perform their duty, and did not attempt to perform it. The same motives which led to this laxity on the part of Mr. Hendricks—amiably believed that good men can do no wrong, dislike to the making of inquiries which annoy bank officers—repeatedly led to laxity among bank examiners. It is high time these departments were held to a more rigid accountability. If they can prove that, in a given community, their force is inadequate to decent protection of the depositors' money, then let their force be reorganized. It was the demand of conservatively managed banks themselves which led, a few years ago, to the quiet reorganization of the national bank examiners' force, with excellent results. But the initiative in such reform obviously should not be left to banks. The party most deeply interested, the public with its savings, happens also to be the party which has the power to insist on proper State supervision.

It hardly need be added that the duty of thorough and careful examinations by the banking departments, especially in the case of small institutions like Stens-

land's Milwaukee Avenue bank, is particularly urgent at the present time. The country has for six years been living in an atmosphere of speculation. We have had repeatedly, from financial circles where conservatism was once thought to prevail, what amounted to public assurances that speculation for the rise in stocks was sure of success. Following this, a body of reckless millionaires, descending upon Wall Street, have devoted their fortunes and energies to precisely such Stock Exchange manipulation as might convince the doubting outsider that the time to double his money overnight had arrived. In the face of such a situation, accompanied as it has lately been, over the whole country, by the real estate speculation into which Stensland flung the proceeds of his defalcations, redoubled vigilance on the part of supervising public officers, in scrutinizing the use of funds by bank officials, is imperative. It is a fact which ought not to be forgotten, that watchful inspection will be even more useful in preventing such frauds than in unearthing them after they have been committed. Belief in the laxity or incompetence of the banking department has been a powerful motive in nearly every scheme to gut a bank. Meanwhile, the people have wholly failed to get the protection for which they are paying.

THE ELECTRIC LIGHT OF HISTORY.

That newspapers, in dealing with the course of events in Russia, should be tempted into drawing parallels between the revolution there in progress and the upheaval of 1789 in France, is natural. It makes the treatment picturesque and, as near as may be, scientific. But, while it would be unwise to refuse to be guided by the traditional lamp of experience, one should see to it that the light employed is an honest, steady-going affair, good for some hours of study. There is danger in switching on the electric bulb for five minutes, and formulating historic truths while the presses wait.

Of this peril, an illustration is afforded by the *New York Times*, which has devoted a great deal of attention to the Russian movement. Its editorial comment shows, however, that it has French Revolutionary parallelitis in a very acute form. The attack began with the first announcement of the date set for the convocation of the Duma—May 10th, the date of the meeting of the French States-General, as a Russian professor is said to have pointed out. Here was a whacking coincidence to start with. Of course, it is possible that if the Duma had met in July, it might have coincided with the date of the storming of the Bastille, or if in August, with the pillage of the Tuileries, or if in September, with the abolition of the French monarchy, or if in January, with the execution of Louis XVI.; yet, when

all is said, there was that absolute synchronism; and, without being superstitious, one might predict for the body which met at the Tauride Palace on May 10, 1906, a fate similar to that of the body which met at Versailles on May 10, 1789. The newspaper in question seems obsessed by this coincidence, which reappears in its columns from time to time. The only valid objection is that the States-General met at Versailles on May 5.

Another instance is connected with the rumor, circulated some time ago, of an understanding among the Russian, German, and Austrian Emperors for foreign intervention in Russia, in case the revolution gained the upper hand. Of this the learned newspaper wrote with conviction:

As for the bearing which a German and Austrian invasion of Russia might have on the fate of Nicholas II., it is writ large in the sanguinary history of the French Revolution. Scarcely, in 1792, had the Prussians forced their way into France than the truculent convention decreed the abolition of royalty and proclaimed the republic, and exactly four months thereafter Louis XVI. was put to death.

And then it went on to say: "Its [Russia's] vast distances have proved in the past, and may prove again, fatal to invaders."

Now, as a matter of fact, nations in the past have intervened with success for the suppression of revolutionary movements in foreign countries, as France did in Spain in 1823, as Austria did in Italy repeatedly, and as Russia herself did in Hungary in 1848. Vast distances may have destroyed Charles XII. and Napoleon, but there are railroads now, and there is telegraphy. And as for stout old Generals January and February, we know that Japan conquered Manchuria at some 10 degrees below zero. But a really better answer than all of these is supplied in the following comment from the same newspaper of an earlier date: "It is, in fine, beyond a doubt that, under existing conditions inside and outside of Russia, William II. would be able, if he chose, to prop up with German bayonets his cousin's wabbling throne."

What renders this rapid collation of history dangerous, aside from the possible misapplication of past facts, is the untrustworthiness of the contemporary "facts" which we must employ in making our comparison. Out of many examples that might be adduced, we cite the prevalent conception of the character of the peasant Deputies in the Duma. When that body met, the newspapers gave space to one picturesque account of a scheme on the part of the Government to provide cots for the accommodation of the peasants within the precincts of the Tauride Palace, so as to isolate them from seditious influences. It was almost implied that such an ar-

angement would appeal to the primitive tastes of the *mujik* Deputies, in affording them a means of escape from the oppressive ceremonial of hotel life, and enabling them to go to bed with their boots on, as they probably did at home. To the man in the street, the peasant representatives were a horde of Slavic Cincinnatuses who left the plough for the Tauride Palace, and brought the odor of the farm with them. But a photograph of the peasant group in the Duma, which has been repeatedly reproduced in the press and the magazines during the past few weeks, should tend considerably to modify this general impression. Keeping in mind that Europeans do not dress so well as we do, and as a rule do not shave, we should not be greatly to blame if we identified the picture as that of a group of, say, German professional men, with here and there an incongruous figure. And, as a matter of fact, we have learned of late that these "peasants" have worked little with their hands, and that practically all are men of solid education.

Under such circumstances, it is extremely dangerous to draw hasty historical comparisons. Montesquieu, of course, possessed the power of deducing the correct generalization from the wrong data; and we, too, may indulge in historical parallels, even though they are a bit bold. But it is well to remember that some of these parallels, as the Irishman said, may turn out to be less parallel than others.

A LAWYER BEHIND THE TIMES.

Our modern "business" lawyers who can condescend to "suthin' in the pastoral line" may find good reading in "Jottings of an Old Solicitor," by Sir John Hollams. Sir John has run a distinguished and successful course in what still passes in England for the minor branch of practice, although on both sides the water it is ordinarily more lucrative than pleading. Coming to London without a friend, marrying at twenty-four, Hollams soon came into professional prominence. While in the thirties he was offered, but declined, the appointment of Solicitor to the Admiralty; in 1867 he was the only solicitor named for the Judicature Commission, which did so much to reform the procedure of the British courts. Serving subsequently in Royal Commissions on the usages of the Stock Exchange, on the business of the courts, and of the Treasury, he was also of that famous committee of 1894, which, under Lord Chancellor Herschell's presidency, found the basis for the present Joint Stock Companies' Act.

Now, we ask an American business lawyer of the new school to imagine the sources of Sir John's modest fortune. Remember that here was a practising lawyer who not only knew, but had

largely made the business ways of "the City," had drawn a national act of incorporation, had officially investigated Lombard Street. Why, the greenest lawyer's clerk in New York could tell you that such a man had been "next to" all the "good things." The legal fancy whirls when one thinks of the stock bonuses, tidy underwritings, free memberships in pools that were willingly at his disposal. A law-office in this city has been commended because "every great interest is represented in it." In a sense, this was true of Mr. Hollams's office, but with what a deplorable difference. For here we have to exhibit the depressing, the eminently British, spectacle of a prosperous solicitor who stuck strictly to his profession and cared for none of these high-financial things.

Writing with a cheerful, but to the professional mind most irritating, obliviousness to lost opportunities, Sir John says of what most of his American colleagues must regard as a hopelessly mis-spent life:

I devoted the whole of my time to my profession—never speculated or sought to make money in any other way. I never applied for a share in any company, and have never sold any investment I had once acquired. With very few trifling exceptions I have never lent money at interest, either with or without security. With one trifling exception I have never been surety for anyone, and have never acted in the promotion of a company except professionally.

Sir John has the grace to make perfunctory apologies, but actually defends his unenterprising course on utilitarian grounds. He writes, in terms which the office-boys in the financial district could refute:

All this doubtless sounds very selfish, but it had the advantage of enabling me to devote my time and thoughts to the professional work I had in hand, and this has doubtless to a great extent contributed to such professional prosperity as I have had.

Such confessions will arouse intense sympathy on this side the water, because Sir John was evidently a young lawyer of promise, and capable of better things. There is no doubt, for example, that he would have been fully competent to peddle at a profit promoters' stock that had cost him nothing; he could presumably have affixed a valid and legible signature to an underwriting contract. Can one doubt that his advice would have been properly appreciated in sterling by a Hooley or a Whitaker Wright? He was in large affairs, and could sagaciously have manipulated a "yellow-dog fund" to the satisfaction of its founders. What barred the way to these larger and more inspiring activities—something in the man or some fatal defect in his environment?

We feel we must absolve the environ-

ment. The higher ranges of business law are not unpractised in England, even though an up-to-date American office could give the British odds in incidental ways of making the business pay. Even in England, we repeat, Sir John might have done much better than he did. The shortcomings of his career are personal, not racial. He and his entertaining book are monumental illustrations of a hopeless, if quite respectable, old-fogeyism, which, if commoner in Great Britain than elsewhere, is vanishing even there.

The monumental unconsciousness of such oak-ribbed characters is immensely mirth-giving to more versatile minds, and we take leave of Sir John in a comical passage, in which he not only looks back complacently over his old-fashioned career, but presumes to set his example before the youthful practitioners of the twentieth century. Only hear him go on:

Thus I have indeed much to be thankful for. I have received numberless kindnesses from judges, counsel, and solicitors, as well as from clients. I have never had a serious personal difference with any one, and have never been a party to a lawsuit. I may be said to have been fortunate, but I believe that the road to such success as I have had is open to any young man entering the profession who may choose to follow it, and devote himself to legitimate professional work, and abstain from money-lending, company promoting, financing builders, and speculative business, and give constant, careful, and anxious thought and attention to the professional business from time to time entrusted to him.

We will not dignify this argument by referring it to our legal readers. Such reasoning in this enlightened age will not go down even with our elevator men.

PARIS LITERARY NOTES.

PARIS, August 3.

There was never so swelling a tide of posthumous glory in classic literature as that of the Sonnet of Arvers. An author is a "classic" when his work gets into school "classes" as a standard or model; and such has been the fate of this sonnet for generations of French students of literature. It is the flowing utterance, impeccable in form and language and gently pensive in mood, of some cultivated youth in the first person singular, whose "life has its secret and his soul its mystery." The following thirteen lines explain melodiously that the secret and mystery are his love for a lady who knows it not. Remember that this was written in the self-expansive prime of Romanticism; but none of the generations learning the lines by heart knew who the hero was or who the lady, of if there was a sequel.

Now, nearly a hundred years later, we have reached the higher criticism. It has ferreted out the christening record of Arvers—classically uninominal forever more—and discovered that he wrote the sonnet in his twenties in the album (Ro-

mantic word that) of Charles Nodier's daughter. As she placidly wrote an answering sonnet on the next page, she can scarcely have recognized herself in the lady of Arvers. Concerning this, the neo-criticism differs and discusses, several doctors insisting on anecdotal testimony that the veritable lady was Madame Victor Hugo, whose *salon* the young Arvers also frequented. The uncritical think she is nothing more than that very common article—the lady of a young man's first verses.

It is now discovered that Arvers kept on versifying in print, but literature knew him no more, and he died years afterward, the type of a comfortable *bourgeois*. For once a lady's album induced inspiration in what had otherwise been a blockhead like the immense majority of us. The higher criticism has led to this—a tablet on the outer wall of the house where Arvers lived in old Paris; fourteen new sonnets of a young poet, all keeping the same rhymes and order as the sonnet of French sonnets; and this *tour de force* will doubtless be followed up by a bulky thesis for the University doctorate of letters constituting the final corpus of Arvers critical learning. And in French classical literature indefinite generations of scholars will go on learning by heart (they have not yet the ugly and distorted scholastic word "to memorize") this sonnet which is greater than its author.

One whom glory never reached living or dead now rises up in the constantly increasing fame, after three hundred years, of a brother. It is Antoine, the third of the Corneilles, who wrote good verses heralding the golden age of Louis the Fourteenth. The second Corneille, Thomas, was even a more voluminous writer than the great Pierre, and all lovers of literature know of his existence without having read his defunct works. The elder Dumas once received the visit of an obscure Dumas who had at last had a play acted. "Henceforth France will speak of the two Dumas as she does of the two Corneilles," said the proud author. The giant turned good-naturedly with an "*Au revoir*, Thomas!"

Antoine Corneille was not even spoken of at his brother's centenary, but within the two months since some literary scholar (scholarship now meaning lucky finds in old papers or decaying books in the morgues of the past) has found his history—and his verses. They are not even half-bad, curiously intermingling the stock classical allusions with the simple traits of daily life long before Charlotte cut bread and butter in Werther's high romance or Wordsworth introduced a little girl's porringer into the tragedy of death.

He was a parish priest and drew modest revenues as an *abbé* from a benefice that came to him somehow—not apparently from any political influence of his brothers at the court. His verses show a good deal of piety, of the George Herbert kind, and declare their composition by a village *curé* walking to and fro in trim garden paths, with the smell of thyme and other soup savories in the evening air, while the Seine glistens through the trees.

Piety ran in the family down to the generation of Charlotte Corday—great-grand-niece of Pierre, Thomas, and Antoine—when it leaped into fierce patriotism, to flicker out in our own day in middle-class memories of family glories of the past. The

translation into Alexandrines of "The Imitation of Christ" by the great Cornille has just been made the *pièce de résistance* of Joseph Fabre's "lay" edition and commentary on monkish Thomas à Kempis, wherein the irreligion of the future joins hands with the religion of the past.

A controversy that interests, if it does not concern, Americans is threshed about in a volume on "Sainte-Beuve et Chateaubriand," by Abbé Bertrin. The author is a young priest, who created a sensation by his university thesis in letters at the Sorbonne, in which he vigorously attacked Sainte-Beuve for bringing the sincerity of Chateaubriand, religious or literary, into question. The essential veracity of his tales of travel in America was particularly examined. This called out what was supposed to be a crushing reply from M. Bédier, who has succeeded Gaston Paris as professor at the Collège de France. Besides the impossibilities of the narrative—we always knew that even a distinguished Frenchman could not hear the roar of Niagara from Rochester—extensive copying was traced from the Jesuit Père Charlevoix, who wrote a century before. Since then an inconvenient diary of Chateaubriand's valet, written during the famous itinerary through Greece and Jerusalem, has shown that the literary conscience of Sainte-Beuve was, to say the least, quite absent from the elder writer's literature. Abbé Bertrin now reenters the lists, undaunted, documented, and with a vehemence which must astonish noiseless Professor Bédier among his books. Carlyle, Newman, and Mr. Goldwin Smith have in English differed as to veracity and sincerity, both absolutely and mutually.

The circle which centred in Madame Récamier, to which Chateaubriand belonged until his death, but from which Sainte-Beuve escaped or was expelled, will be a fruitful subject of university theses for years to come. One of its most interesting members, the Duc Mathieu de Montmorency, who was so mixed up with the sentimental life of Madame de Staël, won the lucky number in the lottery which Chateaubriand made of his house in the delightful and mysterious Vallée-aux-Loups near Paris. There had been written the work which threw Chateaubriand's influence into the Catholic revival—"Le Génie du Christianisme"—just as the Oxford movement came from Walter Scott. Montmorency left the house—a veritable château—to his grandson, the Duc de Doudeauville, whose son in turn dispenses in it a hospitality redolent of the past near by the retreat of Sully-Prudhomme, most modern of philosophic poets. And from the hill above floats the sound of Latin Quarter revelry in its favorite suburban resort of Robinson. It is classic ground—all of it—and France alone among modern nations triturates her classics.

S. D.

Correspondence.

JAMES DE MILLE.

TO THE EDITOR OF THE NATION:

SIR: The reprint, in its original form, of De Mille's "Cord and Creese" may excuse me for calling attention to a man whose more solid qualities have never been fully appreciated. To have produced thirty books

of fiction in a little over ten years, even though most of the books were mediocre in quality, was a notable enough achievement. James De Mille, the Canadian novelist, did this, and did it under conditions that make the result still more extraordinary. His books were all written and published while he filled the important chair of history and rhetoric at Dalhousie College, Halifax, 1865-1880, and kept abreast of his college work. One may venture to say that if some of his stories were reproduced today, in a modern dress, the language slightly remodelled to tickle the intellectual palate of the hour, and with, say, marginal illustrations, and that sort of thing, they would create quite a momentary sensation. As a matter of fact, old-fashioned as they unquestionably are in tone and treatment, and outward dressing, they still appeal to a wide circle of readers. I have been at some pains to verify this, and find that De Mille's novels are not only on the shelves of a great many American, Canadian, and English public libraries, but are in considerable demand; I have also found them in private collections all over America. Not long ago, wishing to complete my own set, I wrote to a large New York dealer in second-hand books, and after some difficulty secured two or three of the missing volumes, at what seemed to be rather stiff prices. The dealer assured me that he could always command a good price for any of De Mille's novels; that they were constantly being sought for public and private libraries, and that any which turned up at auction sales were snapped up at once.

Far and away the best of De Mille's novels is "Helena's Household," a tale of Rome in the first century. This was one of the first books he wrote, and it was the only one of his novels for which he really had leisure. He had resigned from the faculty of Acadia College, and was taking a year's rest before assuming his new duties at Dalhousie. Some of these months were devoted to the writing of "Helena's Household." He had already prepared himself very carefully for the work, not only by soaking himself in the literature of the period, but also by a six months' visit to Rome, where he could reconstruct the scene of his story on the spot. How successful he was in reproducing the life and atmosphere of Rome in the first century, every reader of "Helena's Household" will bear witness. And yet the book as we have it is but an emasculated version of the original novel. De Mille had difficulty in finding a publisher, and when he did at last succeed, his publisher insisted on the re-writing of certain chapters which he did not consider would prove palatable to the theological thought of the day, however true they might be historically. De Mille fought against this for a time, but finding that there was no other way of getting the story into print, finally surrendered. He was so disgusted, however, with the outcome, that he made up his mind never again to attempt a serious novel. Curiously enough, although all the intervening novels were light in character, with no more serious object than to entertain the reader, the very last one he wrote, published eight years after his death—"A Strange Manuscript found in a Copper Cylinder"—foreshadowed a return to his more serious

mood. Despite the surface gayety of this curious story, there is a serious undercurrent that appeals to the student of modern problems of living. Had James De Mille lived a few years longer—he died at the comparatively early age of forty-four—there is little doubt that he would have written novels worthy to stand beside the best product of his generation. He had the equipment. He was a thinker; he had read widely, and absorbed what he read; he had the indispensable insight into human nature and a keen appreciation of the humorous side of things; above all, he possessed imagination.

Quite apart from what he accomplished, or might have accomplished, in fiction, James De Mille deserves to be remembered as a man of brilliant parts, and most lovable personality. His students idolized him, and dedicated an alcove in the college library to his memory. He was a most charming companion, a genial and entertaining talker among his friends, a musician, and also an artist of more than ordinary skill, and a remarkable linguist. He both read and spoke all the leading languages of Europe, except Russian. He was thoroughly familiar with Latin, Greek, and Hebrew, and had a good working knowledge of Arabic and Sanskrit. He had wandered into every road and byway of English literature, and enriched a text-book on rhetoric, which he prepared, with such a wealth of illustrative passages from the English classics as will hardly be found elsewhere.

De Mille never deceived himself as to the real value of his books. He referred to them, with one or two exceptions, as mere "pot-boilers," but looked forward to that period of leisure, which never came, when he hoped to produce the best that was in him. Like other prophets, he was not without honor save in his own country. The people of Halifax did not recognize his existence, until Mrs. Scott Siddons, on a visit to the town, selected passages from "The Dodge Club" for a public reading, and spoke enthusiastically in praise of the book. Brown University was De Mille's alma mater. A few years before he died he visited the college, and was inexpressibly touched by the enthusiastic welcome he got from the faculty and students.

LAWRENCE J. BURPEE.

Ottawa, August 10.

VOLTAIRE'S FAITH.

TO THE EDITOR OF THE NATION:

SIR: In a recent number of the *Nation* I read, in an admirable and interesting review of the life of Voltaire, this remarkable statement:

But then, side by side with this buffoonery, we can place Voltaire's one solemn statement of his belief, written in a firm hand, at what he believed to be his last hour: "I die adoring God, loving my friends, not hating my enemies, and detesting superstition. February 28, 1778. Voltaire."

Where did your reviewer get his information? The facts are pretty clearly established. In February, 1778, he, being then eighty-four, came back to Paris, after twenty-eight years' absence. A fortnight after his arrival he became seriously ill, and a confessor was sent for. The Abbé

Gaultier came and officiated. Voltaire recovered, but about the middle of May he relapsed, and on the 30th of the month his condition became so serious that the priests were again summoned. This time his nephew, the Abbé Mignot, the Abbé Gaultier, and the parish priest, the curé of St. Sulpice, were present. Voltaire had been suffering great agony from strangury, and had been taking an opiate in large doses, and when they arrived he was in a state of half insensibility. When the curé aroused him and asked him formally to subscribe to the doctrine of the divinity of Jesus Christ he motioned the priests away, and, according to La Harpe, murmured "Laissez moi mourir en paix." He then sank into a comatose condition which lasted till death. There is no foundation for the stories that he died raving and calling for a priest, other than a vague and ambiguous statement by his physician, Tronchin, who was not present. La Harpe's account of the death is the most trustworthy one, and is followed by the Marquis de Condorcet in his "Life of Voltaire," published in 1791, and by all fair-minded modern writers. George Saintshury, in his article in the "Encyclopædia Britannica," while deprecating the fact, confirms La Harpe's statement.

SILAS ORRIN HOWES.

Galveston, Tex., August 5.

[As the reviewer of Tallentyre's "Life of Voltaire" resides in Oxford, England, we have not waited to get his exact authority for the sentence quoted. Voltaire was not a Christian, but an avowed Deist, and the sentence certainly expresses the creed, though not always the acts (he hated a good many enemies), of his whole life.—ED. NATION.]

SYMPATHY FOR ANIMALS.

TO THE EDITOR OF THE NATION:

SIR: Your correspondent, who writes of "Jewish Sympathy for Animals," may be interested to note that as far back as Philo Judæus the same question was raised, and debated with identical arguments. "The sycophants charge us with misanthropy," says, in substance, Philo ("De Caritate," 18). "But on the contrary the spirit of philanthropy in our legislation extends itself even to beasts that lack discourse of reason." In addition to the illustrations given by your correspondent, he cites the prohibition against yoking the ox with the ass lest the stronger brute should force the pace on the weaker member of the union. The general reason he assigns for all such legislation is the preservation of the spirit of pity, "the most natural and necessary sentiment of a rational soul." The Jewish legislator, he says, cries to all who have ears in their souls that we have no right to wrong any creature of a different species from us merely because it is different.

PAUL SHOREY.

University of Chicago, August 10.

Notes.

Thomas Y. Crowell & Co. will soon have ready a book on "Great Riches," by Pres-

ident Eliot, and "Famous Actor Families of America," by Montrose J. Moses.

Little, Brown & Co. will issue this autumn a "Handbook of Polar Discoveries" by Gen. A. W. Greely, the Arctic explorer, and for many years chief signal officer of the United States army.

The Morgan Shepard Company, which has transferred its home from San Francisco to New York, announces the following books: "The Diary of a 49er," edited by C. L. Canfield; "Henrik Ihsen," by Haldane Macfall; "On the Giving of Gifts," by Margaret Collier Graham, and "Lions," by James Simpson.

Early in the year the *Nation* printed a long account of Fogazzaro's "Il Santo," which both for artistic and religious reasons has created a good deal of noise in Italy. The book has now been translated into English, as "The Saint," by Agnetti Pritchard, and published, with William Roscoe Thayer's Introduction, by G. P. Putnam's Sons.

The autumn publications of Henry Holt & Co. will include: "The Bird," by C. Wm. Beebe; "The Log of the Sun," by C. Wm. Beebe; "A Cheerful Year Book," by F. M. Knowles and C. F. Lester; "The Friendly Town," by E. V. Lucas; "Maine's Ancient Law," a new edition with introduction and notes by Sir Frederick Pollock; "Doyle's English Colonies in America," vols. iii. and iv.; "Affairs of State," by Burton E. Stevenson; "Joseph Vance," by Wm. De Morgan; "The Ulswaters," by Arthur Colton; "In the Shadow of the Lord," by Mrs. Hugh Fraser; "The King's Divinity," by Dolores M. Bacon; "Felix Gwyne," by Mary Moss; "Casa Granda," by Chas. D. Stuart; "Daddy's Daughter's," by Marion A. Taggart.

A. C. McClurg & Co. have several Italian books in their autumn list. Egerton R. Williams, jr., author of "Hill Towns of Italy," has written an Italian romance of the fourteenth century, called "Ridolfo: The Coming of the Dawn." A more important work is Molmenti's "History of Venice," which has been translated by Horatio F. Brown. "With Byron in Italy" is a companion volume to "With Shelly in Italy" and "Florence in the Poetry of the Brownings." It is edited by Mrs. Anna Benneson McMahan. To these works may be added an historical edition of "Romola," in two volumes, with 160 engravings. It is to be edited, with an introduction and notes, by Dr. Guido Biagi, librarian of the Laurentian and the Riccardi libraries in Florence.

The autumn announcements of the Macmillan Co. include novels by Jack London, Marion Crawford, Charles Egbert Craddock, Pierre Loti, E. V. Lucas, and R. Lawrence Donne. In history and biography they have the following: The completion of the "History of the United States," in seven volumes, by James Ford Rhodes; the second volume of Edward Channing's more popular work; the fifth volume of Herbert Paul's "History of Modern England"; the first volume of "A History of Rome in the Middle Ages," by F. Marion Crawford and Prof. Giuseppe Tomassetti; volume four of the Cambridge Modern History, dealing with the Thirty Years' War; the "Reminiscences of Sir Henry Irving," in two substantial and richly illus-

trated volumes, by the late actor's manager and friend, Bram Stoker, and the "Life, Letters, and Art of Lord Leighton," also in two volumes, by Mrs. Russell Barrington. The complete poems of W. B. Yeats will be issued in two volumes, and there will be new verse by Alfred Noyes and Percy Mackaye. Other books are: "Highways and Byways of the Mississippi Valley," by Clifton Johnson; "The Fair Hills of Ireland," by Stephen Gwynne; "Tarry at Home Travels," by E. E. Hale; "Persia, Past and Present," by A. V. W. Jackson; "A Wanderer in London," by E. V. Lucas, and "Charleston, the Place and the People," by Mrs. St. Julien Ravenel.

The publications of the Pāli Text Society for 1906-1908 are to include the Digha, vol. iii.; the Dhammapada Commentary, the Petakopadesa, the Samanta Pāsādikā, a second edition of vol. i. of the Sutta Nipāta, and the rest of the Patisamhiddā. To come out this year are the commentary on the Dhammapada, the Buddhist hymn-book, edited by Mr. Norman of Benares, and the Patthāna, vol. i., edited by the Hon. Secretary, Miss Caroline Rhys Davids (Harboro Grange, Ashton on Mersey, Cheshire). Since its foundation, in 1882, the society has put out forty-four texts, fifty-seven volumes in all. Its publications are under the general editorship of its managing chairman, Prof. T. W. Rhys Davids. The annual payment of one guinea entitles subscribers to the two yearly volumes. A limited number of back issues are to be had at 10s. 6d. the volume; those of 1882, 1883, and 1885 at one guinea. Another valuable work on Pāli which we may expect to see ere long is the text (the *editio princeps* in Western transliteration) and English rendering of the Visuddhi-Magga or Purity-path, the *magnum opus* on Buddhist doctrine and culture, written in Ceylon by the great commentator of the fifth century A. D., Buddha-ghosa of Patra. The editor, the late Henry Clarke Warren, is already known for his "Buddha in Translations" (Harvard Oriental Series, vol. iii.), a book of considerable repute in circles interested in the history of Buddhism. The Visuddhi-Magga is to be brought out under the supervision of Professor Lanman of Harvard, who has now finished his Atharva Veda.

The *Zentralblatt für Bibliothekswesen* for June contains a memorial sketch of the late university librarian of Leipzig, Otto von Gehhardt, who died last May. He was born in 1844 and, after several years of theological studies at the universities of Dorpat, Tübingen, Göttingen, and Leipzig, entered the services of the University Library at Strassburg in 1875, as Volontar. He was afterwards connected with several libraries, until in 1893 he was appointed to the post which he held at his death. The reorganization of the Leipzig library after its removal to its new house is largely his work, but his name will perhaps be remembered longest in connection with the great manuscript catalogue, of which three volumes have been issued. Like many other German librarians, he found time for much independent scientific work, and published many contributions to theological bibliography and palæography. In the same magazine the art bibliographer, W. L. Schreiber, calls attention to the importance of woodcuts for the determina-

tion of undated incunabula. Although he has received much assistance in his studies of German book illustration from such works as Proctor's Index, Voullième's list of incunabula in Berlin, and Haebler's Typenrepertorium, his own studies have enabled him to supplement and correct some of their investigations. Thus, by examining the woodcuts in the earlier, undated editions of Æsop, he found the one by Johann Zainer in Ulm to be the original from which the others were reprinted.

The thirteenth summer meeting of the American Mathematical Society will be held at Yale University, New Haven, on Monday and Tuesday, September 3 and 4. The colloquium will open on Wednesday, September 5, and close on the following Saturday morning. One course of five lectures on the theory of bilinear functional operations will be given by Prof. E. H. Moore of the University of Chicago; and two courses of four lectures each by Prof. Max Mason of Yale University, and Prof. E. J. Wilczynski of the University of California. Professor Mason will discuss selected topics in the theory of boundary value problems of differential equations, and Professor Wilczynski, projective differential geometry.

The committee nominated by the "Classical Association of England to consider the pronunciation of Latin and Greek has issued a draft report. We are not surprised to find that they have discarded the "English" method so-called, and taken as their starting-point the pronunciation of the Romans and Athenians themselves, of the Romans of the first century B. C., of the Athenians of the fourth. The scheme they have adopted for Latin is substantially the same as that of the Oxford and Cambridge Philological Societies, the text of which is also given here. In both alike a special point is made of "quantity," which is to be strictly observed.

The Royal Engineering College at Cooper's Hill, Windsor, is a striking illustration of one of the principal means by which the English have achieved their success in empire-building. The lessons which the constantly recurring famines impressed upon those sent out to govern India was the absolute necessity of the development of the railway system and the construction of irrigation works. They recognized also that in order to carry out these works speedily and effectively a training in engineering having special reference to Indian requirements was needed. So in 1871 this college was founded, and in the thirty-five years of its existence it has sent out 979 men to the Indian Public Works Service. The character and importance of their work Mr. Brodric, secretary of State for India in the last ministry, eulogized at the closing exercises of the college on July 26. He said that the immense progress of the country was due to nothing so much, not even to education with all its advantages, as to the building of railways, which formed at once a guarantee against famine and a security for commercial development; and to the irrigation works which had not only caused a decrease in the famine areas, but had shown in the more recent famines that the process of recovery, which used to be long and difficult, had been made easy and secure.

At the Sorbonne, the last session of the scholastic year of the Paris University Council was marked by the final leave-taking of the faculty of Protestant theology. In virtue of the law separating Church and State in France this faculty, from the 1st of November next, ceases to be a State institution. The Catholic faculty—an ineffective post-Revolutionary revival of the mediæval creator of *Doctores Sorbonici*—lapsed from existence in the early days of the Third Republic. The Protestant faculty was a matter of patriotism, having been transferred to Paris from Strassburg when Germany annexed Alsace. Before the recent Separation law it was a necessity; the State recognized as Protestant ministers to be salaried and pensioned only university bachelors of divinity. Of recent luminaries the late Dean Sabatier, whose works on the philosophy of religion have been much read in the English edition, was best known. Among present professors M. Bonet-Maury has left many friends in the United States.

Baron Franz von Lipperheide, the well-known Berlin publisher, who has just died in Munich, was a distinguished figure among Berlin publishers and literary men. The publisher of *Modewelt* and the *Illustrirte Frauenzeitung*, he was better known as the generous donor of the Library of Dress and Costumes in the Berlin Museum of Industrial Art. This comprises eleven thousand volumes and thirty thousand valuable fashion-plates, a veritable treasure-house for painter, sculptor, or writer. Baron von Lipperheide was also an author, his latest work being a very elaborate dictionary of adages, proverbs, and maxims.

According to the annual report of the University of Berlin for 1905-1906, which has just appeared, no less than eleven doctents died during this period, while sixteen left and eleven others were called. Seventeen *privat-dozenten* obtained permission to teach, one in the theological, one in the law, three in the medical, and twelve in the philosophical faculties. Last summer 6,856 students attended lectures, and last winter 9,204. Two hundred and forty-five students took degrees, two of them with special honors. The University received during the year a bequest of \$25,000 from Frau Anna Weinhold, the widow of the Germanistic professor, the interest of which is to be used to aid indigent orphans or widows of professors of the university. It is interesting to note that the total sum paid out in scholarships or other aids in 1905-06 amounted to \$27,586.75. The readiness of professors to utilize their own means to aid the work of the University appears from the fact that Prof. Adolf Wagner bestowed part of the money given him by friends and admirers in recognition of his seventieth birthday upon Frau Marie Schwab as a prize for her published work on Chamberlain's tariff policy. A similar gift conferred upon Professor Tobler on his seventieth birthday was bestowed by him, in accordance however with the terms of the gift, upon the library of the Seminary of Romance Philology. The new seminary for Musical History occupies this year rooms of its own in the old Academy of Architecture, and uses there a valuable collection of music and books, partly a gift, and partly a loan of duplicates from the Royal Library. The new building of

the Hygienic Institute, just finished, has cost the University \$175,000, inclusive of the scientific apparatus.

There are few university teachers in Germany to-day who enjoy so widespread an esteem or are exerting so wholesome an influence upon large masses of students as Prof. Friedrich Paulsen of Berlin. It is gratifying to note that the 16th of last month, Paulsen's sixtieth birthday, was made the occasion of an impressive and entirely spontaneous demonstration of good will toward him. Hundreds of former pupils and friends from all parts of the world sent their greetings; the Germans of Transylvania presented him in a body with an address and with views of castles and churches of their country; while thirty of his Berlin pupils and friends united to give him a bust of Immanuel Kant. In a circular letter, which lies before us, Professor Paulsen expresses his gratitude for all these tokens of affection in his well-known genuine and simple manner, and pledges himself anew to the ideals of his work. The sturdy independence of his temper is freshly illustrated in this letter by his applying to himself the words of Erasmus: "Semper solus esse volui nec quicquam peius odi quam iuratos et factiosos." Fortunately, in Paulsen's case this Erasmian independence has led to the very opposite of Erasmian isolation and acrimony.

Prof. Eugen Kühnemann of Breslau University, who, it will be remembered, is to be the visiting professor of German literature at Harvard University during the coming winter in the interchange of professors between America and Germany, has just published an account of the work that has been done during the last ten years in Prussian Poland for the cultivation of German intellectual and artistic life in that province—a work in which he, as the first president of the Royal Academy at Posen, has had a prominent share. The booklet, which bears the title "Von der deutschen Kulturpolitik in Posen" (Merzbach'sche Verlagsanstalt, Posen), is mainly concerned with the development of three institutions: the Kaiser Wilhelm Library, the Kaiser Friedrich Museum, and the Royal Academy. All three institutions are outgrowths of what in the first place were rather insignificant local organizations; but through the subsequent coöperation of the Prussian Government and the widespread interest taken in them by the German people they have come to be of national importance. The Kaiser Wilhelm Library received aid from 400 German cities; 279 publishing houses from all parts of the Empire made gratuitous contributions of their publications; all German railways handled freight for it without charge; the Prussian Government contributed to the building expenses the sum of 549,000 marks. It is interesting to note that the library, which at present embraces more than 100,000 volumes, is designed as a "Volksleshalle" on a grand scale and as a "reservoir for all popular libraries and reading rooms in the whole province," thus clearly indicating its indebtedness to American methods of library administration.

The Kaiser Friedrich Museum is installed in a building toward which the Prussian Government contributed 900,000

marks. It is devoted partly to provincial history, art, and physical products, partly to reproductions of masterpieces of ancient and modern sculpture; and it contains provisions for regular courses of lectures by specialists on the general history of art. The Royal Academy, finally, is intended to form a centre for all the higher intellectual and spiritual interests of the province. It embraces nearly all the subjects included in the "philosophische Facultät" of a German university; but it does not give any diplomas to its hearers, and it admits as bearers both men and women possessing certificates equivalent to the *Einjährig-Freiwilligen Examen*. As a matter of fact, the hearers belong largely to the official circles, both military and civil, and to the business world of the provincial capital. The first semester, in the winter of 1903-04, had an attendance of 1,160 persons; last winter showed a falling off to 986, of which 455 were women.

"Neolithic Man in Northeast Surrey," by Walter John and William Wright, illustrated by Sidney Harrowing and Percy Frank Smith (cheap reissue, Eliot Stock) embodies the archaeological investigations of several years in the corner between the Thames on the north and Boxhill and Oxted on the south. It contains all that its authors have been able to gather as to the Neolithic inhabitants of this region; dealing in turn with their burial-places, their trackways and fortifications, their methods of work, their food, and their implements, celts, scrapers, borers, arrowheads, etc. By way of introduction to their main subject the authors discuss the geological features of Surrey in Neolithic times, and the sequence of races in Britain. The book is certainly worthy of praise. The local knowledge displayed in it is extensive and thorough, and the standard of scholarship unusually high. The would-be antiquarian for whom this edition is obviously intended, will find it a useful and accurate guide.

That anonymous and admirable English poet of the fourteenth century who wrote "Pearl" and "Sir Gawayne and the Green Knight" has enjoyed of late a somewhat singular vogue. The enthusiastic but rather sentimental praise of Ten Brink and others and the excellent edition of Mr. Gollancz have given the poet, whether Chaucer's "philosophical Strode" or another, an academic repute for many years, but now he seems about to cut a considerable figure in contemporary belles-lettres. Two years ago, his "Sir Gawayne and the Green Knight" was made the basis of a whimsical paraphrase by Prof. Charlton M. Lewis, who approached the old romantic story in something of a Byronic temper, or, to be more precise, in that gay spirit wherewith Pulci and Boiardo treated the heroic legends of Roland. In the present season we have two modern English metrical versions of "Pearl" conceived in the most serious and sympathetic mood; one by G. G. Coulton (Nutt), and one by Dr. S. Weir Mitchell (The Century Co.). Both poets avow a disbelief in the theory now of wide acceptance that the poem is wholly a religious allegory written by an ecclesiastic; and both earnestly assert it to be the sincere and poignant lament of a father for his daughter. Both minimize rather too decidedly the hearing of Prof. W. H. Scho-

field's recent important discovery that the piece is in substance a translation of Boccaccio's fourteenth eclogue, written in memory of his daughter Violante; but both make a good case for the unecclesiastical humanity of their author. This contention, in our opinion, might have been still further strengthened by a reference to "Sir Gawayne and the Green Knight." The poet who penned the sympathetic, and, so to say, Shawesque, temptation scenes between Sir Gawayne and the Lady of the Castle might, as a layman, have compassed without insincerity the range between them and the idealizing devotion of "Pearl,"—but scarcely as a priest.

In the case of two versions of the same piece so honestly wrought as these, comparisons are not odious but interesting. Mr. Coulton has attempted to render the poem in entirety with the utmost fidelity, and in the metre and rhyme system of the original; Dr. Mitchell, on the other hand, has aimed at a pleasing and suggestive paraphrase; he has omitted a number of stanzas of the more allegorical cast and has adopted a slightly easier metrical form. The virtues of the two versions are consonant with their diverse aims. Mr. Coulton's is the more resourceful and adroit in solving difficulties and in communicating something of the color and tang of the original, though these qualities of his work could perhaps hardly be savored without some technical knowledge of Middle English idioms; Dr. Mitchell's version is the suaver in tone, and conceived, if with less zest for the flavor of the old poet's style—yet with a deeper partaking in his mood. It concludes with "an afterword," which, whatever we may think of its substance, considered as scholarship, is of a penetrating poignancy:

A little grave, a nameless man's distress,
And lo! a wail of lyric tenderness,
Unheard, unseen for half a thousand years,
Asks from love's equal loss the praise of tears.

Under the rather misleading title of "The Undying Past," Beatrice Marshall, whose British nationality shows itself in such words as "bar-maid," "luggage," and "parcel," offers, through John Lane, the first translation into English of Hermann Sudermann's "Es War" ("Once Upon a Time"), written by that author in 1884, and only published ten years later when encouraged by the success of "Frau Sorge." It is a story familiar to all students of Sudermann as setting forth, with a somewhat weaker hand, the same antipathies observable in "Dame Care"—disbelief in penitential tears without good works as a means of salvation, disgust with the established German church and the fattened clergy, and contempt for the corps-student, with his challenges, duels, and idle hours. The writer, who has already translated Sudermann's "Regina," sticks faithfully to the text, refreshing it here and there with colloquial talk or such a variant as "snigger," and touching up the prosy places with more or less untranslatable German. That which is eminently unsatisfactory, besides the title, however—and it is a deficiency usually observable in translations of novels whose publishers eye too parsimoniously every additional page of type and paper—is the absence of any biographical introduction by which the reader may learn something of the German author, his place in modern literature,

when the book in question was written and to what degree of success it has attained. Such a note, for example, could have told us that Sudermann has penned but few novels, and that he seems to have now given himself up entirely to the drama; that "Es War" has been only about half as popular abroad as "Frau Sorge," a translation of which in English has been out since 1891; and that yet "Es War" had, by July of the present year, almost reached its fortieth edition in Germany.

There is very little of the blend of realism and mysticism usually associated with the name of Emilia Pardo Bazán in "The Mystery of the Lost Dauphin," translated from the Spanish by Annahel Hord Seeger (Funk & Wagnalls Co). It is, on the contrary, decidedly melodramatic, and abounds in romantic elements of a kind to make Miss Corelli turn pale with envy. The novel is so well constructed, there is so much rich color in the landscapes, and so much clever character drawing that, at first sight, it seems strange it does not interest one particularly. But the reason is not far to seek. It is a novel of propaganda. Señora Pardo Bazán believes devoutly that Naundorff, the disreputable Jewish peddler of Prussia, is the true prince, and his present Majesty, Jean III., would be now enthroned in Paris, if everybody had his rights. Now, if the late R. L. Stevenson had set out to prove through the medium of an historical novel that Lambert Simnel, and not Henry VII., was the legitimate King of England, even his genius would have hardly succeeded in making the tale attractive to the general reader. The fact that Henry made Lambert a scullion in the royal kitchen would destroy all the romance of it. So the sordid characteristics of Naundorff's early life dispel the illusion in which the author envelops her hero. And yet it is a pity that so much high intensity of dramatic emotion should be so wasted. Not only is the señora an adept in the management of such old-time melodramatic paraphernalia as sliding panels, midnight murders, tortures, and such like, but, not unfrequently, we have a revelation of the profound insight which enabled her to penetrate into the core of the heart of Madrid in "Morrina," and to lay bare the most elusive qualities of the Gallician temperament in the "Pazos de Ulloa." The picture of Louis XVIII. might have been done by Balzac: the placid irony, sentimentality, and pedantry of the monarch "who read Horace in public, and yellowbacks when alone" is hit off admirably, although the exigencies of the case require that he should be something of a fiendish scoundrel, which is unjust to the poor *goutteux*; and Volpetti, the spy, though evidently suggested by the Corentin of "Une Ténébreuse Affaire," does not suffer by comparison with his prototype.

Miss Alice C. Gausson has definitely joined herself to the band of English writers who are exploiting the eighteenth century, not for the most part, it must be said, with much learning or talent. Two years ago she published a work of some bulk and seriousness, which was built about the correspondence of Sir William Weller Pepys (1758-1825; of the family of the great diarist, to which Miss Gausson is herself related) with Mrs. Montagu, Hannah More, and other much-writing folk of the age.

Now she adds rather a flimsy volume entitled, "A Woman of Wit and Wisdom" (E. P. Dutton & Co., \$3 net), which introduces us to the same fluttering society of the *bas bleus*. Her subject, Elizabeth Carter, has the advantage of being really erudite, whereas most of the ladies of that set had a large amount of pretension, not to say conceit, on a small basis of knowledge. Mrs. Carter read Latin and Greek and Hebrew, besides most of the modern languages, and she read them with understanding. Her translation of Epictetus brought her a deserved reputation—and a very comfortable sum of money. Fanny Burney once said of her that she knew books, but that of life and manners she was as ignorant as a nun. As a matter of fact, Mrs. Carter, while not possessing Miss Burney's dramatic skill, had a very fair vision of life and far more of reflection than the author of "Evelina" could boast. Her letters are filled with shrewd comments and bits of humorous philosophy. Though most of her eighty-eight years were passed in the remote Kentish town of Deal, where she fortified herself for continued study with the use of snuff, wet towels, and the chewing of green tea and coffee, yet she was not a recluse in any sense. She writes once to a friend:

I have played the rake enormously these last two days, and sat up till near three in the morning. I walked three miles in a wind that I thought would have blown me out of this planet, danced nine hours, and then walked back again. I am not so devoted to these earthly entertainments, but that I still retain a great regard to the stars.

She was a friend of Archbishop Secker (whom Horace Walpole so ridiculed for his hasty time-serving) and a frequent visitor at Lambeth Palace. Dr. Johnson, too, gave her a genuine admiration, which he never bestowed on Mrs. Montagu or any other woman of the circle, except his thrice-dear Fanny. All this happy life Miss Gausson sets forth, but in a fashion so scrappy and inconsequent as to destroy half the interest of her theme. She has, moreover, a peculiar trick of irrelevance. "It was written," she remarks casually, of a play, "in 1784, the year of his death, by James Thomson, author of 'The Seasons,' the Roxburghshire poet, who was born at Ednam in 1700." The habit is absurdly conspicuous in most of these semi-literary exploiters of the eighteenth century. It would appear that literature is a new discovery for them.

Higher critics of the Old Testament have often urged that their arguments can be approved by non-technical students; they ought not, therefore, to take it amiss if a stranger to critical studies conducts an examination of some of their principal theories, even though the verdict be unfavorable. Such is the case with the Rev. Randolph H. McKim of the Church of the Epiphany, Washington, D. C., in a volume entitled "The Problem of the Pentateuch" (Longmans, Green & Co., \$1 net). Dr. McKim writes as "one of the jury" to whom the case for the documentary origin of the Pentateuch and the theory associated with the names of Graf and Wellhausen has been submitted, and he pronounces himself thoroughly unconvinced. He does not deny that documents were used in the composition of the early books of the Bible, but that any literary analysis can

now separate them he will not believe. In this respect, he is not as open-minded as Prof. James Orr, who admits freely that the separation of the priestly document from the prophetic histories is now too firmly fixed to be shaken. The Josian date of Deuteronomy and the exilic origin of the priestly portions of the Pentateuch are views particularly objectionable to Dr. McKim. Despite the pains he has taken in the investigation of these matters, it cannot be said that he has comprehended the case put forward by historical criticism. Had he done so, he could not have written that the Graf-Wellhausen hypothesis is "based predominantly on philology." Philology, to be sure, enters into the argument, but the basis of the critical views is the historical principle of development. As long as men could believe that a highly developed system of morals and a noble religious faith could spring up almost in a day among a few tribes of Bedouins lately escaped from slavery, so long the traditional view of Hebrew history was possible. In a world which believes that moral ideals and religious beliefs grow slowly, as do all things else, some such view must certainly be held as that which Dr. McKim rejects. It is of no use to plead that the higher criticism is "destructive of the divine origin of the Jewish religion and destructive also of the divine authority of our Lord Jesus Christ." In the face of such warnings critical views have steadily gained converts, and they must be met, if they are to be met at all, by a yet more credible construction of the history, based on examination of the sources, rather than by exhibition of disagreements among competent Hebraists and by waving the red flag of danger to piety.

At a time when the pioneers of Western exploration are honored daily by marble statues and expensive reprints, it is impossible to ignore La Salle. Father Hennepin has reached the dignity of being modelled in butter at the Louisiana Purchase Exposition, and Wisconsin sends a striking figure of Father Marquette to represent her in the statuary hall of the Capitol; but however great the fame of these and other ecclesiastics, it can never eclipse the renown of the intrepid layman who with self-confidence went on his way even when it carried him athwart the Jesuits. The perennial interest in La Salle's career is once more attested by the simultaneous publication of two works which contain original accounts of his expeditions to the Mississippi valley. One of these—"The Journeys of La Salle"—is edited by Dr. I. J. Cox, and forms a contribution in two volumes to the "Trail Makers" series (New York: Barnes). The other is Joutel's "Journal of La Salle's Last Voyage," with an introduction and notes by Dr. H. R. Stiles (Albany: McDonough). As Dr. Cox's second volume is occupied with the text of Joutel's "Journal," these two reprints run parallel to that extent. But Dr. Stiles gives without change the first English translation of 1714, whereas in the other edition the spelling has been modernized. This difference is accounted for by a corresponding difference in aim. Dr. Cox contributes to a popular series in which each volume is sold at a low figure, while Dr. Stiles, avowedly

following in the footsteps of Shea, appeals to the smaller circles of scholars and collectors. Dr. Cox's first volume embraces such narratives of Tonty, Membré, Hennepin, Douay, Le Clercq, and Jean Cavalier, as deal with La Salle's expeditions. Dr. Stiles, on the contrary, restricts himself to Joutel. Both editors have, in the main, accomplished what they set out to do, for Dr. Cox furnishes the general public with the leading texts in convenient form, which apparently is all that he and his publisher designed. Dr. Stiles, restricting himself to a single classic, has worked upon it intensively, though he cannot be taxed with overminuteness. If his annotations were more detailed the result perhaps would be more satisfactory than it is, but we are not disposed to cavil at such a beautiful example of book-making, when, after all, it gives us a careful recension of an important text. We subjoin Joutel's verdict upon La Salle's character since, with the utmost terseness, it seems to bring out the essential facts:

He had a Capacity and Talent to make his Enterprize successful; his Constancy and Courage and his extraordinary knowledge in Arts and Sciences, which render'd him fit for any Thing, together with an indefatigable Body, which made him surmount all Difficulties, would have procured a glorious Issue to his Undertaking, had not all those excellent Qualities been counterbalanced by too haughty a Behaviour, which sometimes made him insupportable, and by a Rigidity towards those that were under his Command, which at last drew on him an implacable Hatred, and was the Occasion of his Death.

A. P. C. Griffin, of the Congressional Library, has enriched Dr. Stiles's edition of Joutel with an excellent "Bibliography of the Discovery and Exploration of the Mississippi Valley." However, as bibliographers love absolute accuracy, we may point out that M. Benjamin Sulte does not spell his name with an accent.

A portrait of Mrs. Edwards by Fantin-Latour has been presented to the city of Paris, for the Petit Palais, by Madame Fantin-Latour. This will be one of very few portraits of a living personage in the Petit Palais. Mrs. Edwards and her late husband were almost lifelong friends of the artist. Another gift to the Petit Palais is "La Carola," by Edouard Dufeu, presented by Mme. Esnault-Pelterie; another is a bust of Harpignies by Ségoffin.

The French Minister of Finance, looking everywhere for money, has suggested a tax on imported pictures and art objects. The *Athenaeum* comments on the proposal as follows:

As the tax . . . is estimated to produce only £60,000 a year, some suspect that the real object behind it must be rather protection than revenue. But would not the chief effect be to protect the great French masters of the eighteenth century against their British rivals of that date? If the objects imported were to be stamped on the back, there might, however, be some incidental check on the arrival from London of "Turners" of high merit never known to Turner.

The life of Vincenzo Foppa (*ob.* 1492), the founder of the early Lombard school, is being written by Miss C. Jocelyn Ffoulkes and the Rev. Rodolfo Maiocchi of Pavia. This book, which will be published by John Lane, will embody the results of the most recent and exhaustive researches in Italian archives, and will contain repro-

ductions of all the known works of this rare master. The authors wish to make the list of works as complete as possible, and would be glad to hear from any collector possessing paintings or drawings by Foppa or his immediate followers. The period of the artist's activity covers a space of more than sixty years—a fact only recently discovered—so that some of his late works may now be in existence unrecognized.

An important example of Lucas Cranach the Elder has just been bought by the Städelsches Institut, Frankfurt. It is a triptych, painted, as an inscription attests, in the year 1509. It is believed to be the famous altar piece painted for the church at Torgau. The central panel represents the Virgin and St. Anne seated in a columned hall; St. Joseph sleeps in the background. The infant Jesus and St. John play in the foreground. Portraits of the princely family of Mecklenburg are recognized in the picture. In the left wing the Virgin gives suck to the Holy Child. A princely donor is in the distance. There is a fine landscape as background. In the right wing St. Anne, a portrait, again appears, caring for the Christ Child and St. John; a donor reads in the background. The work is said to show strong Flemish influence, and to rank with the best of the Cranachs' productions.

Wagner and Puccini, we read, accounted for more than two-thirds of the total number of performances given at the late opera season in London.

The English assert that both of Puccini's most popular operas, "La Bohème" and "Madame Butterfly," have reached the world from Italy via England. The last-named work, indeed, did not win favor in Italy until after London had put on its seal of approval. This resulted also in a production in Budapest, in the promise of a performance in Paris, and in arrangements for both English and Italian performances in New York. When first given in Milan, it was hissed, and the composer has confided to a friend that he will have no more operas produced in that city, and will probably favor London for his next *première*. He has already chosen a subject for his next opera—Pierre Long's novel "La Femme de Le Pantin."

It is amusing to find in a volume recently issued in Munich, containing the reminiscences, diaries, and letters of Hermann Zumpe, the following estimate, dated 1871, of Wagner's "Die Meistersinger": "The opera left me perfectly cold. There is no soul here, no noble passion. Cleverness and dexterity one cannot deny Wagner, but that is no praise for a great composer. The fact is that, to put it in a few words, Wagner is not a composer by the grace of God. Better none at all than such a one." The man who wrote this subsequently became one of the most ardent Wagnerian enthusiasts and missionaries, although he was not one of the greatest of his interpreters. In his Bayreuth notes, Zumpe gives an instance of Wagner's willingness to change his mind. Wagner had entertained a prejudice against the famous Munich tenor, Vogl. Efforts were made on all sides to overcome this feeling, and finally Wagner invited him to Bayreuth. The tenor came, sang, and conquered. Wagner embraced him and begged his forgiveness.

Among Zumpe's aphorisms occur the following two: "There are two types of conductors, pigs and martyrs. Few die the death of the latter."

Mr. Harvey Worthington Loomis is preparing for publication a collection of seventy-five original children's songs. Heretofore the leading American composers have strangely neglected this field, and it is therefore encouraging to find Mr. Loomis devoting himself to this task, which is one of the utmost importance, for it is only by educating these adults of the future up to good music that America can ever become a musical country. Mr. Loomis is very optimistic. He believes that the music of the Tenderloin is our real folk music, and that some day a genuine American art will be built upon it. Perhaps it will—somewhat in the same way in which the rags a tramp wears may be converted into fine writing paper; but in no other way that we can see.

One of the events of the next musical season will be the first performance in this country of the violin concerto of Sibelius, by Maud Powell, at the second pair of Philharmonic concerts under the direction of Mr. Safonoff. Sibelius is one of the most interesting of the younger composers; he has not only local color characteristic of Finland, his native country, but he has what so few have—melodic ideas. It will be remembered that Dvorák invited Miss Powell to give his own violin concerto its first hearing at a New York Philharmonic concert. Last season she played Henry Holden Huss's concerto, for the first time anywhere. Camille Saint-Saëns requested her four years ago in London to play his B minor concerto under his own direction, and, when Max Bruch heard her play one of his own concertos he was so much pleased that he assured her she played it better than Sarasate, to whom he had dedicated it. Miss Powell also gave the Tchaikovsky concerto its first American production under the baton of Theodore Thomas.

RECENT POETRY.

When a young poet publishes his works dramatic and lyrical in a quarto volume nearly two inches thick on a very expensive grade of paper it is difficult for the poetic critic to approach it in the genial and receptive temper wherewith he turns to the traditional slender and modest book of song. It is inevitable that he should be provoked to measure it by more difficult standards and search it with a more judicial eye. It cannot be said that the handsome volume of "Plays and Lyrics" by Cale Young Rice (McClure, Phillips & Co.) wins through such a test very triumphantly. Though Mr. Rice states 'In his preface that his desire has been to include only his best work, he has omitted his vivid, if youthful, tragedy, "Charles dl Tocca," in favor of his melodramatic and unsatisfactory "David," of which mention has already been made in these columns; and it is extremely questionable whether "Yolanda of Cyprus," the new play with which the volume opens, can afford any reader as much poetic pleasure as the earlier piece. "Yolanda" is a play of adultery, intrigue, and sacrifice, which, however, ends with the happiness of its chief character. It is conceived with a certain

vigor, and executed with a considerable richness of romantic background, but it begins too violently, and it is carried through at fever heat with little or no relief or artistic modulation of mood, while the ejaculatory blank verse, with its numerous violences of phrase, does little to mitigate the mad precipitation of the plot. A little more restraint, a little firmer handling of structural form—in short a little more "seriousness" might have made it an admirable and a pleasurable performance.

The lyrics which make up the bulk of the book have the merits and defects of the dramatic pieces. Part of the poet's equipment Mr. Rice has amply. He is moodily aware of the passionate issues of life, particularly as they have been revived in the pages of the English romantic poets; he has an excellent command of picturesque diction; but the defects of these qualities are his in excess. Too often a certain fragrant mood, expressed in too picturesque diction, gives his work a gasconading flavor which fails to afford the reader the fullest aesthetic pleasure. If it be true, as many have thought, that the dark night of poetry which now envelops us is the sequel of the long day of romanticism, and soon to be succeeded in turn by a more enlightened, more humane classicism, then Mr. Rice's ambitious work is a significant document. For, like the writing of some of the latest of the Jacobean dramatists, it presents the spectacle of a passionate romanticism, unballasted by true poetic scholarship, and unplotted by effective art. But it is perhaps unfair to Mr. Rice to allow the magnitude and material splendor of his volume to incite us to swell that cold wind of criticism, which, we may hope, foreruns the dawn. Occasionally he writes in simplicity as well as sincerity, without labored linguistic bravuras; or moody excesses: at such times, if not impeccable, he is often pleasantly poignant; as in this little song:

I met a child upon the moor
A-wading down the heather;
She put her hand into my own,
We crossed the fields together.

I led her to her father's door—
A cottage mid the clover,
I left her—and the world grew poor
To me, a childless rover.

I met a maid upon the moor,
The morrow was her wedding.
Love lit her eyes with lovelier hues
Than the eve-star was shedding.

She looked a sweet good-bye to me,
And o'er the stile went singing.
Down all the lonely night I heard
But bridal bells a-ringing.

I met a mother on the moor,
By a new grave a-praying,
The happy swallows in the blue
Upon the winds were playing.

"Would I were in his grave," I said,
"And he beside her standing!"
There was no heart to break if death
For me had made demanding.

"Corydon, an Elegy in Memory of Matthew Arnold and Oxford," by Reginald Fanshawe (Henry Frowde) is no such "slender shallop of lament" as its author modestly alleges. It is a volume of two hundred and twenty-four Spenserian stanzas, preceded by an elaborate and somewhat tremendous analysis, wherein we are told that this stanza treats of "Arnold

Toynbee and a new social ideal," that of "T. H. Green and idealism," etc., etc. Yet in passing from the programme to the performance itself the reader is most pleasantly surprised to find it continuously informed by a mellow poetic mood, and containing scarcely a lapse from suave and accomplished workmanship. The tone is frankly academic and traditional, and most successfully so. Save for the sensitiveness to vaulting intellectual systems and the lack of the instinct for compression, one could almost imagine some later Gray living retired in "sullen" chambers, and composing such polished, thoughtful stanzas as these. Perhaps the first trait that strikes the reader is the curious felicity of critical characterizations, but a line long—a felicity recalling the masterly triumphs in this kind of William Watson. Take this of Arnold:

A sad Ulysses of the spirit's quest,
or this of Tennyson:

Imbued

With tears and tender gleams of grave Virgilian mood,

or this of Browning:

Subtlest apologist of groping souls that grow,
or this of Mr. Swinburne:

The lavish lord of sweet sonorous lyre.

Or take as an example of set criticism in verse this elaborate "codification" of Arnold—occupying an entire stanza:

O nature strangely blent; light petulance
Of airy laughter; huoyant ease urhane
Of world and youth; the lucid lips of France;
Some breath of Byron's sick romantic pain,
Dispassionate, purged; bright cynic-edged disdain
Of Heine, clean unpolignant; peace austere,
Wordsworth's high woodland peace, unrapturous, sane;
Goethe's grave calm Olympian; Attic clear
Vision and wistful doubt and Stoic will severe.

The texture of the piece, however, is imperfectly represented by such close-packed stanzas as this. The whole poem is pervaded by the spell of the "sweet city with the dreaming spires," by "the last enchantments of the middle-age." Not seldom it rises from admirably versified criticism into poetry of grave and haunting music:

O south-wind sougning in the peulsive pine!
O haunting flute of silent Corydon!
What mystic hurden mingled, his and thine,
Speaks to my spirit ever and anon
Of half forgotten things, of roses gone,
Echo of empty life's long monotone,
Warm wafts from magic woods of Marathon,
What hope of deepening meadows, still unmown
After long arid May! What breath of spring unblown!

Now the last cuckoo hardly seems to cease
In liquid silence. Lingers twilight-stoled
Peace on the height and in the hollow peace.
The brooding elms with purple wings unfold
The steading's russet roof, the nestling gold
Of carven haystack. Eye, calm eye, hath strewn
Her incommunicable stillness old
Over the fragrant face of midmost June,
Bowed to the benediction of her mellow moon.

Perhaps even more than in most formally elegiac verse there is a lack of intensity, of original poetic energy in the conception of this that makes against its wide and enduring appeal, but for lovers of the old sonorities of the academic muse who are not averse even from her a-priorities, this mellow, deeply meditated monotone will have a potent charm.

In "The Door of Humility" (Macmillan Co.) Alfred Austin, also, has, as is habit-

ual with him, rested content with the academic manner. "The Door of Humility" is a poem of some two hundred pages, resembling "In Memoriam" in its structure of quasi-lyric sections in four-line stanzas, though it is slightly differentiated by alternate rhyme. The substance of the poem is an account of a kind of sentimental *Wanderjahr*. The poet, being in love with an English maiden, is yet too proud to please her, and is told to keep away until he shall come with humble mind. He thereupon visits Florence and Rome, experiencing the customary emotions, and finally goes to Constantinople, whence he is recalled by the news of his sweetheart's dangerous illness. He arrives, acceptably humble, in time to receive her last valediction in eighteen stanzas, of which these four may be taken as an adequate sample:

As in the far-off boyish year
When did your singing voice awake,
Disinterestedly revere
And love it for its own great sake.

And when life takes autumnal hues
With fervent reminiscence woo
All the affections of the Muse
And write the poem lived by you.

And should, until your days shall end,
You still the lyric voice retain,
With its seductive music blend
A graver note, a loftier strain.

While huoyant youth and manhood strong
Follow where Siren sounds entice,
The Deities of Love and Song,
Rapture and Loveliness, suffice.

The piece is as a whole marked by suavity and a kind of thin dignity, though not seldom there is a lapse into banality, as where Mr. Austin, in a section faintly recalling a famous lyric by his great predecessor, writes:

The belfry strikes the silvery hour
Announcing her propinquity.

In passages the poem is not unpleasant reading, but as a whole it is an illustration of the old way of kings' laureates, who have too often felt at liberty to be as tedious as a king.

"Love's Testament," a sonnet sequence by G. Constant Lounsbury (John Lane Co.), differs from most sonnet sequences of idealizing passion in a certain piquancy of thought under-running the mood, and in the somewhat singular phenomenon that the cycle ends in a situation of cynical disillusion. The rather attractive quality of the sequence may be judged from this sample:

The gracious ghosts of those old sonneteers,
Whose memory glows with an immortal flame,
Wearing the mantle of a deathless fame,
That fades not with the falling of the years:
Shakespeare and Dante, Petrarch, equal seers,
Each with his threatening and majestic name,
To me, a humble poet, proudly came,
As I sat dreaming in the vale of tears.

And pity and rebuke I seemed to read
On every face at my audacity,
Till suddenly, in my bewildered need,
I bid them look, oh love of mine, on thee!
Then all astonished at the joyous sight
They vanished, and an unseen voice cried, "Write!"

After a dozen years we have a new edition of A. E. Housman's little book of vivid verse, entitled "A Shropshire Lad" (John Lane Co.). Mr. Housman has a masterly way of concealing an accomplished poetic art. His songs, put into the mouth of his Shropshire lad, are, in their preoccupation with the light loves of lads

and the girls, a kind of rustic Anacreon for the times; but with a difference. Ale here takes the place of the subtler juice of the grape as a subsidiary inspiration, sometimes with Kipling-esque results, as where the lad sings—

Oh many a peer of England hrews
Livelier liquor than the Muse,
And malt does more than Milton can
To justify God's ways to man.
Ale, man, ale's the stuff to drink
For fellows whom it hurts to think.

But the epicureanism of the lad is shadowed by a hue of modern fatalism which suggests that the temper of the peasantry in Shropshire may be little different from that of Mr. Hardy's Wessex. Perhaps the most characteristic, and in a way the most significant things in the book, are certain lyrics like "The Immortal Part," wherein a view of the world invincibly macabresque is phrased with a certain British obstinacy of manhood, that sharply contrasts with the turn a similar theme is apt to take in the hands of a continental poet:

When I meet the morning beam,
Or lay me down at night to-dream,
I hear my bones within me say,
"Another night, another day.

"Wanderers eastward, wanderers west,
Know you why you cannot rest?
'Tis that every mother's son
Travails with a skeleton. . . .

"Therefore they shall do my will
To-day while I am master still,
And flesh and soul, now both are strong,
Shall hale the sullen slaves along.

"Before this fire of sense decay,
This smoke of thought blow clean away,
And leave with ancient night alone
The steadfast and enduring bone."

Lloyd Mifflin's "My Lady of Dream" (Henry Rowde) is a collection of love lyrics informed with that pleasantly sentimental, fluent lyricism with which Mr. Mifflin's readers are familiar. The little piece entitled "The Tryst With His Love" fairly embodies its fragile charm.

When the wings of the twilight-legion
And the ghosts of the sunset pale,
I float in the nebulous region
Of a spirit-haunted vale:
By the marge of the mystical river
I make of my love a lyre,
For she is a reed a-quiver,
And I am the wind, her desire.

The poems of Meredith Nicholson (Bobbs-Merrill) show most of the merits of the enlightened Indiana muse. Despite many fine single lines in the book, it is mainly pleasurable because of its variety of reminiscent moods. The fantastic melodies of Poe, the glamour of the neo-Celtic renaissance, the large patriotic strain of Lowell, the polish of Præd—Mr. Nicholson has admired them all, and has written in similar strains with intelligence and taste and with a certain clear-headedness and right feeling of his own that keep the result from being disagreeably imitative. But perhaps Mr. Nicholson is most memorable as well as most wholly himself when he adopts the tone of bookish but pithy quaintness, as in "Wide Margins."

Print not my Book of Days, I pray,
On meagre page, in type compact,
Lest the Great Reader's calm eye stray
Skippingly through from fact to fact;

But let there be a liberal space
At least 'twixt lines where ill is writ,
That I with tempering hand may trace
A word to dull the edge of it.

And save for me a margin wide
Where I may scribble at my ease
Elucidative note and guide
Of most adroit apologies!

The five volumes of Bliss Carman's series, "Pipes of Pan," are now published by L. C. Page & Co. in what purports to be the definitive edition, but which is actually only the sheets of the five separate volumes bound together, each with its separate preliminary matter and pagination. As we have spoken from time to time of the separate volumes as they have been issued, there is no call to discuss them here, though it may be said that this grouping of his later work in one portly volume makes even more clear than the separate volumes have done that Mr. Carman is paying the penalty of too great poetic fluency. There is perhaps nobody in his generation who is more uninterruptedly master of poetic tone. There is scarcely a piece in the present volume that is devoid of melodious cadences and poetic imagery, yet the effect of the whole is of sunrise on a foggy morning at sea. There is a seductively colored mist of poetry, but an obscuration of landmarks. Mr. Carman's later work lacks poetic intensity, and the reader of it takes little away with him.

Miss Florence Wilkinson's "The Far Country" (McClure, Phillips & Co.) is a volume of uneven, but on the whole, singularly poetic verse. Miss Wilkinson has evidently wandered long on the misty moorlands of the Celtic renaissance, but though she has become imbued with much of the spirit of that haunting music, there is a humanism behind her writing, a vividness of imagination and a cling of phrase, that differentiates her work at its best from most of that which has been produced under the inspiration of the harp that now sounds again in Tara's halls. There is something of wildness in the flavor of her work, but it is not the offensive wildness which is sometimes the result of an earnest effort to escape the commonplace, for Miss Wilkinson, we believe, could not be commonplace if she tried. Her volume gives abundant evidence of the possession at least of those elements of genius which are set forth in this characteristic poem:

What seest thou on yonder desert plain,
Large, vague, and void?
I see a city full of flickering streets,
I hear the hum of myriad engine beats.
What seest thou?
I see a desert plain
Large, vague, and void.

What seest thou in yonder human face,
Pale, frail, and small?
I read a page of poetry, of sin,
I see a soul by tragedy worn thin.
What seest thou?
I see a human face
Pale, frail, and small.

What seest thou at yonder dim cross-roads
Beside that shuttered inn?
Untravelled Possibility,
The Inn of Splendid Mystery.
What seest thou?
I see the dim cross-roads
Beside a shuttered inn.

A little sharper discrimination between profusion and diffusion, a little sterner renunciation of unreal and extraneous adornment, a little firmer grasp of organic structure, and Miss Wilkinson will be a poet to reckon with.

Mrs. Louise Morgan Sill, in a collection entitled "In Sun or Shade" (Harper & Bros.), shows a predilection for looking down to

Camelot which suggests Miss Wilkinson. With less of original endowment, she has perhaps a firmer touch with the file. Although there is much in her book which is rather dull, occasionally, as in this "Song of the Paving-Stones," she strikes a fairly searching chord:

We are the paving-stones;
Over our ancient hones
The restless people pass—
Over our patient hones
As breezes over the grass.

Endlessly to and fro
Man and woman and beast,
Hither and thither they go,
Beating to west and east,
Beating to east and west,
Like ships on the ocean's breast.

Some of them laugh in glee,
Some of them weep in woe;
Over our rattling hones,
On, with their moans and groans,
On, with their laughter free,
Over and over they go.

Brides all smiling and fair
Pass in their bridal white;
Babes that wonder and stare,
Men that have died that night,
Lovers whose hope is bright,
Lovers who know despair.

Men of a thousand fates,
Women of countless aim,
Each with his loves and hates,
Famed, or without a name;
Some that luxury know,
Some that hunger for bread,
Over and over they go,
Living and dying and dead—
Over our ancient bones,
Bones of the paving-stones,
As breezes over the grass
The folk of the city pass.

"A Modern Chemist and Other Poems," by Lee Wilson Dodd, stands out from the flood of poetry published by Badger, with something of distinction. There is brain work behind Mr. Dodd's verse, and poetic information. His reading is apparent in his work, but it is reading of an admirable variety, embracing such disparate writers as Landor and Dante, Browning and Beddoes. There is at present a certain overemphasis in Mr. Dodd's phrasing which blunts his fineness, and he has as yet imperfectly realized the vital truth that poetry is a fine art resulting in an objective product, as well as a means for turbulent self-expression. But there is a vigorous body in his work which makes the reader hopeful for its future growth. This nobly conceived, but somewhat jolting, sonnet to Carducci, presents Mr. Dodd at his average level of poetic attainment:

Carducci, hail! Hail, pagan poet! None
Has better loved the laughter of the sun,
Has better loved the earth's abundant breast,
Whereon the opulent summers sink to rest
Reluctantly, one after one, and thence
Draw the rich fountains of their opulence!
Your nature is like summer, ample, free
(Hail singer of the heart of Italy!)
From winter's chill secretive sophistry;
Winter, who frights us for a little space
By drawing death's white veil before his face,
Who thwarts the sun with shadow. . . . You
are not one

To fret with vapors the impetuous sun!
Life, life's abundance, these you still proclaim:
And life seems lordlier when we name your name!

A rather notable aspect of the recent outburst of poetic drama has been the frequent occurrence of Hebraic subjects—David, Herod, Saul, Judith, have all been made the theme of romantic plays in verse,

and now Richard Burton has dramatized with considerable success the brief story of the harlot Rahab as it is told in two chapters of Joshua (Henry Holt). As a criticism of life the play is not conspicuous, for with the exception of Rahab herself, the characters are but outlines, and even in her case her abandonment of her evil courses through faith in the warlike God of Israel and her subsequent love affair on a high plane with one of the Israelitish spies are not very convincingly conducted. Indeed, the introduction of the love motif weakens the artistic vitality of the story as it is in the scriptures. Yet if the play lacks sufficient vigor to foretell for it length of days it has some qualities that are uncommon in contemporary verse. It is devoid of surplusage and bombast, its "sentiments" are often moving, and its backgrounds always picturesque. It is written in admirably workmanlike blank verse.

Another play from Christian material is "Augustine, the Man," by Amelie Rives (Princess Troubetskoy). This is a closet drama of the extreme type, only dramatic in that it is conducted in dialogue, though place is given to soliloquies of some hundred of lines. The theme of the play is the humanizing of the religion of Augustine through the death of his son, Adeodatus, whom, in the first ardor of his reformation, he had renounced along with his oldtime mistress, Melcara. The piece is written in fluent and highly flavored verse, and is not devoid of a good deal of an Euripidean poignancy.

THE BATTLE OF REASON AND FAITH.

The History of English Rationalism in the Nineteenth Century. By Alfred William Benn. 2 vols. New York: Longmans, Green & Co. \$7 net.

Leslie Stephen closes his survey of "English Thought in the Eighteenth Century" with the significant words: "I have reached the opening of a new period in the history of thought; and here I must pause, without even venturing to cast the most perfunctory glance upon later developments." Mr. Benn's two volumes may be taken at once as a rival and a continuation of the work thus brought to a close. Though the use of the word "rationalism" in his title might seem to indicate a narrower purpose than Sir Leslie Stephen's, this does not prove to be really the case; for "thought" in the preceding century was pretty well confined to the wavering conflict between reason and faith which Mr. Benn takes more frankly for his theme. The point of view of both writers is the same, and their literary methods are not greatly dissimilar. The chief difference is that, where Sir Leslie attacks the opponents of rationalism with irony and dry humor, his successor uses the heavier but less effective bludgeon of contempt. Apart from greater literary cunning, it cannot be said that the victory is always with the earlier writer, and this comes out emphatically in a comparison of his work with Mr. Benn's third and fourth chapters, which by way of introduction run through the history of the eighteenth century. In one particular, indeed, Mr. Benn has a decided advantage; his knowledge of the classical sources of philosophy is far deeper than Sir Leslie's, and it is,

perhaps, owing to this that he succeeds in presenting such an author as Shaftesbury in true light, where Sir Leslie might have been expected to show his superiority, but where in reality he has gone all astray. Shaftesbury's "strongest antipathies are excited by that ugly phenomenon which our ancestors condemned under the name of enthusiasm," says Sir Leslie. That no doubt is the negative side of the "Characteristics," but without some such corrective as the following from Mr. Benn it quite misrepresents one of the most influential of English writers:

That enthusiasm from which even the cultivated Addison shrank with alarm was shown by the far higher culture of this young patrician to have no necessary connection with sour faces and narrow conventionalities. Greek in origin, it had been recognized by Greek philosophy as the secret of every great achievement in statesmanship, in creative art, and in speculative thought.

It is a pity that Mr. Benn glides so hastily over Bolingbroke, the other philosopher who quite escaped Sir Leslie's logical net.

Elsewhere, in dealing with such a work as the "Analogy," Mr. Benn becomes confused and loses his guiding thread. "Butler, and it is the great secret of his power," says Sir Leslie, "is always depressed by the heavy burden of human misery and corruption." It is because Mr. Benn has little imaginative sympathy with all this side of human nature, because his interest, so much more than Sir Leslie's, is bound up with the single faculty of the reason, that his work as a whole falls below its predecessor. In the wider sense of the word he fails through inability to mark literary values. The *homo rationalis*, as Mr. Benn himself remarks, is a pure abstraction, and it is the distinction of literature that it never forgets this fact, whereas in the last analysis Mr. Benn deplures, if he does not actually ignore, it. Here, however, the fruitful comparison is not with the work of Leslie Stephen, but with such a history as Sainte-Beuve's "Port-Royal," where a religious and philosophical controversy is made part of the presentation of a whole civilization, and reason is properly related to the other faculties of man. Such a comparison shows how much nearer to the truth literature may approach than pure philosophy.

In the end this literary criticism must be directed against each of the two main parts of Mr. Benn's work, between which the survey of the eighteenth century lies as a kind of interlude. His first task is to analyze that conflict of reason and faith which he is later to follow historically, and here it would be hard to overpraise the subtlety and clearness of his argument. He does not veil his thesis. "Rationalism," he states frankly, "is the mental habit of using reason for the destruction of religious belief." His subtlety consists in showing how religious belief, or faith, shifts from one stronghold to another as it is attacked by reason. He begins with authority, which, under the form of a principle consciously entertained, is the oldest, the most widely diffused, and perhaps even now in the most advanced communities the most potent of all. At first this principle is obeyed unquestionably, but later there comes a time when these authoritative dicta are found to be at variance with one another or with the lessons of accumulat-

ed experience. The *quod semper, quod ubique*, is discovered to have endured but a little while, over a small portion of the earth. Driven from this outwork, faith makes its next stand in mysticism. All corporate feeling, whether evoked by family, school, army, city, country, or any other community, tends toward a personification through which the surrendered life of the component parts is returned to them in an enlarged and purified expression. "The peculiarity of communities constituted by identity of religious belief lies in their power of converting that belief into what we call faith, that is a belief held, if need be, against reason by virtue of a higher evidence than reasoning on facts of observation can afford. And this higher evidence is simply the self-consciousness of a creative act, which, in the words of the great Italian philosopher Vico, knows what it makes." The sense of communion is lifted up into an assumption of unity or contact with deity. But this very act carries with it a principle of anarchic and dispersive individuality destructive of the sense of community from which it springs. Skepticism follows, and this, too, becomes a bulwark of faith. A man knows nothing, and can know nothing; yet he eats and drinks, shows decided preferences, and exchanges information with his associates. All this, he tells you, is done by habit. Why, then, not go a step further and accept the prevalent religious dogmas as probably the safest, and certainly the easiest, course? This revulsion to faith through intellectual apathy may seem distinctly modern; as a matter of fact it is very old, and may be seen in the later schools of Greek philosophy and in their Roman disciple Cicero. But so obvious is the weakness of skepticism as a support to religion that commonly it merely serves to prepare the way for that last resource of struggling faith, the appeal to results. Here Mr. Benn feels compelled to create a new word to convey his meaning, and, as the term is really a valuable addition to our philosophic vocabulary, we may quote his explanation at some length:

For this, which I have called the method of appeal to results, there is no name in the English or any other language known to me, no single word answering to the three words traditionalism, mysticism, and skepticism, each of which sums up in itself a whole philosophy of faith. In these circumstances I propose with all diffidence to coin a new technical term; and Ophelism suggests itself to me as the most suitable that can be devised. It is formed from the Greek *ὀφελος*, "use," and therefore has etymologically the same force as Utilitarianism, a word that would have answered our purpose had it not been already appropriated as the denomination of a well-known ethical system, the system of those who hold that the ultimate end of action should be to promote the greatest happiness of the greatest number. Ophelism, on the other hand, has to do with belief rather than with action, or with action only so far as it is determined by and justifies belief. But there is this much resemblance between the two, that ophelism, in at least one of its forms, measures the truth and falsehood of propositions by the same standard that utilitarianism applies to the value of actions, in other words, by the amount of pleasure or pain that their acceptance is calculated to produce.

This "ophelism" may be intellectual, corresponding to the mental attitude of those who hold that certain propositions, otherwise unproved, must be accepted because

their rejection would involve the surrender of other propositions which we are bound to believe; or it may be ethical, springing from the fear that morality would perish without the belief in God and the control of the church. This last appeal to results is also, according to Mr. Benn, doomed to failure, less from its logical irrelevance than because it exhibits with such startling clearness the essential incompatibility of the religious with the ethical ideal. In the end ophelism, like mysticism and skepticism, tends to resolve itself into a mere reliance upon authority, and we are thus brought round in a vicious circle.

It is in one sense, of course, a grave injustice to reduce a chapter of minute and powerful logic into so bald a summary, yet in no other way could the basis of Mr. Benn's history be laid bare. What he fails to perceive is that this very elusiveness of faith before its enemy reason shows that it is founded in a psychological *quod semper* of vastly greater force than the appeal to authority as that is commonly understood. He forgets that the *homo rationalis* is a mere abstraction. Reason may dissolve the forms which religion assumes and re-assumes; it has no hold upon the faculty which creates the necessity of religion. As the greatest of Mr. Benn's masters, David Hume, once wrote: "What peculiar privilege has this little agitation of the brain, which we call thought, that we must thus make it the model of the universe?" Mr. Benn's rationalism falls ultimately as an argument because it is insufficiently literary, because, that is, it fails to blend and consider together the whole intellectual, imaginative, and spiritual nature of man.

And this same defect is displayed even more evidently in the main portion of the book devoted to the actual history of rationalism in the nineteenth century. It is, considering the purpose of the work, a relatively small matter that the distinctly literary judgments scattered here and there are feeble, if not perverse. Yet, even in a treatise, professedly rational and un-literary, we are a little shocked to find Walter Scott described as one who worked up romantic materials into classic forms, and are a good deal more shocked to read that Wordsworth could at no time in his life be identified with the romantic tendency. To misconceive the philosophy of romanticism so totally argues some considerable misconception of the springs of human nature. Nor does the arid and flipbrant chapter on Tennyson's mysticism bring reassurance. We are not surprised, therefore, to find a certain insufficiency in the chapter on the philosophy of Coleridge, which opens the reactionary movement of the century. Mr. Benn dissects the inconsistencies and waverings of Coleridge's metaphysical system, or lack of system, with merciless vigor. All this is well and legitimate. But it seems to us, nevertheless, that a still higher criticism would find a striking unity—or shall we say imaginative tendency?—underlying all of Coleridge's intellectual vagaries. It is this latent and sub-intellectual unity which gave him so much weight with his own generation and the generations that immediately succeeded; and just because Mr. Benn fails with his rationalistic plumb-line to reach that

deeper stratum of Coleridge, he misses in part also the profound influence of his philosophy. Prof. Goldwin Smith was nearer the truth when he said that "Coleridge rather than Butler has been the anchor by which the intellect of England has ridden out, so far as it has ridden out, the storms of this tempestuous age."

On the other hand, where no other instrument is needed than Mr. Benn's shrewd rationalism, his argument often attains something like finality of persuasive clearness. We have never read anything better in its kind than the pitiless logic which is brought to bear on the inherent inconsistencies of Spencer's synthetic philosophy. Perhaps our admiration here has something of its etymological sense of wonder, for we should have expected to see Spencer treated more as a friend of the rationalist and less as a lurking enemy. It would only be fair to a work for which as a whole we have a very high regard, however much we may differ from its conclusions, if we were to draw copiously on this section concerned with the synthetic philosophy. But to summarize Mr. Benn's close argument, would he to weaken its force, if not quite to distort it. We must be content to refer the reader to the chapter itself, as indeed to the whole history of the Protean battle of reason and faith throughout the nineteenth century. The discussion is necessarily far less simple than Sir Leslie Stephen's account of the eighteenth century, and its dramatic unity correspondingly weaker; but it has a richness and variety that are not without their compensating interest.

A GREAT HUNGARIAN VIOLINIST.

Edouard Remenyi. By G. D. Kelley and G. P. Upton. Chicago: A. C. McClurg & Co.

No one can read this volume on and by Remenyi without regretting sincerely that the eminent violinist did not live to carry out his intention of writing his memoirs. The specimens of his letters included in it justify the characterization of his mis-sives by one of his friends as "intensely interesting," and several of his essays are remarkably well written, as well as suggestive; whence we may infer that the story of his life from his own pen would have been a volume to treasure. However, what Gwendolyn Dunlevy Kelley and George P. Upton have written and collected makes an acceptable substitute; a volume which is much more than what they call it—"the skeleton of a work that might have been." Beside their own sketches of the artist, they have gathered reminiscences of the violinist's wife and half a dozen friends; tributes to his genius from the press; a collection of anecdotes; fourteen essays; and selections from the correspondence with Robert G. Ingersoll and other friends. There are also ten portraits.

Although Remenyi was born in Hungary, we might almost claim him as an American, for he was barely twenty when he first visited this country; it was here that he won many of his greatest triumphs; it was American life and scenery that inspired his best essays; and he died in San Francisco. He was of Jewish descent, his father's name having been Hoffmann, which

the son Hungarianized to Remenyi. His coming to the United States at so early an age was for political reasons. In life as in art he was always an ardent Hungarian, and his patriotic fervor was aroused, in 1848, by the uprising against Austria organized under the leadership of Kossuth. He wanted to be a soldier, but Gen. Görgey would not allow him to go to battle because he considered his violin a mightier weapon than the sword; so Remenyi was asked to encourage the soldiers to action by playing patriotic battle airs, which he did with surprising success. He played not only in camp, but went from village to village, arousing the inhabitants with the Racokzy march, with such tremendous effect that the Government became alarmed and issued an edict forbidding his playing with this purpose, under the penalty of death—surely one of the grandest tributes on record to the power of music. He refused to stop, but was at last compelled to flee.

Having little money, he came to America in the steerage. His first concert was given at Niblo's Garden, on January 19, 1850. Six months later he returned to Hamburg, where he made a remarkable discovery, which was nothing more or less than—Johannes Brahms. Schumann is the man who usually gets the credit of having discovered that composer; but to Remenyi belongs the honor of having been the first to recognize his ability and to introduce him (to Liszt) as a new genius. Brahms was at that time giving lessons in Hamburg for fifteen cents an hour. He was sent as a substitute for Remenyi's regular accompanist, who happened to be ill; and the violinist was so much impressed by his playing that he engaged him at once. So the two travelled together, paying their way by giving concerts at various places. To Brahms this association proved of incalculable value; for while Schumann's proclamation of him as the new "musical Messiah" called the attention of professionals to him, it was through his "Hungarian Dances" that he first came into vogue as a composer; and for these dances he was indebted to Remenyi.

The account of this affair given to the world by Remenyi (op. 82-95), after a silence of twenty years, does not show Brahms in a noble light. While the two were travelling, Remenyi used to kill time in the hotels at night by playing and composing Hungarian airs. These he submitted to Brahms, in whose judgment he had great confidence. Great was his surprise, in later years, to find his own melodies, with others well-known in Hungary, attributed to Brahms, who did not mention in the score the sources of his "Hungarian Dances." It was for this reason that the violinist never played the "Brahms" Hungarian Dances. He even had reason to fear that, had he played them, the public might have thought, to cite his own words, that he was "not playing them in the right way, inasmuch as they have been accustomed to hearing them given in a style totally different from my own, although I think you will concede that I ought to be the best judge of the manner in which my own compositions should be performed." Other composers have appropriated the Magyar airs of Remenyi as folk music (as they have the melodies of Grieg); and Mr.

Upton remarks that "if his Hungarian compositions and arrangements could be collected and carefully edited they would prove an important addition to the music of that nationality." A partial list of his pieces and arrangements is printed in the Appendix.

When Remenyi returned to Hungary the second time (in 1891; the first time was in 1860) he was, his son relates, "greeted with a reception very much like the one Admiral Dewey had on his return to America. I was with him then. Soldiers lined the streets from the depot to the hotel, and my father had to make speeches. I saw an old man at a way-station shake him by the hand and say that now he had seen Remenyi, he could die happy." This enthusiasm over him had two sources—remembrance of his youthful help in the war and pride at the honor he had since shed on his native country by his art and his success in familiarizing the whole globe with Hungarian melodies and the true Magyar way of playing them. He was one artistic globe-trotter *par excellence*. There are records of him in Egypt, Australia, Japan, China, Java, the Philippines, India, Ceylon, Madagascar, South Africa, and nearly every other corner of the globe. There would be long silences regarding his whereabouts, followed by lurid reports of shipwrecks, capture by cannibals, and assassination; but, fortunately, as in the case of Mark Twain, the reports of his death were always "grossly exaggerated."

Every one has read of how he played one day on the top of the Pyramid of Cheops. In India he played for native princes, and heard their musicians in return. In our own country he appeared at symphony concerts with Anton Seidl, but that did not prevent him from subsequently playing medleys of American airs at Colorado mining camps. On one of these occasions, when he was completely exhausted, after repeating his patriotic medley three times, the audience became a howling mob demanding more, standing on stairs, and demolishing the furniture. His last appearance was at the Orpheum Theatre in San Francisco, where there were similar outbreaks of frenzied enthusiasm. They proved too much for him. His physician had advised him not to play, but he disregarded the warning. He had just begun a new piece when he fell forward, unconscious, thus fulfilling his own prediction to a friend: "I shall die fiddling."

If we inquire into the cause of Remenyi's remarkable power over vaudeville audiences on the one hand, and such great connoisseurs on the other as Anton Seidl and Carl Schurz (who, when Minister of the Interior, once presented him with a watch, the case of which was inlaid with twenty-florin gold pieces of Kossuth's money of 1848), we shall perhaps find it chiefly in the facts that to him music was an actuality, not a mere accomplishment, and that he had a unique and fascinating personality. In the war of 1848, he learned to know the power of music as something infinitely more than a mere diversion; and such it remained to him all his life. "Art possesses me entirely," he wrote in one of his brief essays. "With me it is not an agreeable pastime; it is my life, my blood, my everything." And he played like one of whom this was true. How utterly unconventional his performance was

we realize from such remarks by himself, his friends, and the critics, as these: "I always improvise my variations before the audience, never playing them twice alike, and, before commencing to play, generally commend myself to the good will and charity of some musical guardian angel not to leave me in the lurch." Remenyi was impatient of any break in the stillness of a room in which he was playing, and often he would wander back and forth, his instrument in hand, his music growing fainter and fainter, as he moved farther away, and swelling as he returned, perhaps, to lean against a table or a chair, playing with eyes all but closed." Apparently absent-minded, "he rarely seems to realize that an audience is in front of him until he is awakened as from a dream by the applause."

With his complete tonsure, he looked so much like a priest that once, at a Colorado camp, a miner called out: "Hello, old man! give us your blessing first!" He was as abstemious as an anchorite. To his vegetarian diet he attributed his remarkable vigor, firmness of muscle, and strength of arm. It is to this peculiarity that Col. Ingersoll referred in a note, dated December 27, 1897: "This is letter No. 2. I forgot to say in the first that we would have baked apples, milk, and bread like the soles of shoes. You can get fat. Apples and Art, Bran and Brain, Milk and Music—what a blessed Trinity!" Remenyi's own letters are a quaint mixture of languages, puns, colloquialisms, superlatives, fun, and enthusiasm. Of his essays, the one on "Popular Music" is to be commended particularly. Two sentences will show its drift: "What beautiful strains we possess in his [John Bull's] glees, madrigals, merry songs, and jolly, jolly hornpipes! Don't laugh—those hornpipe dancing tunes are very fine, a thousand times finer and better than thousands of pale-faced uncharacteristic compositions of our own day." In "American versus European Civilization," he takes issue with those who disparage our country, so far as the people are concerned; and in "Love of Natural Scenery," he waxes eloquent over our Indian summer foliage and our mountains: "A Rousseau, a Dupré, could have painted in these valleys for fifteen thousand years, and could only have been at the beginning, just as Calame could have gorged his unquenchable thirst for glorious wild rocks and alpine grandeur in Colorado, New Mexico, and in some parts of Arizona for ages"; remarks which help to explain Remenyi's power over his audiences.

The Revival of Aristocracy. By Oscar Levy. Translated by Leonard A. Magnus. London: Probsthain & Co.

Prophets are wont to be hopelessly out of joint with their times, and men of genius are often difficult of comprehension to their contemporaries; but it is also true that a man may easily be both difficult of comprehension and out of joint with his time, and yet be neither a prophet nor a genius. We fear that this is the situation with Dr. Levy, if indeed he really means what he says. In his main thesis he is plain enough. Our modern civilization is a gloomy swale of inanity into which humanity has sunk through the mawkish Christian notion of

human brotherhood and equality. Napoleon aimed at the revival of aristocracy, but the age was too paltry to recognize and grasp the hand held out to it. Napoleon passed, and the flood of triumphant Christian Democracy swept over the world unchecked. "For the first time in the world's history Christianity was not only believed in (which is comparatively harmless) but practised and made real." The common people, under the fructifying sunshine of this universal love, married and multiplied, and being now without their natural aristocratic leaders fell into strife among themselves. "Everywhere the weak met the weak in combat, crowding, scuffling, hot, and angry; and, thanks to the prevailing principle of humanity, the weak ever multiplied and increased, and with every decade their leaderlessness became greater." The abdicating aristocrats, instead of clubbing the herd down to its proper level, even contaminated their gentlemen's blood by marriages with their servants, and naturally "European noses grew flatter, foreheads narrower, the ironical smile became rarer, eyes smaller, glinting more craftily, and with less divine composure." In place of that peace which consciousness of an ideal (the aristocratic ideal) confers on man came "neurasthenic spasms, an atmosphere of haste and scurry." So much have the pitiable virtues of Christianity done for the world!

But into this Cimmerian darkness three genial sunbeams have penetrated—Stendhal, Goethe, and Nietzsche. If it does not seem natural to classify Goethe with the other two, that is because the cat was too cautious to display his claws unnecessarily. "Goethe was an expert hypocrite, borrowing from cats their noiseless step, and concealing his carnivorous nature under a prudent sheepskin—*vulgo*, ministerial coat; clad in which, and bedecked with orders, he used to promenade about like an ordinary man." Goethe died, completely misunderstood by every mortal of his time except Heine, and after his death "an atrophy of intellect in history unparalleled seized upon Europe." Men jargoned of the altruistic life, and blamed their unvirtuousness "if two doses a day were not swallowed of the bitter medicaments, self-sacrifice and self-denial." And then the third gleam of a possible daybreak came in the form of Friedrich Nietzsche. Changing the figure, with our author, "the voices of Stendhal and Goethe have been only as the mumbling under earth of spirits of a healthier epoch long bygone; with Nietzsche the volcano shot up, and over the crosses and cloisters and torture-chambers of Christendom there burst the glowing lava-stream of heathendom, fated to sweep away the ancient civilization, ready to rebuild a home for a happier posterity." The author's faith in the success of this summons to a revived and happy heathenism wavers somewhat. Protestantism, democracy, industry, are nowadays triumphant all along the line, and with the Germans and English so deeply rooted in these Teutonic virtues there is little hope from the North. There, "a solitude called civilization could be made; but in Italy, to her good luck, heathen passions have never been entirely uprooted." And again, "To this wondrous people's eternal glory, they never through all the ages of Christendom have taken Christianity seriously. . . . In Italy

heaven was not deemed worth earthly buffings, nor the Christian faith a dagger thrust. The Italian stabbed to satisfy himself and not his God." And so Italy, building on Stendhal and Goethe and Nietzsche, may take the lead in "conferring on men more strength and mirth through more suffering; that the feeble may go to the wall and the strong find either slaves they can command or opponents worthy of them, on whom to steel and test their strength." But we have gone perhaps farther than necessary in the effort to give adequate samples of the substance and quality of Dr. Levy's book. The translation is dedicated in a special preface to the English, who are quizzically advised not to read it and assured that if they do they will most likely altogether misunderstand it. The desire to stir up a storm is evident on every page, but there is little indication that the key to the cave of the winds is in the author's hands.

The Constitutional Decisions of John Marshall. Edited, with an Introductory Essay, by Joseph P. Cotton, jr. Two vols. G. P. Putnam's Sons. \$10 net.

This is an elaborate study of Marshall's judgments, designed for both laymen and lawyers. It is a complete collection of all his decisions, both in the Supreme Court and on circuit, and is therefore fuller (though not, we think, better) than John M. Dillon's collection published three years ago, and annotated by himself and John F. Dillon. In both books the notes take the form of legal, critical, and historical essays on the text of the decisions, so that the reader is furnished with a gloss or comments of a valuable sort. The present volumes are the work of a lawyer who has aimed at popularizing his subject; we should be very glad to think that he had succeeded, for a United States in which these decisions should become widely studied and read would certainly be an extremely enlightened and probably soon an exceptionally well-governed country.

Marshall's decisions, however, important and enduring as they are, do not lend themselves to the attempt. They are too strictly legal to be capable of complete comprehension save by lawyers and publicists trained in this special field, although here and there the principles laid down, as in the case of the great rule on the subject of the obligation of contracts, and the control of the judiciary over unconstitutional legislation, have become matters of common knowledge. They can never be made a hand-book of the Constitution like the "Federalist" (essays written for a popular audience). They are the decisions of a very great judge, who had the good fortune to be able to develop and expound a new branch of jurisprudence. Marshall did this for American constitutional law as Sir William Scott did it for a great branch of international law; and as his subject involves the most important legal questions of government which can engage the attention of statesmen and publicists or affect the public welfare, so his judgments must always be, for us, those of our greatest judge. But they appeal to the enlightened reason and conscience; there is little in them to touch the fancy or arouse the curiosity of the general public. What can be done to make them intelligible by and commend them to the at-

tention of that public, the present editor accomplishes by means of very readable historical notes, which bring before us dramatically the men, the times, and the situation. This critical study of the decisions presents an analysis of Marshall's exposition of the Constitution, proving and carrying on, to use his own language, "the opinions of the late Prof. James Bradley Thayer, of the Harvard Law School, who more than any other man of recent years has contributed to the better understanding of Marshall's genius."

For this technical criticism we must refer the reader to the book. It does not seem to us to throw any distinctly new light on what Marshall did, and, indeed, the editor seems to regard that as practically impossible. The new light in which he has himself made his studies seems to be that of the recent decisions of Marshall's court in the "Northern Securities" and "Insular" cases; and while fully agreeing that this may fairly be done, we are inclined to doubt whether a patriotic bias has not led Mr. Cotton to find in those decisions a radiance and illumination where others of high authority have found a discouraging obscurity. At any rate, it seems going pretty far to say of Marshall's general language in *McCullough v. Maryland* on the subject of implied powers, that it is the "judicial warrant" for "the power of our Presidents in grasping and establishing colonial empires."

What may be called Marshall's system really consisted of two parts, which have, at bottom, very little to do with one another: first, the subordination of State authority, wherever it conflicted with the constitutional power granted to the central authority (Federalism); second, the subordination of the Legislature to the Judiciary as the final arbiter of constitutional questions. One was political; the other legal—the great underlying principle of American constitutional law. The views of Marshall relating to the first subject proved completely triumphant. Of the old States-rights theories hardly a vestige is left. In his efforts to establish the second he was by no means so successful: the Dartmouth College case is still accepted as law, but the principle of the decision is so hedged about with qualifications and limitations that it has grown to have less importance to-day than any one would have dreamed possible fifty years ago. The development of the "police power" in the last fifty or sixty years has given all legislatures a weapon of the most formidable sort in their struggle with the judiciary.

We are inclined to think that much confusion would be avoided if commentators in future would endeavor to keep the line between these two parts of the system of Marshall distinct, and that, once clearly traced, it would show that there is no evidence for the opinion that the principles of Marshall's decisions are logical props for an omnipotent Congress. The recent decisions giving Congress plenary power over the "colonies" did not raise any of the old States-rights questions at all; they turned on the power of the Federal legislature under the Federal Constitution. Would Marshall have held that Congress could lay duties on articles imported from the Philippines, in the face

of a clause in the Constitution requiring that "all duties . . . shall be uniform throughout the United States"? There was nothing in his Federalism which would have prevented him from denying to Congress any such power, and Loughborough vs. Blake looks very much as if he would have denied it, as the other theory underlying his system would have inclined him to do.

If the line which separates those of Marshall's decisions directed against the old doctrine of States-rights from those dealing with the fundamental questions of property, contract and common constitutional right, against which legislative attacks are generally directed, be kept in view, he will, we believe, always be found in the latter the staunch enemy of the encroachments of any legislature, as he was in the former the constant supporter of the supremacy of the Federal authority. If this be true, no effort to make him responsible for those theories of constitutional law which give Congress the power to "extend" the Constitution or at its pleasure to withhold it from territorial possessions, will be successful.

The Babylonian Expedition of the University of Pennsylvania. Vols. XIV. and XV. Documents from the Temple Archives of Nippur. By Albert T. Clay. University of Pennsylvania, Philadelphia. 1906.

Somewhere about 1700 B. C. the Cassites or Cossæans, from the mountains eastward of Babylonia, overran and conquered the latter country and established there a dynasty which is said to have reigned 576 years. The University of Pennsylvania expedition to Babylonia discovered at Nippur large quantities of documents belonging to these Cassite rulers, of whom up to that time very little had been known. The first considerable discovery of documents of that period was made during the second campaign, 1889-1890. Some 300 complete tablets and a large quantity of fragments, all baked, were found buried in the ground, just outside of and beneath the level of a very interesting building, about the origin and date of which there has been considerable controversy, the palace of the Court of Columns. These tablets were identified as archives, containing records of payments for the temple service, etc. Later in the same campaign large numbers of tablets of the same period, chiefly unbaked, were found at other places, and in the later expeditions apparently still larger numbers of tablets, mostly unbaked, of the same general period were discovered; the whole constituting an amount of material of very considerable proportions from a theretofore almost unknown period.

The 363 tablets and fragments of tablets published in these two volumes cover the reigns of eight kings, extending over 131 years, in the fourteenth and thirteenth pre-Christian centuries. Most of these tablets are derived, Dr. Clay tells us, from the original discovery described above. These were clearly identified as temple archives. He says further: "Owing to the unfortunate fact that the provenance of much of the material excavated at Nippur is not known, there are some tablets here published which doubtless did not belong to the official archives, discovered in the northern or southern sections of the city, but are of a

private character" (vol. xlv., p. 2). It seems to us regrettable that those whose provenance is known and which came from a certain definite collection found in a certain definite place, which constitute the great bulk of the tablets here published, should not have been indicated by some mark which would enable the student to identify them.

In the introduction we find a very brief discussion of "a few points of historical importance which have come to light through the study of these documents" (vol. xiv., p. 3), viz., "the number of years that each king here represented reigned according to the dating of the tablets," the correct name, Kadashman-Bel, of a certain disputed king, and the meaning of a certain title. But these are rather points of historical unimportance. Surely Dr. Clay must have derived more historical material of greater importance than this for the Cassite period from his study of the tablets published in these volumes and the hundreds more collated by him. One obvious historical value of dated tablets is to establish or correct chronology. Now in vol. i., part i., of this series of publications Professor Hilprecht gave a chronology of the last twenty-four kings of the Cassite dynasty, of part of which he somewhat characteristically said that it "must be regarded as absolutely correct." The dated tablets in these two volumes fall almost entirely in this part, and neither as to names of kings, order of succession nor length of reigns do these seem altogether to agree with Professor Hilprecht's list. We certainly should have expected, in the discussion of "a few points of historical importance" in the introduction to the publication of these Cassite tablets, something about the light they throw on the chronology of that period.

While these volumes are numbered xiv. and xv. they are really only the fifth and sixth of the series of texts from Nippur. The first volume, by Professor Hilprecht, the publication of which began in 1893, contained old Babylonian inscriptions from 3000 to 2000 B. C. Then followed in 1898 vol. ix., "Business Documents," of the years 464-424 B. C., by Hilprecht and Clay. Six years later, in 1904, appeared vol. x., "Business Documents," of the years 421-404 B. C., also by Clay. In the current year we have part I. of vol. vi., by H. Ranke, and vols. xiv. and xv., by Clay, all covering periods in the second millennium before Christ. In thirteen years there have been published six volumes of the texts found at Nippur. We are glad to see that the rate of publication is being accelerated.

These volumes follow the same scheme as the preceding volumes of this series. The main body of the work consists of a very careful facsimile pen and ink copy of the texts of the tablets, seventy-two full-page plates in each volume, with a dozen or fifteen plates of photographic reproductions. To these are prefixed tables of contents, concordances of proper names, lists of signs used and introductions dealing with various matters of interest, the introduction ordinarily containing a few transliterations and translations of specimen texts. And precisely here it seems to us that the editorial scheme of the series is faulty, in comparison, for example, with the publications of the French exploration in Susa, which, al-

though appearing with great promptness, contain transliterations and translations of all the texts published.

The Cassite tablets, it must be frankly admitted, are not in themselves documents of general interest. They are records of taxes, or rather rates collected, loans made, receipts for seed, cattle, grain, etc., and salary receipts from various temple officials, material to which only an expert hand can impart the form of life. One or two are pay-rolls, lined perpendicularly for the months (in one case for a whole year, with divisions into two periods of six months), and horizontally for the names and official positions of the persons on the pay-roll. In a list of payment of grain and dates as temple stipends for twelve months during the thirteenth year of Nazi-Maruttash there are forty-six names on the pay-roll. Of these four are marked as *harranu*, "on the road," or absent by permission or on business and receiving no pay. Three, against whose names no payment is entered, are marked as dead. Three "bread-grinders," one "gateman," and a woman, who is described as some one's daughter, are marked as *HA-A*, which Dr. Clay supposes to mean *halqu*, "fugitive." There are two more names with no payment attached and no explanation given. In all, out of the forty-six persons, fourteen for various reasons draw no pay. In some cases whole families appear on these pay-rolls, it would seem as though of hereditary right; and *vice versa* it would seem that the temple had an hereditary claim on them, and that they were bound to its service without their own consent; hence the "fugitives." The titles of many of the officials are not clear. In fact we as yet know very little about the organization of a Babylonian temple. It is clear that the system of administration was very highly developed. There was a huge army of functionaries and employees. The temple was a great corporation, owning lands, houses, and cattle, and engaging in industries. But Dr. Clay has not been able to interpret his material in such a manner as to throw new light on the methods of organization and administration.

The amount of labor expended on these volumes, both in the exact autographing of the text and also in the careful examination of all sorts of details, is enormous. Dr. Clay has made a series of experiments to determine the precise form of the stylus and the way in which it was used. He has experimented on the manufacture of case tablets to determine how the envelope of clay was placed over the interior tablet. He has shown that many tablets found without envelopes were originally "case tablets." When payment was made, the envelope was broken, but the inner tablet preserved for record. In minute and painstaking labor Dr. Clay excels. His autographic copies of the tablets leave little to be desired. His carefully garnered lists of proper names, place names, names and epithets of deities, contain material of much value to future students. In the broader field of the interpretation of the tablets and their utilization for chronology, for history, to reveal the life of the men who wrote them, the field of the introduction, his work is disappointing. We regret to have to add that the style is involved and cumbersome; the

actual meaning of a passage is often difficult to determine; and some sentences are absolutely ungrammatical. There are also several mistakes due to careless proof-reading. The mechanical execution of these volumes is, as in the case of the previous volumes, irreproachable.

Cultes, Mythes, et Religions. By Salomon Reinach. 2 vols. Paris: Ernest Leroux.

Under the foregoing title, which is almost a translation of the title of one of Andrew Lang's most familiar books, Salomon Reinach has brought together in two volumes seventy of his essays and reviews dealing with the history of religions, and a third volume of similar character is promised. Although the work consists entirely of republished materials (in some instances revised and brought up to date), it deserves more than passing notice. The articles, originally scattered through a number of literary and technical periodicals, are bound together by a unity of subject and method and constitute something like the chapters of a coherent treatise. If they occasionally repeat one another, they also confirm and illustrate one another; and the two prefaces supplement them all by a brief general exposition of the religious theory of the author. Thus it is more than a mere matter of practical convenience to have the essays in a single work. The material, it is hardly necessary to say, is of great interest, for the learning and acumen of M. Reinach are familiar to students of all branches of archaeology, and the present collection only brings new and impressive evidence of his extraordinary productivity. He disavows all claim to originality for his general theory and method, and declares himself a follower of the English anthropological school. He acknowledges particular indebtedness to MacLennan, Tylor, Lang, Frazer, and Jevons, and most of all to the late Prof. Robertson Smith, to whose memory the work is dedicated. In the introduction to the first volume he describes his efforts to spread the knowledge of their work among Continental scholars, and he makes the surprising statement that in the year 1900 Mommsen had never heard of a totem.

M. Reinach's own doctrines are in some respects more "totemistic" than those of his masters. Andrew Lang, for example, has taken exception to his explanation of the Christian communion as a survival of the totemistic feast, and to his theory that the domestication of animals was a result of their preservation by a religious "taboo." In support of the former opinion, which M. Reinach really based upon Robertson Smith, interesting considerations are urged in the chapter on the death of Orpheus in the second volume, but the evidence is still far from complete. With regard to the domestication of animals, M. Reinach appears to us to invert the relation of cause and effect. His theory, however, is consistent with his whole conception of the preëminent importance of religion, or of the magic which represented it, in the life of primitive man. Religion, and not utility, he maintains, lay behind the development of all the practical arts. Primitive piety, and not necessity, was the mother of invention. The discovery of fire, the working of metals, and the culture of cereals, as well as the domestication of animals, he would attribute to the

priest or magician. Rationalism itself, which he declares will ultimately supplant religion, was at first a product of it. Starting with this fundamentally religious, or superstitious, state of society, he defines the history of mankind as a progressive "laicization," which is still far from being accomplished, and in a few vivacious pages of his second preface (volume ii., pages xv. ff) he sketches the course of this process in the religions of Europe. The Reformation he describes as a retrogression from the rationalism of fifteenth century Italy, brought about by the ascendancy of German barons and peasants, newly born to intellectual life. Now the crude Protestant world has in turn been largely rationalized, and M. Reinach predicts for the twentieth century the further extension of enlightenment to the lower classes of the population who have never attained it hitherto. This formula is doubtless inadequate, both for the analysis of modern religion and for the conjectural reconstruction of primitive life, but M. Reinach's statement of it is earnest and vigorous, and his application of it to special problems is fertile in suggestions.

It is, of course, impossible here to give suitable consideration to the individual essays in the collection. Within the general field of the science of religion they deal with a large variety of topics, ranging from the origin of modesty to the recent controversy about "Babel und Bibel," or the writings of the Abbé Loisy. One chapter discusses a passage in Lucan and another seeks to defend the very doubtful religious interpretation of Virgil's fourth Eclogue. Others are concerned with the analysis of ancient myths or of mediæval legends. The most connected treatment is given to totemism and the taboo, which are studied in the first volume with reference to the domestication of animals, to marriage, and to the origin of sacrifice. A number of important chapters in the same volume deal with the religion of the ancient Celts, and on this subject, as on many others, M. Reinach's opinions are destructive of accepted doctrine. We cannot agree with him in his total denial of the existence of any Celtic pantheon, but we fully recognize that much of the Celtic mythology that has been constructed will not stand his searching scrutiny.

A Memoir of Jacques Cartier. By J. P. Baxter. New York: Dodd, Mead & Co.

We have brought together here a considerable variety of contents. The Memoir itself is an essay of about fifteen thousand words, and occupies less than one-seventh of the space. In point of bulk the body of the book is taken up with a translation of Cartier's three 'Voyages,' a bibliography of works relating to the mariner, and an itinerary which follows his advance from day to day. Several collateral documents, such as Roberval's 'Voyage' and the 'Course of Jean Alphonse,' are also given, besides sundry papers from the archives of St. Malo. To conclude the list, we may mention the publication in facsimile of an important manuscript which was found as far back as 1867 in the Bibliothèque Impériale. This is the account, probably prepared by Cartier himself, of the voyage made in 1534. It dif-

fers in several respects from the version given in Ramusio, and may be taken to represent the earliest narrative of this enterprise which we possess. Mr. Baxter not only gives an independent translation of the 'Voyages,' but supplies extensive notes. We have not been able to make out from the Memoir that Mr. Baxter has added much to former knowledge regarding the antecedents of Cartier or the circumstances under which he set forth to the Gulf of St. Lawrence. Such material, for example, as Mr. H. P. Biggar has been collecting for the past few years (material which will soon be rendered accessible to the public), is excluded from the present work. Mr. Baxter, however, has collected all the essential data now available, and has given value to his geographical notes by going over in person the region which Cartier explored. One rather interesting fact which Mr. Baxter's researches have elicited, is that Cartier's 'Voyages' have been translated only into Italian and English. "I was not aware of this," he says, "until I began to prepare a bibliography of the literature relating to them, but I found, upon application to the principal libraries of Russia, Sweden, Germany, Holland, and Spain, that they possessed only French versions." Despite his perfidy in kidnapping Donnacona and other Indians, Mr. Baxter rightly gives Cartier credit for ranking among the creditable rather than the disreputable discoverers of the sixteenth century. This volume, which seems to have been a true labor of love, is a worthy tribute to his memory. Printed at the De Vinne Press, the typography deserves a special word of praise.

The Life and Letters of Alfred Ainger. By Edith Sichel. New York: E. P. Dutton & Co. \$3.50 net.

The "Life" of a man like Canon Ainger is easily written and he ran no risk of an unsympathetic or indiscreet biographer. He lived the dignified, well-ordered existence of the English ecclesiastic of secondary rank. His canonry and the readership and mastership at the Temple came to him without effort and were the rewards of a charming voice, a lively wit, and an exquisitely correct taste in literature. Sydney Smith, in his day, was not more invited out, but Ainger's jests were never mordant and few are likely to survive. They were apt to be intricate and they depended on the associations of the moment. Many of them, like that on Hæwais's baby, "Pa will mind your music, but who will mind your morals?" or the epigram on Mr. Le Gallienne, which ends:

O give us more of the godly heart
And less of the Bodley Head,

will soon need a commentary and owe their merit to their spontaneity. Ainger was in fact a humorist rather than a wit. Sydney Smith himself said he was convinced that the tendency of wit is "to corrupt the understanding and harden the heart," and Ainger was fond of repeating Pascal's "Disseur de bons mots, mauvais caractère." He was a rare instance of the heart getting the better of a sharp tongue.

His personality was so entirely out of the common, like Lamb's or Stevenson's, that no one who had once seen him could ever forget his frail figure, frequent gestures, and worn ascetic face. His career was de-

termined by the fascination of his voice, which so charmed the Benchers of the Temple when he presented himself, young and unknown, as a candidate for the readership, that they elected him unanimously to that coveted post. He lived and died among the associations of the Temple, and filled the Temple church with the most distinguished congregation in London. His lecturing grew out of his sermons, and his favorite subject was Shakspeare, which gave him a chance to display his great talent for acting. He had the whimsical, fantastic temperament of his favorite, Charles Lamb, and Elia will never have a more sympathetic editor. He was, of course, an exceptionally well read man, and when he speaks, on page 261, of Menander as quoted by S. Paul (he should have said, of course, Aratus) the slip of the tongue is obvious.

Miss Sichel's biography derives its chief interest from the letters, especially those to and from Du Maurier, who was Ainger's closest friend. Ainger's delight in *Punch*, over which he used to "write with amusement" every week, is less mysterious when one remembers that he furnished many of the jokes that were illustrated by Du Maurier. Less easy to explain is his passion for punning. The habit was ingrained, and though he often kept back an unkind witticism he was never known to resist a bad pun. In the first of the excellent full-page portraits in Miss Sichel's volume one may see clear evidence of that French Huguenot descent on which Ainger prided himself. The book is well got up and light for its size.

Animal Snapshots and How Made. By Silas A. Lottridge. Illustrated with photographs from nature by the author. New York: Henry Holt & Co. Pp. xv, 338. Price, \$1.75.

Mr. Lottridge has spent many of his annual vacations in the field, photographing and studying wild life. In the present volume he has woven his observations upon some of the familiar animals and birds of eastern North America into a series of short life histories, which he has illustrated with the products of his camera.

The book is divided into two parts, the first of which deals with mammals and discloses an intimate knowledge of the affairs of such forms as the fox, woodchuck, skunk, raccoon, opossum, muskrat, white-footed mouse, and squirrel. The pictures are uniformly good, while some of the series, for instance of the woodchuck and the muskrat, are splendid. To one familiar with the difficulties of outdoor mammal photography, they speak of great patience and prolonged effort.

The second part of the book is devoted to birds, and opens with a chapter on migration, in which our present knowledge of this complex subject is reviewed at some length. Of the birds as of the mammals the author has selected the well-known forms rather than the rare. They have not been chosen from any one group, but cover the greater part of the land birds in their range; and although the reader may be familiar with the bluebird, the robin, swift, bobolink, woodcock, crow, great-horned and screech owls, and the hen and sparrow hawks, to each of which a chapter is devoted, he will, nevertheless, find many in-

teresting notes about their daily life and domestic affairs. These sketches, too, are illustrated by good photographs, those of the great horned owl and the red-tailed hawk being especially fine. There is also a chapter on the photographer's outfit, which has many helpful suggestions, especially for the beginner. With the apparatus here described and an endless store of patience he may add many ornamental and valuable trophies to his collection of photographs.

The New Sketch-Book. By W. M. Thackeray. Edited with an Introduction by R. S. Garnett. London: Alston Rivers, Limited.

The volume consists of a number of reviews originally published in the *Foreign Quarterly* from April, 1842, to July, 1844, now collected and attributed by the editor to Thackeray. None of the subjects is of first-rate importance; Hugo's "Le Rhin," Dumas's "Crimes Célèbres," Balzac's "La Presse Parisienne," and Sue's "Les Mystères de Paris," are perhaps the most notable. Nor do they include any very remarkable criticism. Their interest consists almost exclusively in the ascription to Thackeray. The evidence upon which the editor relies to substantiate his assertion is mainly internal, with the exception of that which may be called coincidental. For instance: "In 1842 Thackeray wrote to Edward Fitzgerald that he had read, . . . by way of amusement, Victor Hugo's new book on the Rhine. 'He is very great, and writes like a God Almighty,' continues Thackeray." "And on the first page of the review . . . we find him parodying Victor Hugo, who is very great; and on the third page he shows him posed as a divinity." The argument from style is equally conclusive or not as you look at it, particularly as it is not the mature and inimitable manner of the novelist which it would be likely to resemble under the circumstances, but rather the more or less conventionalized medium of the journalist or the hack. As it happens, then, no one but an expert, a thorough student of Thackeray's style on all subjects and at all periods, would be able to pronounce with assurance upon the authenticity of the papers. And yet there are passages here and there which would probably strike the ordinarily attentive reader as Thackerayan in tone and sentiment, even if he had never been warned of them. Such little terms and phrases as a "how d'ye do vein of eloquence"; such an apostrophe as "Ah, Monsieur Hugo—be careful of your jocularly, you are at best but a poor hand at wit; your pleasantries are for the most part old, very old, and weak, and stale. If joke you will, gibe at the rich as a philosopher may, but do not sneer at the poor"; or such a very characteristic tirade on snobbery as occurs in the "German in England:" "What a strange, simple adulation it is that we pay to that picture of an English coronet; we who look down with such grand contempt upon all foreign titles, talking of swindling French counts, beggarly German barons, shabby Italian princes, with lofty indifference and scorn!" These are certainly very like—as is also the general resemblance to Thackeray's partialities and prejudices. On the whole, the editor appears to have made out a

fair case; and the curious may be referred to his own presentation of it in the third section of his Introduction. For the matter is, after all, of small consequence, except to the curious; the essays, even if they are Thackeray's, will add nothing of value to his literary monument, and will merely serve, in future editions, as so much additional lumber to a work which is bulky enough already.

James, the Lord's Brother. By William Patrick, D.D. New York: Imported by Charles Scribner's Sons. \$2.00 net.

In a book of some 350 pages purporting to be a biography of a man about whom little information is to be had, there are naturally lengthy observations on minute questions, as well as inferences for which there is slight justification. There is really no means of knowing whether James studied Biblical Hebrew, or whether he could speak Greek, or whether he was instrumental in the conversion of his mother. The latter Principal Patrick pronounces "highly probable," and similar conjectures which have not the slightest foundation in fact abound in his pages. One of the first lessons in historical criticism is to learn that there are a host of questions which one has no business to ask, since the requisite data for their answering are not at hand. The author of this essay has not learned this lesson, and he can write a chapter of thirty pages on "James, from the Beginning of our Lord's Ministry to the Resurrection." There is, on the other hand, no adequate discussion of the authenticity of the Epistle. It is simply remarked that "the genuineness has been called in question, but improperly," and that the evidence in its favor "is more than adequate to convince any reasonable man." This is hardly respectful to those who hold the opposite view. Such an article as that of the late Orello Cone in the "Encyclopædia Biblica" demands more consideration. One wishes that Principal Patrick had endeavored to make clear how a loose collection of moral precepts such as the letter of James, the Book of Proverbs of the New Testament, which contains about as much information concerning Jesus as it does concerning Elijah the Tishbite, could have come from an own brother of the founder of Christianity, who was sufficiently in sympathy with the prophet of Nazareth to have become a leader in the Church in the days of its first enthusiasm and fire, when

Jesus the Messiah was its gospel in season and out of season, and when with expectant, exultant hearts, the Christians watched the heavens daily for the coming of their Lord. "James" is too calm, too quietly good, for the date to which Principal Patrick endeavors to ascribe it. In an essay which undertakes to present all that can be known concerning James, the Apostolic Council at Jerusalem described in Acts xv. naturally receives full treatment. The author has a brief for the traditional opinion. He insists on the reliability of the narrative in Acts and interprets Paul's words in harmony with it. This is not a new solution; it has been definitely abandoned by the majority of critics and Principal Patrick advances no good reasons for returning to it.

Confederate Operations in Canada and New York. By John W. Headley. New York: Neale Publishing Co. \$2.

John W. Headley is a cool hand, whence his extraordinary, if not altogether edifying, experiences at the time of the civil war. A Kentucky man, he joined the Confederate forces, and became mixed up in much of the guerrilla fighting and spying that fringed the contending armies with a wide zone of adventures. Some clever escapes from capture, and an in-born capacity for going nearly anywhere and doing anything marked him out for special service when, in 1864, Jeff Davis grew desperate and began to hit wildly. Then a few score Confederates, most of them escaped prisoners, began operations on the opposite frontier from Robert Lee, and in an opposite manner. The United States were invaded from the north. Forty Confederates held up the town, and, especially the banks, of St. Albans, Vt. Mr. Headley, with another band, effected a lodgment in New York city, via the New York Central, and, with a skill open to criticism but a coolness that compels amazement, prepared to burn down the city. This delightful feat, the details of which he now complacently offers to an insatiable public, was to celebrate (or perhaps accelerate is the word) McClellan's election to the Presidency; and, until a suitable date for the event could be fixed in agreement with a local Copperhead committee, our author, apparently bent on self-improvement, attended the then popular entertainments—Barnum & Bailey, Henry Ward Beecher, Tammany Hall, and Arte-

mus Ward. On the night of the 25th of November, 1864, the great and noble enterprise was carried out. Nineteen hotels and Barnum's Theatre were fired—for in what twenty localities could more innocent victims be found conveniently herded together? But, alas for Mr. Headley and his friends, a very few minutes sufficed to put the fires out, and he had to retreat, defeated, by sleeping car, to Canada. The police were all apparently in Virginia with Grant, or asleep.

Mr. Headley's book is mostly an inaccurate rehash of the facts of the civil war; but a few chapters contain an account of the New York affair that might, if better presented, have been interesting. As it is, the style is graceless as the narrative is shameless.

BOOKS OF THE WEEK.

Mr. MORLEY ROBERTS'S
Masterful Novel of Society.

The Nation.

NEW YORK, THURSDAY, AUGUST 23, 1906.

The Week.

Mr. Root talked at Buenos Ayres very like an anti-Imperialist and an old-time believer in republics, democracies, and self-government. He spoke with warmth and grace, and his praise of the Argentine Republic was thoroughly to the point. That country is justifying our American faith in the ability of peoples to govern themselves, precisely as the Filipinos will after they have had a fair chance; and citizens of the United States who follow South American affairs have taken great comfort in Argentina's remarkable prosperity. As an ambassador of good-will and friendship, no one could have done better than Mr. Root in all his speeches thus far. But, unfortunately for the practical side of his mission, his lips are sealed on one subject. He cannot hold out to South Americans a prospect of closer trade relations. He cannot say to them: "By means of reciprocity treaties and otherwise, we shall now seek to have close and mutually profitable business ties with you." He cannot forget, if he would, that McKinley and Hay, after negotiating a reciprocity treaty with the Argentine Government, were forced to see it rejected by the Senate, and that the bold Roosevelt has not had the stomach for a contest with the stand-patters, on this or any other subject.

And he has topped off his successful trip to Argentina with a more explicit adherence to the Drago Doctrine than this country had yet made. In all his addresses he has struck the tone suitable for his Latin-American audiences, contriving to be both florid, sincere, and dignified. If one were to seek the unique merit of his various addresses, it would be found in their freedom from condescension. He has nowhere talked down to the South Americans, or admonished them as to their racial shortcomings, but throughout has treated them as equals of the United States. This was, to be sure, an obvious counsel of good breeding; but in view of previous dealings with South America, Mr. Root's course evinces positive originality. To assure these sister republics that, with all their faults, we love them still—to advertise them in our state papers as *enfants terribles*—is not precisely the way to win their abiding affection. Mr. Root is to be heartily congratulated upon rejecting the old formulas and following his instincts as a gentleman.

A victory, said Wellington, speaking

of the miseries of war, is only less terrible than a defeat; but last week's "Odell Victory" in the Republican State Committee is of a sort more disastrous to the party than any defeat. It shows that the Republican organization in New York—the President's State—is not only torn into factions, but is made a prey of by disreputable bosses using unscrupulous means. The long plotting by which the discredited and hated Odell, combining with the discredited and despised Platt, succeeded in retaining control of the State Committee, may be fun for the bosses, but it is death to the party. Such proceedings will dispose thousands of Republicans to forswear allegiance to a political organization that is now simply competed for by wreckers. And even if Gov. Higgins's friends had succeeded in defeating Odell by a vote or two, the result could have been little inspiring. A party that could be saved by a parcel of State officeholders, headed by Aldridge and Hendricks, would already be beyond saving. As for the Governor's own attitude, it seems to become more pitiful every day. Too timid to fight and too uncertain of himself even to run away, his course has both amused his enemies and disgusted those who try to be his friends. His telegram commenting on his own rebuff by Odell—that it has his "hearty approval" if it "proves to be in the interest of the Republican party"—certainly touches low-water mark for bathos and ineptitude. But the party all around is at low-water mark.

The resulting Democratic opportunity is magnificent. Never was there a finer chance to break the Republican hold on New York. A feeling akin to nausea pervades the people of the State as they contemplate the performances of the Republican bosses, big and little. Indeed, so strong is the contempt and anger aroused by the goings on of the party machine, so deep is the resentment at the complacent weakness of Higgins, that a "desire to punish" is reported as becoming more intense each day in all parts of the State. If the Democrats were to present a strong and clean candidate, on a sound platform, their triumph at the polls would be conceded by every impartial political observer. This is the situation which makes the call for Jerome so significant. There is a general sense that he could fire the party and inspire a campaign as could no other man in the public gaze. There is, to be sure, the Hearst menace, or diversion, or whatever it may be called. It plainly constitutes the only hope of the Republicans. But for Hearst, they would go into the struggle confess-

ing defeat in advance. But if the follies and vices of the Hearst movement have to be exposed and fought, who so well fitted for that work as Jerome? With him as Democratic nominee, we should have a leader whose fearless tongue would give us such just but blistering characterizations of Hearst and his motives as would make for the public well-being.

The Texas Democrats nominated their State candidates last week in their first trial of the new primary-convention law. Even before the convention was held, the press of the State was practically a unit in favor of the amendment, and especially the simplification, of this remarkable statute. The feature of it which most invites comment is its unique provision for preventing mere plurality nominations. The adoption of the direct primary in Wisconsin, Oregon, and Mississippi has meant the entire abandonment of the nominating convention. In Texas, however, the framers of the law devised an ingenious combination of the two methods of selecting candidates. The people vote on primary day for the candidates themselves, of whom there were four this year in Texas. Each county, meanwhile, has been allotted a certain number of votes in the convention. Suppose that in a county entitled to five convention votes there are 1,000 ballots actually cast in the primary; then 200 votes for a particular candidate will have the effect of peremptory instructions upon one delegate, 400 votes upon two delegates, and so on. The first ballot in convention is, in effect, merely a return of the vote in the primary. In this instance, it stood: Campbell 212½, Colquitt 169½, Bell 164½, and Brooks 155½. No one having a majority, the lowest candidate, Brooks, was eliminated. His delegates, except as some of them may have been instructed in the primary for the second or third ballots, were free to use their own judgment, and enough of them went to Campbell to nominate him. If they had not, Bell, the next lowest candidate, would have been dropped, and the same process repeated.

The immediate objection to this plan is that it is too complicated; but the real question is whether it is possible to combine the features of the convention and the primary system. Every one would probably agree that it is well for a convention to meet with so many of the delegates instructed that the ballot merely records the will of the rank and file of the party. But it is a virtue of the convention that, when there is no such agreement in advance, it, or its

leading spirits, can deliberate—or dicker—until some acceptable man is agreed upon. There was a time when an election itself, if carried by a mere plurality, was not regarded as valid. That feeling still persists in regard to plurality nominations. In Louisiana or Mississippi, when the primary election develops a majority for nobody, a second primary is held between the leaders, just as, two generations ago, in many of the States, a second election would be held in case no candidate received more than half of the votes at the first. That is as troublesome and expensive as possible, but it is simple and easily understood. In practice, the tendency is to eliminate all but two candidates before primary day. The Wisconsin law now permits nomination by a plurality, but all the candidates for Governor, we believe, are in favor of changing this provision. La Follette wanted an expression of second choice on every primary ballot, substantially the plan suggested here some years ago by Daniel S. Remsen, but the Legislature would have none of it.

The Statehood fight, as regards Arizona and New Mexico, having been transferred to those Territories themselves, there appear to be surprisingly few indications of any active campaign. Indeed, if we take the news dispatches as the sole authority, the large majority of both parties in Arizona must be opposed to joint Statehood which, of course, would dispose definitely of the present chance for the admission of a forty-seventh State. Only 24 per cent. of the Democratic and 29 per cent. of the Republican Territorial Committeemen are said to be in favor of accepting the provisions of the law of 1906, as President Roosevelt so strongly advised. Whether this dogged persistency for separate Statehood is inspired by mining and railroad interests, as the champions of union always contended, or is an absolutely sincere manifestation of local patriotism, it has certainly been a wonderful demonstration. If Arizona wishes to remain a Territory on the chance of finding some day a Congress ready to vote two new States, she has a perfect right to do so. But it has wisely been settled, we think, that the interests of the whole country are paramount over mere sympathy for a people who evidently want what they want very badly. If Arizona should develop to such an extent as fairly to justify Statehood alone, the new State would be welcomed with added cordiality for having so long displayed the courage of its convictions.

Neglect of small industries in the South is at last beginning to arouse the attention of farmers and the press. The Raleigh, N. C., *Progressive Farmer* recently printed a letter from an expert

who protests against the habit of ignoring everything save cotton. It is "King Cotton" over again, in a fresh sense. True, new industries like mining, timbering, cotton manufacture, and the making of turpentine and rosin are steadily being expanded, but these involve large amounts of capital. The incidental opportunities of the man with an acre or two, who raises a few bales of cotton, are sadly neglected. Bee-culture, raising of silk worms, hay growing, and the production of seeds for Northern markets, the keeping of goats, the culture of pecan nuts—these are some of the valuable small industries to which the *Progressive Farmer's* expert calls attention. Moreover, near Raleigh he finds valuable water power going to waste, to say nothing of the folly of taking no advantage of the hard woods, white oak, hickory, and dogwood, with which the neighborhood is enriched without being aware of it. There are fields in sight of Raleigh, and we might add, of about every other Southern city, which have not been in cultivation for the last twenty-five years, and yet would make excellent truck farms. One difficulty is, of course, the laziness and indifference of the poor whites, with the uncertain labor of the blacks. Time and education are the remedies.

Formal acceptance of the new Pennsylvania State Capitol has drawn attention to the fact that it is one of the few important public buildings in the country which have been completed on time within the estimates. With the Library of Congress, conditions were unique; the work being under the almost absolute control of Gen. T. H. Casey of the War Department and Bernard R. Green, who were vested by special act of Congress with unusual powers. The new Pennsylvania Statehouse was provided for by the Legislature of 1901. The appropriation was \$4,000,000. Of this amount, Mr. Joseph M. Huston, the architect, will turn back some \$40,000 into the State Treasury. Ground was broken November 7, 1901, and on October 4, 1906, the building will be dedicated. That this unusual record was made with no sacrifice of æsthetics, is indicated by the fact that \$430,000 was expended for statuary and mural decoration—to say nothing of the famous animated busts of Pennsylvania "types" on the bronze doors.

It is a fine thing to be a Government employee; it is a fine thing to be a union man. When one is both at once, felicity can no further go. Therefore, the whole country shared in the sense of outrage when a cold and brutal foreman ordered a union binder in the Government bindery to do some extra work. Apparently, there was some obsolete United States statute which authorized

him to give the order; but there was also a union-made restriction on the maximum amount of work which any one man should do. Much the same situation existed, therefore, as if the resolution of some remote board of village trustees should come in conflict with the Constitution, or our treaty with Great Britain. What makes the matter worse is the fact that Acting Foreman Ashton, who issued the latest extra-work order, was the man who caused the removal, only three years ago, of the assistant foreman of printing over the open-shop issue. If he is allowed to continue much longer in his mad course, we shall presently find the heresy spreading that the Government Printing Office exists to turn out work, and not to create easy and remunerative jobs.

The Pope's encyclical is a flat declination to accept the terms of the French Separation Act. The actual issue concerns parish administration. The law requires that a "cult association," virtually a board of trustees, shall be established in each parish. This board is made responsible for the maintenance of worship and in general for all the actions of the church. Of these committees, which, of course, have no standing in canon law, the Pope says, "they cannot be formed without a violation of the sacred rights which are the life itself of the Church." Very serious consequences must follow this decision. In every parish in France the faithful will be subject to ejection from the churches. The Pope's encyclical leaves every commune free to apply the resources of recalcitrant churches to the poor fund, hospitals, and the like. A wholesale exercise of this right would in certain regions, especially Brittany, come near to provoking a revolution. But the law has wisely retarded the march of confiscation by requiring in every case a decree of court. The hope of Pius X. must be that the enforcement of the act will make so much trouble that the Government will be led to adopt amendments acceptable to the Church. The encyclical, indeed, contains a hint that the passive resistance enjoined upon French Catholics is tactical in character. Still, we hardly expect to see M. Sarrien or any successor in the near future go to Canossa.

The German Emperor's severe criticisms of the press of his country, as detailed by the great chocolate manufacturer, M. Menier, in a Parisian interview, have naturally given deep offence to the profession. Columns upon columns of criticism of his criticism have filled the German newspapers. The Emperor is reported to have declared that journalists of twenty-two, writing with an anonymous pen, are capable of disturbing the world. Editors are lacking

in a sense of responsibility; they have pursued no prescribed course of study, and passed no State examination such as is required in other regular professions. The Berlin *Nation* slyly quotes the Paris *Matin's* remark that, if it is true that editors pass no examinations, neither do kings and emperors. The King of Spain, for instance, was much younger than twenty-two when the destinies of the Spanish people were placed in his hands; and the Great Elector of Brandenburg was but twenty-one, when, unexamined, he laid the foundations for Prussia's greatness. It might be asked, too, whether rulers like the Czar have developed sufficient sense of responsibility. The Berlin *Tageblatt* fears that the Emperor has made the error of thinking that the opposition to his policies of a large portion of the press is only to be defined as irresponsible conduct. The *Frankfurter Zeitung* thinks that William's attitude towards the press is merely that of many another: "He complains of it when he is angry with it, praises it when it pleases him, and knows how to use it when he needs it."

The hatred of the people of Warsaw for the Governor-General and his chief of police is largely explained by their having the right to punish, without trial, any person whom they think politically untrustworthy. This is the statement made in a letter from Count Tyszkiewicz, leader of the Polish Nationalists, to Prince Mirsky. It was written in 1905, with the understanding that it would be laid before the Czar, and it is therefore an accurate summary of the wrongs of Poland and the desires of her people. A translation of this document has just appeared in the London *Tribune*, and the list of grievances it contains is long. Primarily, Poland protests against the process of Russification to which she is subjected, then against the persecution of the Catholics. No less than 87,994 families, it is declared, suffered severely in 1899 "because they endeavor to maintain the sacred religion of their forefathers and keep their consciences clean." The Polish Catholic clergy has to submit to the same passport laws applicable to persons under police supervision; many of their churches have been closed, while new ones may not be erected. Even the children do not escape:

The obligatory application of the Russian language to almost every circle of public life shows its destructive effects, especially upon young children who are obliged to express their thoughts in a foreign tongue, thus delaying and restricting their mental development. The schools in such circumstances tend to wipe out national individuality, to warp the thoughts and the hearts of the young, and to force them to grow up in an atmosphere of passive revolt, falsehood, and hypocrisy.

If only the "exceptional laws" for Poland could be repealed, Count Tyszkiewicz declared, his people would "move forward in steady and peaceful progress." His appeal received no attention, and the lot of Poland has grown so steadily worse that now, after a year and a half, there is open anarchy in Warsaw. The Nationalist party has been compelled in the interim to become one of action, and terrorism is epidemic. Despite their name, the Nationalists are not at the moment agitating for separation from Russia. They are apparently perfectly willing to remain under the control of the Czar, if he will but give them rights as a State within the Empire and as individuals within the State. Here are their main desires, in briefest form:

- (1.) The free use of the Polish language in the schools, the law courts, and in all Government and public institutions.
- (2.) The employment of Poles in Government and public posts.
- (3.) Local self-government in both towns and rural districts.
- (4.) The restitution of the rights of the Roman Catholic Church, and full liberty to the subject to profess what form of religion he chooses.

A wise and farsighted ruler would think the pacification of Poland cheap at the price. Instead, there comes the slaughter of policemen on every corner in Poland's capital, the order of Gen. Kaulbars to military officers not to go on the street, lest they be murdered, with perhaps greater terrors to follow.

There is something pathetic in the spirit in which emissaries of the Russian revolution have come among us, and the different spirit in which they have departed. Before sailing for Europe, Gregory Maxime summed up his impressions of this country as follows: "In America, where the people enjoy so much liberty, the standard of civilization and culture is on a much lower plane than in Russia. Americans know nothing of idealism. The question the American always asks is, 'How much?'" Other Russian radicals have left on record similar opinions, the justice of which is not of so much importance as the fact that they should be such bitterly unfavorable opinions. They cannot be due simply to disappointment. If Gorky's mission had proved completely successful, his views of us would not have been very different from what they are. The great majority of this country, on the other hand, would have regarded him with mixed feelings—with admiration as an artist and champion of liberty, and with puzzled distrust as a theoretical anarchist.

So the anomaly remains. Here is a country endowed with land and liberty, with a democratic form of government,

with freedom of speech and the press, with exemption from oppressive military burdens. In Russia, the revolutionaries are staking their lives to conquer the same blessings for the people; and yet—they don't like us. The reason may possibly be found in the predominantly "intellectual" nature of the Russian revolutionary movement. In the new Russia which is to be, the people will enjoy not only the material advantages which we have, but also the fine flavor of culture, the idealism, which are now the possession of a comparatively small number. That culture is perfectly compatible with absolute equality, the leaders of the revolution take for granted. That in a democratic Russia, idealism, after our own example, would disappear, they will not admit. Every one will vote, but principles will not give way to interests. The peasant and the proletarian are to shoulder their way into street cars, cafés and halls of assembly, but manners are to remain urbane. The *mujiks* will read the newspapers, but there will be no yellow press. They will invade the theatre, but Ibsen will reign there, and not musical comedy. An intelligent Russian revolutionary once privately laid down the thesis that in culture the Russian peasant is immeasurably the superior of the American farmer. Putting aside the mere question of competency for judgment in a stranger who had studied the American farmer in his natural habitat southeast of Union Square, some one asked for a statement of just what ideals the peasant acknowledged that were superior to our deified dollar. The answer was: "Why, they may be crude and indefensible ideals, but they are nevertheless there; unselfish and spontaneous and therefore exalted, as, for instance—the Czar or the Holy Orthodox Church!"

That all is not going well in Korea, under Japanese protection, is grudgingly admitted by the Tokio correspondent of the London *Times*. The facts, as he states them, are not essentially different from the account of the Tokio correspondent of the Munich *Allgemeine Zeitung*, who asserts that Korea is practically falling into open revolt. Insurrection is rampant. There are numerous skirmishes and sieges of towns. The centre of the uprising is in the province of Chyung-Chyöng, on the western coast, an inaccessible mountainous region. The town of Hong-tju was occupied by the insurgents, on account of the large stores of ammunition and arms in the place. Several times the troops sent to reduce it were repulsed. At last the Japanese concentrated a force sufficient to carry the town with great slaughter. Similar uprisings are reported in many of the Korean provinces, the whole country approximating a state of guerrilla warfare.

FLAT-FOOTED MR. CANNON.

"Fortune does not favor men of our years," said Louis XIV. to Marshal Villeroi, after the battle of Ramillies. Dependent Louis was then not quite seventy, and did not foresee that an American would arise to prove his maxim false. Youth will be served, indeed! Speaker Cannon, a likely young fellow turned seventy, has steadily risen in popularity as he has risen in age. The formal launching of his Presidential candidacy in Illinois last week is but the culmination of that good fortune which, in defiance of French proverbs and the sour sayings of the Ecclesiast, has steadily increased with his years. We do not mean that he is to be taken too seriously as a candidate; but the universal feeling of amused kindness for a gallant veteran, with a sort of diffused personal interest in the quaint and frank character of the man, is a more striking tribute than the bestowal of many offices.

In his recent speech at Danville, some of Uncle Joe's most engaging qualities were revealed again. His downright and square-cut ways are in refreshing contrast with the tricking facilities of the ordinary politician. On the tariff, Mr. Cannon is positively delightful. Here, at any rate, is one sincere believer in it as the source of every blessing. Others may hedge and blush and hem and haw, but your Uncle Joe roundly tells you that "since the enactment of the first revenue law under Washington down to the present time, the periods of prosperity have been under protection, and the periods of adversity have been under the policy of free trade or tariff for revenue only." This, of course, he devoutly believes. Some protectionist orators, or historians like Biaine, will admit that the country was fairly thriving and progressive under the low tariff of 1846-57. Of course, they try to explain the fact away. They will say, with Horace Greeley, that it was only "a factitious but seductive semblance of prosperity." But no such doubts or shifts for Uncle Joe. He lays down his "platform facts," that a high tariff is always and in all ways beneficent, and a revenue tariff ever and in all places a curse, without a quaver or qualification. He believes this just as an old farmer believes that if he hangs a horseshoe on his apple tree at Christmas, he insures a good crop in October. "It may sound queer, but I've tried it too often not to know that it is so." All the tariff part of Mr. Cannon's happy speech was marked by this charming simplicity. One has not the heart to challenge any of his statements made in such unwinking good faith. This was the perfunctory and expected feature of his address. He always preaches tariff that way. We suppose that the innocent Vermilion County farmers who

heard him imitated their Yorkshire brother by saying:

I niver knaw'd whot a mean'd, but
I thowt a 'ad summut to saay,
An' I thowt a said whot a owt to 'a
said, and I coom'd awaay.

What will truly interest the country in Mr. Cannon's position is the direct and manly way in which he met the pretensions of the Federation of Labor. To its demands, he applied the old-fashioned method of giving a plain answer to a plain question. Alluding to the class legislation asked for arrogantly in the name of labor, and known as the anti-injunction bill, the Speaker first properly characterized it, and then said flatly, "I am not in favor of this legislation demanded by Mr. Gompers," and then clinched the nail by adding, "I will be at all times opposed to this legislation." Surely a fine old gentleman, who says it is too late for him to learn to quibble or stoop or truckle! It might be well if some other public men would make haste and grow old along with this Rabbi Ben Ezra of ours, provided that the process would stiffen their vertebrae a little. There has been a vast amount of ducking and wabbling in connection with this anti-injunction bill. President Roosevelt himself, commendable as was his plain speaking to the labor delegates last winter, has not taken a clear position in regard to this demand of organized labor. He could not bring himself to favor it, yet he would not condemn it, and looked about for his customary compromise. Congressman Littlefield, whose minority report from the Judiciary Committee of the Fifty-seventh Congress did much to put the matter in its true light, has not been dismayed by labor threats, any more than Speaker Cannon, though he, too, has been marked for political destruction by Mr. Gompers. Doubtless he is willing to say with Uncle Joe that he is ready to take his chances at the ballot-box with the real laboring men of the country, as against those whose votes Mr. Gompers professes to be able to control.

This is the aspect of Mr. Cannon's campaign the present year which promises to be most significant. He is to speak for Mr. Littlefield, principally, of course, to show that he despises the threats of the labor leaders. The sound doctrine of equal rights for all he will doubtless write on his banner in the other places where he is to be seen. His course, in this respect, and its political results, it will be most important to study. If he stands pat on the tariff, he also stands pat on equity and the principles of law and justice older than the Constitution and underlying it. For that kind of stand-patter the country has urgent need, and may well admire and applaud one of that rare breed among politicians, when it is lucky enough to find him.

MAKING FRIENDS WITH "ABROAD."

The Paris *Temps* has seriously offered a novel explanation of Mr. Bryan's Odyssey. We are told that this twice-beaten candidate has found an ingenious way to rehabilitate himself by a subtle appeal to American vanity. We all of us have an extreme sensitiveness to the opinion of the Old World; we exult immeasurably in the notoriety of Mr. Roosevelt; we regard as paid to our nation and to ourselves individually the honors and courtesies so lavishly showered upon the editor of the *Commoner*. Mr. Bryan has been astute enough to personify the adulation of Europe for the giant Republic. So in substance the *Temps*. Without going the whole way with our Parisian contemporary—for there are Americans who regard the European vogue of Mr. Roosevelt with amaze; and there are some millions of us to whom the opinion of Europe is remote as the canals of Mars—Mr. Bryan's foreign feats mark a fairly revolutionary change of sentiment. The tribune of the tolling masses, the stern accuser of plutocracy, consorts with the great of the earth, breaks the bread of royalty—and all this unrebuked, without in the slightest degree diminishing his acceptability as a popular candidate.

Now, whether or not this evinces an enormous growth in snobbishness among Americans, it certainly testifies to an entirely new attitude. Only look back a few years and imagine Samuel J. Tilden putting his legs under royal mahogany to improve his chances; those legs would assuredly never have served him again for political purposes. Every one remembers that Lowell, Phelps, Bayard, and even John Hay were roundly berated for no other reason than that they did not make themselves offensive to the court to which they were accredited. For a matter of twenty years, no Presidential election passed without the dread that from the overflowing coffers of the Cobden Club, "British gold" in enormous quantities would be poured in to swamp our prosperity and republic together. The watchword of the period was, "What have we to do with abroad?"

Well, we have learned that we have various things to do with it. Expanding trade has taught us something; the auspicious appearance of our Government in the diplomacy of the world has perhaps taught us more. The growing habit of European travel has shown that "abroad" regards us with no malevolence, at least, but with curiosity not unmixed with dismay and admiration. Beyond this, scholarship and art have gradually established very substantial bonds between the intellectual élite of both worlds. It would be foolish to exaggerate the extent of such cordial understandings—in fact, any genuine comity between nations is rather based on

perceiving and accepting real differences than on ignoring them; but it is clear that the old suspiciousness and hostility towards Europe have largely abated. It still pleases a certain type of Jingo to knit his brows over the devilish plots of the Kaiser, but, generally speaking, there is no political or personal capital to be made to-day by abusing any potentate of Europe—not excepting the obviously vulnerable Czar.

The suddenness of the change is so surprising as to suggest that the traditional detestation of "abroad" was less ominous than it seemed. As a matter of fact, the improvement in our national manners is in a very evident relation to the disappearance of the "Irish vote" from politics. It was possibly not an actual hatred of perfidious Albion, but a sense of an Irish-American balance of power that set our aspiring politicians to twisting the tail of the British lion whenever the unhappy beast was in evidence. Everybody took a hand, but naturally it was the Irish Republicans who excelled at this pastime. Patrick Egan cuttidd O'Donovan Rossa in caudal feats; Elaine commanded a fine diplomatic torsion by way of the fisheries disputes. And all this pretty comedy was played for the better entertainment of the Terry's and Mikes who were political powers in their respective districts. To-day the Irish vote, old style, has gone the way of the Barnburners and Locofocoos. Whoever would conciliate the Italian, Jewish, Greek, Polish, Finnish, Scandinavian votes, and whatever others there be, must be prepared to reckon with every monarch in Europe; and even the political intellect is staggered to find a formula that will please all lands. Crowned heads have lost practical significance, and the most robust politician wouldn't shy a billet at the most conspicuous of them. We shall have "votes" enough and to spare, but never again the fine, free way with the international cudgels.

As sensible men, we must accept what remains. There is compensation for the past in the fact that the domestic octopus has eight available members where the lion had but one. It is probable that the great mass of quiet people take just about as much or little interest in foreign matters as they did twenty years ago. In any case, such satisfaction as they may find in seeing a man of the people standing honorably before kings does them no discredit. And politics is likely to be a more possible occupation for a gentleman when foreign travel and associations require no apology. If the *Temps* wishes to be convinced that the interest in Mr. Bryan's universally good reception is not merely snobbish, let it inquire as to the effect of the equally distinguished hospitalities extended to that estimable young couple, the Longworths. That they caused emotion in

this country, is doubtless true, but it was not one of exultation.

THE UNION PACIFIC AFFAIR.

There has been enough confusion, in current discussion of the Union Pacific Railway's new dividend policy, to make advisable a thorough review of the circumstances. Ordinarily, it would strike an uninformed observer somewhat oddly to see an increase in a great railway's dividend rate received with a storm of protest and denunciation. No one asserts that the dividend was paid out of capital; enough was earned in the year's operations to provide for dividends at last week's rate, without trenching even on previously accumulated surplus. It would be quite in order for such an observer to ask why the directors' action, in marking up that rate from 6 to 10 per cent. per annum, should be subject to unsparing criticism.

The Union Pacific Railroad has been almost exactly nine years out of bankruptcy. Its financial collapse in 1893 had resulted from three causes: reaction in trade from the prosperity which had led, a dozen years before, to exaggerated hopes of the company's future; heaping-up of debt at a rate which far "over-discounted" that future, and payment to shareholders, in high dividends, of money much of which ought to have been re-invested in improvements. The financial reorganization of 1897 cut down very heavily the company's fixed charges, but increased the capital stock by \$75,000,000. It has since grown \$163,000,000 larger. The new common stock was regarded mainly as a "bonus" to reconcile old security-holders to the reorganization; it was so poorly esteemed that at the time it sold for 15 cents on the dollar.

It is true that in the hands of a very competent management the new company prospered; eventually, it got the benefit of the extraordinary "boom" in Western trade which has marked the past six years. The new managers met this situation with admirable conservatism; despite the suddenly increased earnings, they paid no dividends on even the new preferred stock until 1898, and none on the common shares until 1900, and for five years thereafter they kept the common stock dividend at the relatively moderate rate of 4 per cent. The surplus over this dividend was put back into the property—a fortunate policy in more ways than one. In nearly all annual reports of the company's president, continuance of this policy was foreshadowed, both on the Union Pacific and on the lines controlled by it.

With the marked swelling of Western prosperity, as a result of the great harvests of 1905, common stock dividends were increased last October to a 5 per cent. annual rate, and last April to 6.

This was a reasonably rapid increase; but the management's previous conservatism had been such that the advance was readily approved. It was even admitted that the exceptional harvest prospects of this season might warrant further increase—preferably, however, in the form of an extra dividend, which should arouse no exaggerated ideas regarding the future. Instead of taking such action; instead even of putting the common stock on a 7 per cent. basis—the highest rate now paid by any transcontinental railway—Union Pacific directors last week announced 5 per cent. for the half-year dividend, and proceeded to give out statements to the effect that this dividend might be regarded as permanent, thus putting the common stock on a 10 per cent. annual basis. Instead of paying out \$4,300,000 to common shareholders, as in 1904, the directors propose to pay out \$20,009,000. Part of this increase, though only a small part, is derived from dividends, simultaneously declared by virtually the same officers, on Southern Pacific stock, of which Union Pacific owns one-half; yet it is this very Southern Pacific of which Mr. Harriman, president both of that company and of Union Pacific, said, in concluding his annual report last autumn, "In view of the large expenditures required, . . . as well as to strengthen the company pending the effect of the aggressive building of competitive lines which are being projected into the territory served by these lines, it is important to hold in reserve and carefully husband the resources of the company." The same words might have been used of Union Pacific also. Its situation, as regards both new construction and prospective competition, is exactly similar.

Such conditions did not bar a prudent and gradual addition to the dividend; but they render such sudden abandonment of previous policy repugnant to all sound finance. When to this all but unprecedented increase in a dividend is added, from official sources, assurances that "the maintenance of these rates seems easily within the capacity of the properties"—it has to be conceded that the management has broken with its long-maintained policy of conservatism. Where, in the past they were regarded as an example to other railway boards, they have now set a pattern of recklessness. Their conduct is equivalent to serving notice to the world at large that business reactions, trade depression, and severe curtailment of railway profits, are, in their opinion, no longer to be expected.

Such is the attitude which accompanies a dividend increase that would almost certainly not have been made at all but for the wholly unexpected results of this season's harvests. That the management itself takes its assertions as to the future seriously, we do

not imagine for a moment. Unfortunately, there are plenty of other people who will take them so, and the Union Pacific directorate has itself to blame if the whole financial community is to-day accusing it of a huge stock-jobbing operation. Nor does it seem to us that such charges, even if backed only by circumstantial evidence, ought to be overlooked, any more than they were in the days of Fisk and Gould. Much has been written, these past few days, of the impropriety of directors speculating in the stock of their own companies. We greatly fear that the ethical side of the matter will not deeply impress our "practical men" of Wall Street, who have grown used, in recent years, to seeing pillars of the church using insurance trust funds to support their own "underwriting syndicates," and reputable bankers lending the benefit of their names to promoting schemes not far from swindling.

But even if ethics be ignored, an extremely practical question remains; it is, whether directors who speculate in order to get the benefit of a dividend policy on which they alone decide, can be trusted not to fix such a dividend policy as will favor their speculations. We regret to have to say that some at least of Union Pacific's directors are not above this suspicion. The two directors of the Amalgamated Copper Company in whose behalf, in 1901, a notorious stock-manipulator marketed \$22,000,000 Amalgamated Copper stock—the transaction is a matter of public knowledge—were engaged at the time in so handling the company's finances as to delude the whole public into the idea that the high dividends paid were warranted. When the directors' stock had been marketed, the pretence was dropped, and the dividends fell. These two men are members of the Union Pacific board; their presence there, with Mr. Harriman in the presidency, is enough at least to excuse this week's insinuations. Under the circumstances, it seems to us that men of unblemished reputation who also sit in the Union Pacific directory, ought themselves to be personally heard from in the matter.

A NORTH CAROLINA UPRISING.

There is in North Carolina an uprising of the press, the State officials, and law-abiding citizens generally, against Judge Lynch. Not within our memory has there been such plain talking in the South about mob law. No section of the Northern press has ever spoken out more strongly on this subject than our North and South Carolina contemporaries in regard to the triple lynching at Salisbury last week. It is universally regarded as a disgrace to the State; where the usual excuses are offered, they are indignantly repudiated. Indeed, no one can read the press of North Carolina

without feeling that the white South is at last realizing that lynching is no deterrent of crime, and that its sole effect is to demoralize and brutalize all who take part.

There are special reasons why press and public should feel outraged over the Salisbury lynching. The five negro prisoners were securely in jail; their trial had begun before a judge for whose election the people of Salisbury had voted not once but several times, and no one entertained any doubt of their conviction. The troops did have ball cartridges—not blanks, as at first reported—but were recreant to their duty. The officials of the jail deemed their work done after firing one or two shots into the mob and wounding one of its members—not an innocent bystander, as was announced. As the *News and Observer* puts it, "the more that is known of the crime the blacker it becomes, and the more certain it is that the crime might have been averted if the military, the sheriff, and the deputies had fired into the leaders of the mob." J. M. Julian, the editor of the *Salisbury Evening Post*, who bravely went into the mob to plead for the law, declares that no sudden passion, but a fixed determination to kill, actuated its members, who had no regard for legal processes. He adds: "It was all wrong. That the negroes who were lynched would have been convicted seemed certain. We realize that this is not the popular view, but it is the only right way of looking at the matter. The time will come, if it is not already at hand, when all the county will pay the penalty that inevitably follows contempt for the law."

It is to the *Charlotte Observer* that we turn for the strongest and bravest words about the State's disgrace:

Lynch law is on the increase in North Carolina. There is no negro vote, no negro legislation now; but there is a growing disrespect, not to say contempt, on the part of the white people for the laws which they themselves make. The mob hoots and jeers senators, judges, and other officers, whom it helped to elect, when they get up before it to expostulate with it and pray of it to observe the laws which it helped to frame. There must be an end to this, or worse days will come. Tufts of grass have been thrown at lynchers to no effect and volleys have been fired over their heads without result. When a North Carolina mob is fired into by deputies or the military, and a dozen or fifteen of the law-breakers are killed, there will be an instant end to mob law in the State. The longer the appreciation of the remedy is delayed the faster the disease will spread. It should be applied to the next mob that thunders at the gates of a jail.

For the crime itself the *Charlotte Observer* has no words properly to characterize it. "No subterfuge will cover the case"; "it is an instance of wholly unjustifiable blood guiltiness"; "apology or excuse for it there is none." Its words

are echoed and endorsed by the *Wilmington Messenger*, and the *Raleigh Evening Times* is not far behind; for it sees in the conviction of the leader, Hall, "cause for profound gratitude." The *Raleigh News and Observer* adds that "there are one hundred more who deserve to wear stripes for participation." Outside of the State, papers like the *Richmond Times-Dispatch* and the *Columbia State* are congratulating North Carolina not only on the conviction of Hall, but upon the possession of a brave judge and a right-minded Governor.

Only one newspaper of those which have come under our notice has disgraced itself by praising the mob. This unenviable distinction belongs to the *Atlanta News*, which dared to say of the negro murderers that, "Nothing short of the stake would have meted proper punishment to them for their awful crime, but the North Carolina patriots who handled that case had mercy upon them, and simply took them out and hanged them to trees and shot them to death." Commenting on this, the *Raleigh Evening Times* indignantly remarks:

Every decent white man in North Carolina, every citizen who is not a blood-thirsty ruffian, will resent most bitterly the statement of the *Atlanta News* that the slayers of the Lyerly family were lynched by North Carolina patriots. The utterance is so astounding that we cannot let it pass over in silence. . . . The first man arrested for the crime of Monday night has served his time in the penitentiary. He comes from another State, he is a common thug, and yet he is held up to the gaze of the public as a patriot of North Carolina. God save the mark.

It adds that the writer has no right thus to slander a State "which has suffered enough already." The *Raleigh News*, another outspoken paper, is certain that the Salisbury crime was made possible by the recent miscarriage of justice at Monroe, where two lynchers were allowed to go free on the merest technicality. "These prisoners," says the *News*, "were received as heroes, fresh from a conquering war. Men fell upon their necks at Monroe and wept for sheer joy. On the way home, they had an ovation; Wadesboro, in fact, had a sort of celebration when they returned." Writing from Salisbury, W. G. Briggs, the staff correspondent of a North Carolina paper, declares that the sudden prosperity of the neglected poor-white class has added to its menace. He believes that the Salisbury mob would have lynched whites as readily as blacks, and reports that it was composed of ignorant, thoughtless, unrestrained people, "with whom North Carolina must deal at once."

Finally, we are glad to record that Judge Long and Gov. Glenn have received letters of praise from all over the South, as well as from the North. Law-

yers and university men have united in lauding them for their patriotic stand against the lynchers. And the pulpit has not been lacking in plain speech.

THE GERMAN COLONIAL SCANDALS.

The report that the Prussian Minister of Agriculture, Von Podbielski, has been dismissed from office for his connection with the colonial scandals, will not come as a surprise to the German public. For some weeks past it has been evident that the Imperial Government could not long postpone a thorough-going housecleaning, much as it has so desired. Its colonial ventures have cost heavily in money and prestige, and now it must drain the cup of bitterness to the bottom and admit that it can no longer hold up its hands at American or English "grafting." The Prussian bureaucracy, justly famed for its integrity, if not always for its intelligence and enterprise, is now sadly besmirched. Yet the contamination is of colonial origin; the desire to get rich quickly out of the inferior races, whose destinies they controlled, seems to have brought about the downfall not only of Von Podbielski, but of others. Even more striking is the fact that the civil service rules seem to have been ignored. At least, it is charged, with considerable evidence in proof, that favoritism and the "pull" have done their deadly work here as elsewhere.

The recent financial collapse of the colonial administration was due to the Southwest African uprising and the failure to grasp its importance. A couple of million marks was the first war budget, and it was assumed that the triumphant march of troops from Germany through the revolted districts would be useful in stimulating popular interest in the colonies. When Bebel declared it would cost 50 millions of marks, he was denounced as extravagantly pessimistic. Now it is admitted that the war will cost several hundred millions, and the end is not yet in sight, though proclaimed as often as our own pacification of Samar, Leyte, and the Moro country. Gradually, the press and public discovered that the Colonial Bureau is hopelessly inefficient. Yet last winter, all rumors of corruption met with vigorous official denials. With the arrest at the end of July of Major Fischer, the chief of the clothing supply department of the Colonial Bureau, the Government confessed the existence of grave irregularities. Major Fischer's immediate superior, Col. Ohnesorg, found that his health required immediate treatment in a sanitarium, and the position of Von Podbielski became extremely critical.

It is a sordid enough bit of "grafting" which has now been uncovered. The firm of Von Tippelskirch & Co., in which at first Von Podbielski, and later his wife, had a large interest, entered

into close relations with the Colonial Bureau in 1896. In 1903 it received a complete monopoly in the supplying of clothing and equipments for the troops and officials in various colonies. Its profits have been from 30 to 40 per cent. above the normal business reward; the net earnings in 1905 were declared in the Reichstag last winter to have been at least \$500,000, on the basis of Government orders of two to two and one-half millions of dollars. This appalled the Reichstag, and it ordered a closer inspection of the product of the firm than Major Fischer had instituted. Gradually it appeared that, although Von Tippelskirch & Co. had pledged themselves to manufacture their supplies, they were practically middlemen, making on each pair of shoes \$1.30 profit, and selling to the Government for \$500 harness purchased by them for \$225. Naturally, the members of the firm were loudest in their insistence that German honor demanded the suppression of the South African revolt—at any price.

Major Fischer being a very worthy officer—he had been dropped from the Prussian and Saxon armies for financial irregularities before 1880—Von Tippelskirch & Co. were naturally interested deeply in his affairs. When the concern learned seven years ago that, owing to a family affliction, he had got heavily into debt, they were so much troubled that, out of pure kindness of heart, they raised for the Government inspector of their products a sum generally believed to be \$25,000. Von Tippelskirch has adroitly denied that the firm gave Fischer anything. He has admitted, however, that he advanced \$1,000, and will not deny that the other members of the firm contributed the remaining \$24,000. It is a curious coincidence that the year of these "loans," 1899, was the same in which the firm's Government contracts, originally made in 1896, were renewed. Herr von Tippelskirch omitted also, with genuine life-insurance forgetfulness, to mention that Fischer's Christmas in 1904 was made happy by a check for \$500, in token of the firm's affectionate appreciation of his splendid character. Another little trifle which escaped Von Tippelskirch's memory was his "yellow-dog" fund of \$5,000 for keeping the press contented and happy. In brief, this firm of contractors was quite as benevolent an institution in its way as any of our packing or insurance companies, or our manufacturers of army gloves and clothing. Even in "grafting" national boundaries now fail to mark distinctions.

There is, of course, nothing to be gained by asserting that this German scandal proves Americans not to be sinners above all. We should, rather, regret that the symptoms of governmental decadence are so widespread. Ameri-

cans, however, ought to ponder well these Berlin revelations in connection with their own colonial policy. The Von Tippelskirch-Fischer incident is only a part of the indictment of the Colonial Bureau. Its officials have been proved to be in many instances corrupt, tyrannical, and brutal. The stories of atrocities, of abuse of prisoners, of the degradation of native women, of open immorality, pour in from all sides and from nearly every colony, the trial of the Governor of the Cameroons for gross abuses being a case in point. According to all the current theories, German colonization ought to have been a great success. It was the undertaking of a monarchy secure in its control of the Reichstag, with a splendid set of officials and a perfectly developed and safeguarded civil service. If, under these circumstances, there is not only failure, but waste, extravagance, and corruption, surely a democracy which has to reckon with time-serving politicians should avoid all such demoralizing ventures.

EXIT THE AMATEUR SCIENTIST.

Dr. E. Ray Lankester, in his presidential address before the British Association, noted and deplored a falling off in the popularity of science. Few now follow "general science and natural history" as a recreation. "The field naturalists among the squires and country parsons," he observed, "seem nowadays not to be so numerous and active in their delightful pursuits as formerly, and the mechanics' institutes and lecture societies of the days of Lord Brougham have given place, to a large extent, to musical performances, bioscopes, and other entertainments more diverting, but not really more capable of giving pleasure, than those in which science was popularized." Dr. Lankester finds the cause of our disinclination to scientific pursuits partly in the growth of specialization, but even more in the competition of cheap and almost mechanical entertainment. "No doubt," he says, "the organization and professional character of scientific work are to a large extent the cause of this falling off in its attraction for amateurs. But perhaps that decadence is also due in some measure to the increased general demand for a kind of manufactured gaiety, readily sent out in these days of easy transport from the great centres of fashionable amusement to the provinces and rural districts."

The passing of the scientific amateur is due largely to the fact that science has become too difficult for him. In the good old days when physics was natural philosophy, and biology natural history, almost any one with a capacity for observation and the habit of carrying a notebook, might hope to make modest contributions to the classification of birds, plants, and minerals. It was the

day when the country gentleman was very likely to have his "cabinet of curiosities," and missionaries were sending back to their colleges strange implements and utensils, representing the culture of virtually unknown races. It was a time of discovery, and almost anybody might have a share in the work—at least, might contribute a lively curiosity. Moreover, science then dealt in the palpable. The average man may collect fur, fin, and feather, and render a very accurate account of the superficial aspects of animal and plant life. In England, perhaps, such nature-study may be on the decline; here, if the publication and sale of nature manuals be any indication, there has been a decided revival of interest in outdoor pursuits. But nobody to-day presumes to call himself even an amateur scientist merely because he makes old-fashioned studies in natural history.

To-day, science has withdrawn into realms that are hardly understood of the people. Biology means very largely histology, the study of the cell by difficult and elaborate microscopical processes. Chemistry has passed from the mixing of simple substances with ascertained reactions, to an experimentation on these processes under varying conditions of temperature, pressure, and electrification—all requiring complicated apparatus and the most delicate measurement and manipulation. Similarly, physics has outgrown the old formulas of gravity, magnetism, and pressure; has discarded the molecule and atom for the ion, and may in its recent generalizations be followed only by an expert in the higher, not to say the transcendental, mathematics. All this gives to scientific work what Dr. Lankester justly calls a severely "professional character." To-day, no layman may fairly hope to keep up, and all sorts of popularization meet with increasing difficulties. The well-meaning person who tries to "get up" any science will surely meet the fate of that judge who decided to renew his youthful studies in electricity. He went to the woods with an armful of books, but came back no wiser than before, the literature of the subject having become too abstruse for the lay intelligence. In short, one may say not that the average cultivated man has given up science, but that science has deserted him.

A further cause for the change is the mere familiarity of what used to be called "the wonders of science." In the boyhood of all but the youngest of us an air pump was a matter of curiosity; to-day our offices and apartments are cleaned by the vacuum process. We can recall when there was something awesome in the tiny spark of an electrical machine; now in rainy weather the discharge from the trolley slot illumines a whole street unnoticed, and our offspring amuse themselves with wireless tele-

graphy. The capacity for wonder has thus become jaded. It still exists, for it responded nobly to the sensational discovery of liquid air and the X-rays; but it requires some spectacular and rather valueless demonstration to give a fillip to the sated imagination of an age to which the marvellous has become the commonplace. When science serves us in our daily walk, we perforce assume towards it that impersonal attitude, that possibly inhuman lack of curiosity, with which we accept the daily ministrations of our butcher and baker.

If the appeal of science to naïve curiosity has greatly diminished, so also has its promise of an ultimate interpretation of nature. A generation or two ago men were sustained by what seemed a triumphant approach to final reality. They confused, to be sure, the mere accumulation of data with the far greater task of interpretation, but no one doubted that the explanation would be forthcoming. To-day science has assumed a more cautious and less hopeful tone. What we learned as ultimate principles in geology, astronomy, chemistry, and physics, only a few years ago, are to-day regarded as mere hypotheses, and partly discredited ones. In short, rightly or wrongly, the great scientists of the day proceed as if general theories were vanity, and the real work of science merely the accumulation of particular observations ever more accurate and minute. For this modesty, for this perhaps wise agnosticism, science should not be blamed; but inevitably the waiver of anything like a philosophical outcome diminishes the attraction of the subject for thoughtful outsiders.

Possibly a generation that has seen the demonstration of the germ theory and the discovery of radium is ungrateful to complain that science does not maintain so good a show as formerly; and yet one can hardly imagine that either bacteriology or radiology will ever become popular avocations. Indeed, the very magnitude of recent discovery baffles the unprofessional imagination and evades ordinary curiosity. We are content to let the masters work their white magic and profit by their lore, without profaning the mysterious precincts where the great discoveries are made. In fine, an age that as no other has utilized the practical applications of science seems in a large measure to take science itself for granted—to leave it contentedly to the large but special class of professional inventors and investigators.

We cannot agree with Dr. Lankester that this will necessarily diminish the study and enjoyment of visible nature. In fact, the asperity of science may have quite the other effect. People who have forgone the speculative and philosophical view of life, are very likely to be thrown back upon the enjoyment of their uninterpreted sensations and im-

pressions. It is noteworthy that in literature impressionism, symbolism, and other forms of unrestrained individualism, have followed the more or less scientific methods of a Balzac a Flaubert, and a Zola. One may expect a somewhat similar reaction as the dominion of the Darwins and Spencers wanes. The human spirit, in short, wants both cates and nourishment. If science fails to provide these, it will seek them elsewhere. It would be no strange thing if the baffled devotees of modern science should largely take refuge in that pleasant field of nature-study which not so long ago passed for science itself.

ON TRANSLATING THE OLD TESTAMENT.

It is singular proof how far present-day Biblical studies have moved from any literary or even humanistic position that, in spite of the rush of translators into other fields, practically no attempts are now made to present the Old Testament to English readers as a monument of literary art. The multitudinous labors upon it smell of the midnight oil, and, worse, of the dissecting-room, and the scattered fragments of the literature of the Hebrews lost what few æsthetic appreciators they had when their students ceased to be theologians and became critics. They are now a mock to Philistines; eyeless in the mill with the slaves of science; condemned to yield dubious facts to the framers of conjectured hypotheses. When Prof. Paul Haupt secured Dr. Horace Howard Furness for some parts of the English form of his *Rainbow Bible*, he rendered unique recognition to a suppressed fact, and, even then, Dr. Furness had only the liberty of putting in decent English the results of others; he was far from the creative labor of the primary translator. And when the "Tudor Translations" accepted the King James version as a belated comrade, it was as an English classic, and not as a primary translation.

Naturally, then, there is a general notion that the problem is solved and done, and that we have already in English amply adequate renderings of the Old Testament. Even the respectable authority of Dr. Lavendar can now be alleged in support of this view, and it is only a few months since an erudite writer in the *Outlook* based on it a plea for the abolition of the requirement of Hebrew from theological students. Since we had such excellent and sufficing translations what was the need of further toil and trouble, he urged. The time saved from the study of one of the bases of the Christian faith might be devoted to the cultivation of rhetoric or the pursuit of settlement researches.

This, of course, is absurd enough and exhibits ignorance of a very peculiar character in a cleric; but it amply illustrates the present point, and shows, first, that the Old Testament is supposed to have been adequately Englished so far as the sense is concerned, and, secondly, that no one ever seems to dream of translating it from a purely æsthetic point of view. Homer is attempted once, at least, in every decade, but from Lowth with his "elegant"

Latin versions it is a far cry to the beginning of the twentieth century.

A few words will suffice for the accuracy of the present vulgar renderings. In the Revised Versions, English and American, the New Testament is admitted, very generally, to be a fair substitute for the Greek original, though voices even now are becoming audible that the revision was carried out too classically for the text, and that the old version, following ecclesiastical tradition, came in many points nearer to the sense of its Hellenistic Greek. But the weakness of the Old Testament translation has been notorious from its first appearance. The times, apparently, were not then ripe, and the majority of the translators were able to vote down the few who really knew Hebrew. The general standard also of Hebrew scholarship was not nearly on a level with that of Greek. The real students of the language have always been few; they have studied more or less by themselves; and their knowledge has not been criticised and vivified in the rough and tumble existence of schools and colleges. Only in some such way does it seem possible to explain the persistence of hoary misconception on points of grammar, lexicography, and usage. If it had been the duty of the schoolmasters to teach Hebrew to classes of boys year by year, these things would long ago have vanished. As it is, not only are the more difficult books, such as Job, disfigured to the point of nonsense, but in the simplest prose there occur "howlers," which in Greek would work the sore unhappiness of a two years' schoolboy. The defect is not merely in insight and power of expression—the higher faculties of a translator—but in ordinary grammatical knowledge.

In this, it is true, there is great advantage for the teacher of Hebrew. His task would be much harder if the so accessible "pony" were of a better quality. As it is, the present writer finds it possible to give his classes complete freedom to compare, as much as they please, the English versions even of Genesis, secure that illegitimate use will be speedily apparent. The advantage is even positive. The value of a student's labors is brought home to him in a way otherwise impossible when he discovers that he has really got behind the current versions, and that the devotion of the "Little Minister" to "the original Hebrew" was something more than a jest. After a few chapters of Genesis have been read, it is an exercise of the first value to set a student to pick out of the English versions the innumerable blunders which his few months of study have taught him to avoid. Revising the revision may be turned to pedagogical profit as well as to ecclesiastical heart-burnings.

But where, in all this, does the mere English reader come in? "A plague on both your revisions!" he may say. "I will follow Dr. Lavendar back to the old Elizabethan wine of King James. It needs no bush. 'Old books to read,' said Sir Roger. There I have good English and old familiar cadences; if the Hebrews had a better book, I can't get to it, and I must be content." And the pity is that at present he must be content. Mr. John Payne learns Arabic to translate the "Arabian Nights," he learns Persian to translate Hafiz,

and Omar Khayyam; but no one learns Hebrew to translate Job, Ecclesiastes, or Isaiah. Yet less than a year's work would put Mr. Payne, for example, in a position to attack any of these, and there could not well be need with them of limited editions and private printing. The boon would be general to the English-speaking world; and the much-talked of "study of the Old Testament as literature," which now means hypothetical dissections and reconstructions, wild-oats theologies, and star-myth histories, all made plain to the meanest understanding, might approximate to its title.

The causes of this backwardness on the part of non-theological literary translators are probably three; reverence for the King James version as a well of English undefiled, which it is; belief that it is a good translation, which it is not; fear of popular objection to non-Levitical hands laid upon the ark, which is vain. After so many Levitical hands have worked their will with the sacred text—often with results of jumbled style only falling short of Mr. Kipling's imitation of the book of Mormon: "And the Lord spake unto the children of Israel, saying, 'Great Scott, what air ye about?'"—the people would rather welcome an æsthetically satisfactory and artistically reverent Englishing, even though wrought by uncircumcised hands. Such a translator would be free from all questions of dogma or of theological results to flow from his renderings. His whole care would be to translate adequately and beautifully, and for the rest he would have as little thought as though he were handling the Vedas or the Koran. He would need—and this might be hard—to shake himself free from the mystery which, for so many, seems to hang over the Hebrew tongue, and to recognize it not as any language of Paradise or system of strange symbols from the antique world, but as a very direct and vivid—most exact when grasped clearly and flexible when wielded easily—means of communicating human thoughts, one adequate to their deepest burdens and highest emotional flights, born in the desert and nursed on pastoral steppes, a child of mountain and river and plain, in touch with reality at all points, and rendering the instincts and yearnings of actual men, nomads and farmers, soldiers, seers, and rulers. Of course he would have to learn his Hebrew thoroughly and not to translate—as do so many—with an English version to right, a dictionary to left, and no grammar in sight; but that would be no terrible labor if pursued in the good old-fashioned way of writing prose from the first. And he would render, as nearly as could be, as one of the earlier Elizabethans; not with the later smoothness; some parts might call even for the commatic style of Malory. In this he would, perhaps, be driven to envy the freedom of these writers and their wide possibilities, narrowed for him, of words and constructions, such as modern translators of "Don Quixote" envy the license of Blount, which they dare not imitate. They, too, would give him rhythmic movements with which to reproduce the less than Saturnian metres of the Hebrews, and would teach him how to play on words without losing dignity or pathos.

Some measure of criticism he must needs use. The modern chapters and verses would

go, as well as the divisions of the Jewish lectionary. He would make no chapters of his own, but simply paragraph for the sense; thus aiding the English reader, yet retaining the primitive and Oriental monotony of unbroken narrative. But one thing must be for him as the abomination of desolation itself. His text may no critic chop up and assign to A and B or X and Y. He must take the work of the last redactor who wrought in any whit as an artist, and render that, difficult as it may sometimes be. If time has gnawed the text since it left those hands, he may mark the gaps, but hardly more. If the redactor left harsh passages, he also must be harsh; or, where that is too impossible, must seek some escape. Such a delirium of insane literalists as "Jehovah God" must be undreamable for him; the old version will here generally guide him safely. His method, in short, must be that of the great translations from the Greeks and Orientals when made by poets or artists in prose.

And great, surely, will be his reward who can carry out this task. The specialists—the theologians and the critics—have failed us, our only hope lies with the practised *littérateur*. Thus the Old Testament, put at last fairly before the English-speaking world, may come again to its own, and the problem, how to gain for the mass of the people a true view of it, as a multifarious mass of Oriental literature struck through with a red thread of purpose, so well stated by Mr. Arthur C. Benson in the *National Review*, will move far towards solution.

THE INVENTORY OF WASHINGTON'S LIBRARY.

Many of the papers in the old Fairfax Court House were scattered or destroyed by the Federal troops during the civil war, and among them was the Inventory of Washington's personal estate. It was, however, providentially, picked up and preserved by a Union soldier, and has now, after having been considered by Washington students for forty years as lost beyond chance of recovery, just come to light. It is a thin folio volume, fifty pages, bound in black morocco, lettered on the front "Original Inventory of Gen. George Washington's Chattels." The binding has probably been put upon it since the war. It may have been done twenty-five years or more ago.

The Inventory was first partly printed in 1860 by Edward Everett in his "Life of Washington." The document was too long for him to publish entire, and more than one-third (nineteen pages out of fifty) has never been printed. Moreover, the transcript furnished Everett "through the kindness of Mr. John A. Washington" was not accurate. Certain omissions were made through carelessness of the copyist, who, besides, appears to have found some difficulty in reading the handwriting of the original scribe. The Inventory has since been frequently reprinted, but always from the incomplete and imperfect one first published by Everett. According to this Inventory, Washington at his death owned a library of about nine hundred volumes, the value of which, as estimated by his executors, was \$2,134. What would Tobias Lear, Thomson Mason, Thomas Peters, and

William H. Foote, the appraisers, think if they could know that \$2,810 was paid for two volumes only, at the sale of Bishop Hurst's library in May, 1904!

Washington left all his books and papers to his nephew, Bushrod Washington. In his will, dated 1826, Bushrod divided the books between two of his nephews, John A. Washington and George C. Washington, and all the books, apparently, remained at Mount Vernon until 1848, when Henry Stevens, the bookseller, bought the portion which had been bequeathed to George C. Washington, and resold them to the Boston Athenæum, where they now rest.

The second portion of the library which had been left by Bushrod Washington to John A. Washington was, after having been exhibited at the Centennial Exhibition, auctioned off in Philadelphia in November, 1876. Of the collection then sold 282 volumes were said to have formed part of Washington's library. The largest buyer at that sale was John R. Baker of Philadelphia. In 1891 his library was in turn put under the hammer, and the books are now widely scattered.

As an important and most interesting Appendix to the Athenæum "Washington Catalogue," Mr. William Coolidge Lane, at that time the librarian of the Athenæum, but now the librarian of Harvard University, rearranged the Inventory as printed in Everett's "Life of Washington" (the original manuscript being then untraceable), classifying the books, and endeavoring to identify the imperfect or ambiguous titles and to trace as far as possible the present location of the books themselves.

The list of books in the original manuscript inventory now so luckily discovered was undoubtedly written down by one person as the titles were called off by another, and as the titles given are short and often curiously misspelled (especially in the case of books in foreign languages) the identification of the precise book or edition is often very difficult. For example, the second book on the list, Chamhaud's "Nouveau dictionnaire françois-anglais," etc., 1778, appears in the manuscript inventory as "Shamhead Dictionary 1 Vol. 4to, \$7.50." As printed by Everett this becomes "Skomhrand's Dictionary, 1 Vol., 7.50," a title which might have been very difficult to identify had not the book itself turned up in the 1876 sale.

The list as printed by Everett is continuous. In the manuscript the contents of each book-case is given. "Case No. 1," for example, had, on the bottom shelves, no doubt, the "American Encyclopædia," Johnson's "Dictionary," and other large quartos, while the upper shelves contained smaller octavos. The contents are given of eight book-cases numbered from 1 to 8, followed by a list comprising 125 volumes of various sizes, largely books on agriculture, which are marked "On the Table." After this are the headings "Pamphlets in No. 1," "Books in lower Part of No. 3," a few additional titles "In No. 5," "Maps, Charts, etc.," followed by four titles with the heading "Books Omitted."

Washington owned two copies of his own "Official Letters to the Honorable American Congress," in two volumes, 8vo., printed (without Washington's authority) in London in 1795. The editor, John Carey, a brother of Matthew Carey, the Philadelphia publisher, sent the two copies to Wash-

ington, accompanied by a letter of explanation, dated March 31, 1795, containing the following:

Respecting the plan of publication I have adopted, which I fear your Excellency will at first sight disapprove, and which is far from being satisfactory to myself—I would beg leave to refer to one of the copies above mentioned—the one in boards—containing some manuscript remarks expressive of the motives that influenced me on that occasion.

The copy with the manuscript notes by the editor (no longer "in boards," but rebound, probably by Washington's orders, in half calf) sold in the Hurst sale, in 1904, for \$2,810, the highest price thus far paid at public sale for any Washington book. Washington's autograph is on the title-page of each volume, but neither volume contains the book-plate. The other set, bound in tree calf, yellow edges (probably the binding put upon it in London by Carey, before it was sent to Washington) sold in 1876 for \$27, and was resold in Philadelphia, in May, 1895, for \$1,650. This set has Washington's signature on the title-page of each volume, and his book-plate in the first volume. The manuscript inventory shows that one set was in case No. 1, the other in case No. 5. Each set was valued by the appraisers at \$4. The set in case No. 1 does not appear in the printed inventory, having been overlooked by Everett's copyist.

Another book omitted by Everett's copyist is found in the manuscript inventory as "Hales contemplations, moral & divine, 1 vol. 8vo. \$50." This book was mentioned by Everett in his "Life" as still at Mount Vernon. It had belonged, he said, to Washington's father, and contained the autograph of each of his two wives, Jane and Mary. It came up in the 1876 sale, and again in the Baker sale in 1891. The leaf containing Jane Washington's name had meanwhile disappeared. The name Mary Washington is on the title-page and below in the early autograph of George Washington is written "Mother of G. Washington."

On February 5, 1788, Washington wrote to James Madison: "Perceiving that the Federalist under the signature of Puhlius, is about to be republished, I would thank you for forwarding to me three or four copies, one of which to be bound, and inform me of the cost." The Inventory shows two sets of "The Federalist," one valued at \$3, and the other at \$1.50. One of these, undoubtedly the \$3 copy, and the one which by Washington's orders was "to be bound," sold in 1876 for \$100, and was resold in February, 1891, for \$1,900. It was one of the rare "thick paper" copies, and each volume contained Washington's autograph and book-plate. Vol. I. also contained notes as to the authorship of the several essays, in the handwriting of James Madison.

Washington subscribed for twenty copies of the first edition of Barlow's "Vision of Columbus." This was done, undoubtedly, as a financial help to the author. At the time of Washington's death two copies remained. No one of the twenty copies can now be positively identified. Louis XVI. was even more liberal. His name occurs in the list of subscribers for twenty-five copies of the book.

On May 6, 1792, Washington acknowledged

the gift from the author of fifty copies of Paine's "Rights of Man." They were sent, no doubt, with the expectation that Washington would distribute them among his friends. That he did not do this is shown by the entry in the Inventory: "Tom Paynes Rights of Man 43 vols. 8vo. \$15.00." Even in 1800 it was Tom Paine, used as a term of opprobrium. In no other case is the given name of any author mentioned in the Inventory. L. S. L.

OXFORD IN VACATION.

OXFORD, August 6.

To-day is the August Bank-Holiday, when every true-horn Englishman's summer outing is supposed to begin, from the King's to the schoolboy's. Town is making, or preparing for, its exodus. For Gown the holidays formally began a month and more ago. Yet some half a hundred 'unfortunate candidates for the haccalaureate were left to pass their *vivâ voce* barely more than a fortnight ago, and a considerable number of unfortunate dons were fettered to that function. By nine o'clock in the morning the High in the neighborhood of the New Schools had assumed something of a faint reminiscence of term. Young men were gathering, dressed under the hoh-tailed gown of the commoner in the prescribed black coat and white tie, which is the vague relic of the former ecclesiastical character of the university student. Their solemn faces showed clearly their sense of the impending terror, and their exchanged prognostications were of the gloomiest description.

The *vivâ voce* examinations, which supplement the written papers, are formally open to the public, just as in some of our American colleges the candidates for the haccalaureate, on being presented for their degrees, are still pronounced *publico examine probatos*. But the public has ceased in Oxford to exercise its privilege. In the great and dignified room where the *vivâ voce* in *Litteræ Humaniores* was carried on, a double row of chairs stretched the full length of the apartment, and across one end, but I was the only occupant of them, save for one or two pale candidates, who entered somewhat before their appointed times and dropped into seats as near the door as possible. Behind a long table were seated three examiners, occasionally increasing in number to five, all in the master's gown and hood, and these not invariably in the most neat condition. Toward the end of the period one of the two University Proctors dropped in, and was received with official courtesy. He wore hands, and that more elaborate arrangement of gown which, I believe, was once merely the full-dress gown of the ordinary M.A.'s, whose representatives the Proctors especially are in the government of the university. On the other side of the table from the examiners were placed five chairs for the candidates, though each one of these in turn had the whole side of the table to himself, and was ordinarily subjected to catechism by only one of the examiners.

The examination was not as brief nor as simple as the famous one recorded of Lord Eldon, who was asked a single question each on Hebrew and history: "What is the Hebrew for a skull, sir?" "Golgotha."

"Quite right, sir, quite right. And who founded University College?" "King Alfred." With this answer, more loyal than veracious, his examination was happily ended. The examinations the other day were most of them brief and simple, less than fifteen minutes each being spent on most of the victims. "Ah, Mr. Smith, what can you tell us about Lucullus?" "He was a distinguished Roman, who held command in the East." "Against whom?" "Mithridates." "Quite right. And do you remember who succeeded him?" "Pompey." "Yes. And can you recall the names of the two laws that gave Pompey his extraordinary powers?" "No-o-o, sir, I can't." An examination in philosophy was, however, much longer and more searching. It is proposed, I am told, to give up these ancient oral examinations, except when the precise rank of a candidate from his written papers is in doubt.

The ceremony of conferring degrees for the last time before the new academic year took place only a week ago, in the beautiful and stately old Divinity School, where the disputations in divinity are still delivered, though without opponents, by candidates for divinity degrees, and usually with only the Regius Professor of Divinity to listen to them. In this respect divinity only shares the lonely fate of the *vivâ voce*. It was a less tense atmosphere the other day than when Archbishop Cranmer, as a prisoner, held his own in that same hall against the combined forces of the Romanist divines of Oxford and Cambridge. Last week two long rows of backless oak benches were set out along each side of the room, from the end door into "the Pigmarket" up to the loftier seats behind the railing, in front of which, on the floor, were the benches for the assembling Doctors and Masters. In the high seats were some privileged spectators; on the backless benches to the right of the entrance sat ungracefully the candidates for the master's degree; opposite them the candidates for the baccalaureate, and huddled against the wall behind the benches stood the unauthorized onlookers. Among the few Doctors at the other end, nearest the Vice-Chancellor's raised chair, in the differing glory of their stellar splendors, it was interesting to notice the effective scarlet and gray habits of the new doctorates in Letters and in Science. The dignified Bedel, carrying his portly silver staff wrong end up (it is carried right end up only before the Chancellor and the King) elbowed his way through the throng at the door, pronouncing, as he advanced, the prescribed Latin formula in the prescribed gentle tone, "Intretis in Congregationem, magistris, intretis," and then followed the two Proctors in their black and white, and the Vice-Chancellor in his scarlet and black. He took his place in the raised chair at the further end, with the Proctors lower down to right and left, and Doctors and Masters flanking them. There appeared to be hardly more Masters than enough to make the statutory quorum of nine for the conferring of degrees. The Vice-Chancellor presented at a distance a striking likeness to that old and rigorous Chancellor, the ill-fated Archbishop Laud, who may have sat in Congregation in that place; but Laud was a strict formalist, and I gravely doubt whether he would have allowed himself, or any other D.D., to say nothing of

a Vice-Chancellor, to wear the light gray trousers that peeped out when the presiding dignitary's gown fell slightly open. A few items of formal business, disposed of, I suppose, by the house sitting as Convocation, were quickly run through in fluent Latin, silence on the part of the members marking assent. Authorization had to be given to the affixing of the University seal to certain leases, and the unexpected appearance in the midst of the learned tongue of familiar English phrases—"cum The Associated Portland Cement Manufacturers"—caught the ear of the audience and raised subdued laughter. After each statement was rattled off by the Vice-Chancellor he added, snatching off his cap, "Placetne vobis, Domini Doctores? Placetne vobis? Placetne vobis? . . . Sigillum apponatur." It was curious to notice throughout this and the following part of the function the academic freedom that prevailed in the matter of the pronunciation of Latin on the part of the different speakers. Everything seemed to "go," from "Roman" to "English."

Then followed the ceremony for which all the audience were waiting, according to the forms that have been considerably shortened since the older days, but yet retain many elements of historic interest, especially to a Western observer. The Vice-Chancellor and the Proctors, the one representing the external authority, the others the joint right of the associated Masters, alone wore their caps during the entire ceremony, except at moments of salutation—the Proctors, however, removing theirs when the Vice-Chancellor lifted his. The form of admission to the Master's degree is more elaborate than that for the baccalaureate, marking the especial importance of the Master as received into full membership in the University as a legally constituted society of scholars. The Masters are admitted in groups of four only; the Bachelors all in a lump, after presentation by colleges. The Masters kneel before the Vice-Chancellor, and at the conclusion of the formula are touched on the head by him with a copy of the New Testament, "in nomine Domini, Patris, Filii, et Spiritus Sancti," as marking the originally ecclesiastical character of the function; the Bachelors stand in a confused group, and are admitted in a briefer formula. The pledge required from the Masters is more elaborate than that required from the Bachelors, as they alone are admitted to a share in the government of the University; but they are no longer compelled to promise, as they were from 1334 to 1827, not to recognize as a University any other institution in England except Cambridge, and especially not to lecture nor to listen to lectures in Stamford as a University. The Masters alone are said to "commence" (*incipere*) in their respective faculties (that is, of course, to commence teaching), the Bachelors being given license to read only. The Masters, after their degrees are conferred, are ushered out of the room by the Bedel to don their new gowns and hoods, and are then formally escorted in again in a group to make their silent bow before the Vice-Chancellor; the Bachelors are pointed the way out, and there abandoned to their own devices. Custom is in wait for them there, though, and lays its unwavering hand upon them. One

of the servants of his own College claims the right to bring the new Bachelor his gown and hood, and invest him with them on the spot, and to receive as tip therefor a sovereign.

Correspondence.

"THE SECRET OF THE TOTEM."

TO THE EDITOR OF THE NATION:

SIR: The subject of Totemism is naturally unpopular, being complex, arid, and connected with that state of savagery from which, as Thackeray's Miss Tickletoe says, we willingly withdraw our view. Thus, few persons can be interested in my remonstrance with the critic of my "Secret of the Totem," in your columns for May 31; three copies of the critique have to-day reached me. Permit me to quote my critic textually. He says:

The book presents as the "secret" a fact known for centuries, and but lately worked out into a sober monograph by two Russian scholars. Further, Mr. Lang, in order to the upholding of his thesis, which, in a word, is simply that the totem was a kind of *Schriftart*, as Picker (*sic*) and Somlo called it in the monograph referred to, has to ignore all the recent facts collected in defiance of his theory. This he does with his customary coolness. The savages of Central Australia do not support his view, so he calmly advances them in the scale of civilization, and regards them as too advanced to be usable—for his theory. Mr. Frazer, who first revamped his old theory of totemism into a clumsy adaptation of modern views, subsequently, in several illuminating articles in the *Fortnightly Review*, threw over the notion that matriarchy necessarily precedes patriarchy; but this result, Mr. Lang in turn, throws over, for, as he admits, it invalidates his argument. Inheritance of the totem does not always come first from the mother—then away with the vile body which indicates this; or, in Mr. Lang's words, "I am unable to accept this tribe as an example of the most archaic state of affairs extant."

I had, in fact, advanced my theory of the *origin* (not the complete "Secret") of the totem, in various places, such as the *Athenæum* and *Longman's Magazine*, before "Picker" (as your critic amusingly styles M. Pikler), with another "Russian scholar," published his "sober monograph," which is quoted freely in my book. I also put forward my ideas on the whole evolution of totemism in "Social Origins" before I had so much as heard that there was any "Picker." But my idea is *not*, as my critic avers, "simply that the totem is a kind of *Schriftart*," in origin; that theory I am obliged to oppose. In origin the totem was no *Schriftart*, I think, but a name, and part of a system of naming. This opinion, this portion of the whole "Secret," may be "a fact known for centuries," since, as I say in my book, the theory that totemism arose in the differentiation of groups was put forward by Garcilasso de la Vega, an Inca by the maternal side, in his "History of the Incas." Of this fact I apprised Mr. J. F. McLennan, thirty-six years ago! Garcilasso, however, did not work out his theory into any of the details. To do this has been my aim: that is, to unravel the whole complex evolution of totemism, as far as it exists in Australia. My general theory is novel, of course; it has *not* "been known for centuries"; though centuries

ago, Garcilasso made a guess at one portion of my hypothesis.

My reviewer declares that, to uphold my thesis, I deliberately ignore facts, and (if I correctly interpret him) that this is my common practice. I have, he says, "to ignore all the recent facts collected in defiance of my theory," and "this I do with my customary coolness." With all deference I venture to suggest that the charge, as I find no vestige of a basis for it in my book, must be made in consequence of some misconception on the part of my reviewer. He quotes, from my preface, the statement that "I am unable to accept this tribe," the Arunta, "as an example of the most archaic state of affairs extant," but he does not quote the reasons which I give for my inability to regard the tribe as primitive. The reasons are many, and many inquirers, English and Continental, here agree with me. I am conscious, at least, of having ignored no recently collected facts bearing on the subject, of which I was aware when I wrote the book reviewed; though, in the present year, interesting facts have been collected which I could not notice before they reached me, in private letters from Western Australia. (April, 1906.)

If the critic means (as he appears to mean) that I "ignored" the facts from central and north central Australia, I reply that I carefully criticised them in two chapters (iv. and xi.), devoted to the discoveries and theory of Prof. Baldwin Spencer, and to a then recently published magazine article by Mr. J. G. Frazer. To state, to criticise, and, as a result of criticism, to decline to accept a *theory*, is not to "ignore facts." I have again criticised Professor Spencer's most recent statement of his theory, in the *Journal of the Anthropological Institute*, for July, 1906. Far from "ignoring the facts," I state and accept the facts, while giving my reasons for differing from the interpretations of them suggested by Professor Spencer and Mr. Frazer. In taking this course I agree with several British and foreign students of distinction.

I am said "calmly to advance the savages of central Australia in the scale of civilization," *because* "they do not support my views." I disclaim the imputed motive. These savages, according to Professor Spencer himself, and Mr. Howitt, are in about the fifth stage of what these students, and I, look on as progress in social organization. How, then, can I regard these tribes, with Professor Spencer, as "primitive" in respect to social organization? They might, of course, retain archaic survivals; I do not deny *that*; but I advance reasons, which, so far, have not, to my knowledge, been refuted, for thinking that, as regards totemism, these tribes are not primitive, but decadent and aberrant.

The notion "that matriarchy" does not "necessarily precede patriarchy," was not held by any one of our best authorities—for example, by Mr. Frazer, Mr. Tylor, or Mr. Howitt—till Professor Spencer discovered the organization of the central and north central Australian tribes, and even then Mr. Tylor, certainly, and, I think, Mr. Howitt, no more abandoned their previous opinion than I have done. In this country we were previously all agreed that, among totemic peoples, "matriarchy" was prior to "patriarchy." But some students

who look on these central and northern tribes as specially "primitive," have been led to the recently proposed opinion that one tribe may start with "patriarchy," and another with "matriarchy." On this theory, and not otherwise, the central and north central tribes—though confessedly far advanced in social organization—may, as far as their "patriarchy" is concerned, be as "primitive" as the tribes with "matriarchy." I do not, as my critic says, "throw over this result, *for*, as I admit, it invalidates my argument,"—if "*for*" here means "*because*." I might as well say that students who differ from me accept "this result," *because*, if they do not, *their* argument is invalidated. I reject, for myself, the new opinion that "patriarchy" and "matriarchy," among these tribes, are equally primitive, because, among other reasons, these tribes with "patriarchy" for the more part retain the most undeniable traces of a previous state of "matriarchy." Into this part of the subject, as Mr. Frazer's new opinion only came to my notice after my book was in type, I had not the opportunity to enter with desirable minuteness. I have since found another opportunity.

Let me express my regret that I have had to offer so long, and, doubtless, so dull an explanation.

ANDREW LANG.

London, July 30.

[We did not impugn Mr. Lang's honesty in stating that he coolly ignored facts; it would have been a mere paraphrase had we said that he easily disregarded them. We did say that he deceived his reader in publishing his book under the caption "The Secret of the Totem," since there is nothing to indicate that the totemism meant is only, as he now says, "totemism, as far as it exists in Australia." Dr. Pickler (the misprint "Pikler" is doubtless very amusing) had previously advocated the theory that "the germ of totemism is the *naming*," in contradistinction to the mystical theory of Frazer, and the purchaser of a fresher "Secret" might well expect to find something besides a mere modification of Pickler's view. Spencer and Gillen have shown that descent in the female line has not always preceded the counting of it in the male line, and Frazer has admitted that "the common assumption that the inheritance of the totem through the mother always preceded inheritance of it through the father need not hold good." Mr. Lang in the "Secret" himself admits that he has throughout argued on that very assumption, and that it is this assumption which is "fatal to the Arunta claim to primitiveness."—ED. NATION.]

PUNCTUATION.

TO THE EDITOR OF THE NATION:

SIR: For some readers by far the most interesting piece in the August *Atlantic* was Mr. Garrison's article on "A Dissolving View of Punctuation." It brought back to my mind the time when I used to gaze with a kind of awe at my father's library

and wonder—not how the men got their ideas for all those books, but how they ever managed to punctuate them!

I hoped Mr. Garrison was going to give a smart rap over the knuckles to those writers who obscure the sense of what they write, by their slap-dash use of the dash—often putting such a succession of them that it is hard to pick out the true meaning. And by the by, what rational justification is there for the use of comma and dash, as in the first sentence on p. 269 of the August *Atlantic*? "Ten or a dozen years ago,—the exact date is here immaterial,—an enterprising," etc. I happen to have before me two text books issued by the same publishing house: one of them always precedes the dash by a comma, while the other one omits the comma; and this surely seems to be the better way.

As to the interrogation point, every one who reads aloud must have learned to wish that we were as sensible as the Spanish are, in putting the question sign at the beginning of the sentence, so that the reader might instantly give the proper inflection to his voice. Another reason for putting the sign at the beginning is that sometimes the question affects only the first part of the sentence, the latter part winding up with an unquestioned declaration of fact, thus making it exceedingly awkward to carry the question-tone so far.

The Germans have such an extremely helpful use of the hyphen that it is strange it has not been adopted by other nations. A simple example is: "Owing to the wind- and snow-storm," which is not always the same as "the wind and snow-storm." But what we have taken over from the Germans in our Latin and Greek texts is the comma in front of every relative pronoun. Many of your readers can no doubt recall times when this vicious German comma for awhile completely obscured the sense by divorcing ideas that no man should put asunder. The Germans would not make the distinction that the comma makes for us in these two sentences: "Parents, who are the natural protectors of their children, must not let them govern themselves to their own hurt"; and: "Parents who let their children govern themselves are very culpable."

Have not some of your readers at times felt the need of a mark of less weight than the comma? If one writes: "Mary Jane and Jack have gone blackberrying," have two or three gone? If we write: "Mary, Jane and Jack have gone," are we giving Mary information about Jane and Jack? or have all three gone? If we put it so: "Mary, Jane, and Jack have gone," we do not punctuate as we speak, for no one says "Jack have gone." We *speak* a comma after Jack, whether we write one or not—and I do not think I ever saw the comma separating the last term of a series from the verb common to them all. The absence of the comma there seems to unite the last member too closely to the verb, giving it an unfair advantage over the preceding members of the series: if we put the comma, it seems to jar the terms too far apart.

If an appositive clause finds place in such a series, the matter is made still worse. To take a classical example, we read in "De Amicitia," 101; "Senes illos,

Œ. Paulum, M. Catonem, C. Gallum, P. Nas-icam, Ti. Gracchum, Scipionis nostri soce-
rum, dileximus." Now count your old men.
Five, or six?

In such places the parenthesis would re-
move ambiguity, thus: "Ti. Gracchum
(Scipionis nostri socerum)"—and then
comes the awkwardness of the comma, as
shown above.

ADDISON HOGUE.

Lexington, Va., August 14.

HISTORICAL PARALLELITIS.

TO THE EDITOR OF THE NATION:

SIR: While historical "parallelitis," as
you term it in your interesting article on
the Russian crisis, is an insidious malady,
is it not the case that the really important
point is not so much that one of our news-
papers is suffering from it, as that the
Russian people are? You blame the *Times*,
for which I hold no brief, for seeing in the
reported understanding of the Czar with the
Kaiser and the Emperor of Austria a
parallel to the relation of Louis XVI. with
the same Powers in 1792. The parallel may
be fallacious, but it may yet be extremely
effective if the members of the Duma had
something of the sort in mind when, after
their recent dissolution, they addressed
the Russian people as follows:

Our Government have gone to such
lengths that the Austrian and German Em-
perors have placed their troops at the dis-
posal of the Tsar's Government for war
against the Russian people. This is clearly
conspiracy with foreigners against the
Fatherland. This is a state of treason on
the part of the Government . . . etc., etc.

Was it not for treason of precisely the
same character that, rightly or wrongly,
Louis XVI. was beheaded? J.

Notes.

Edith Wharton will contribute the serial
story of Scribner's for 1907. The title of
the story is not stated.

L. C. Page & Co. will soon have ready a
new edition of "The Cities of Northern
Italy," by Grant Allen and George C. Wil-
liamson.

The latest section of the "Oxford Eng-
lish Dictionary" to appear carries that
great work from *Ph* to *Piper*, the editor be-
ing Dr. James A. H. Bradley.

The Oxford University Press is preparing
"The Oxford Anthology of English Litera-
ture," by G. E. and W. H. Hadow, in three
volumes, the first of which will be ready
this month.

D. C. Heath & Co. announce two new vol-
umes in the Belles-Lettres Series: "Select
Poems of Robert Browning," edited by
Richard Burton, and the "Select Poems of
Tennyson," edited by Archibald Mac-
Mechan.

Despite his seventy-seven years Tolstoy
is husily engaged on a new hook, to be call-
ed "Divine, Human." It is concerned with
the Russian Liberal movement in the eigh-
ties and nineties. Another work of his will
take up Lamennais.

Thomas Whittaker is publishing the
"Reminiscences of a Missionary Bishop,"
which contains the experiences for a period
of forty years of Bishop Tuttle, presiding

bishop of the Episcopal Church, formerly of
Utah, now of the Diocese of Missouri.

The *Four-Track News*, hitherto issued by
the New York Central Railway, will now be
published independently as the *Travel
Magazine*, by Walter A. Johnson, formerly
of Doubleday, Page & Co., and others. The
size of the magazine will be enlarged.

Bertram Dohell has issued a new edition
of "The Poetical Works of Thomas Tra-
herne," with an Introduction explaining
how the MS. was found, and a prefatory
poem by Mr. Dohell himself. He also an-
nounces that the "Meditations" are soon to
be published in a separate volume.

"Shakespeare's Complete Works" will ap-
pear this autumn in Houghton, Mifflin &
Co.'s Cambridge Poets Series. They will
also bring out the "Complete Poems of
Edward Rowland Sill" in a single volume at
a popular price. Sill's work has long need-
ed to be thus collected.

The Century Company will publish this
autumn the "Addresses of John Hay" and
Frederick Trevor Hill's "Lincoln, the Law-
yer." The new Thumb-nail hooks will be
E. E. Hale's "The Man Without a Country,"
Emerson's "Friendship" and "Character,"
and the Proverbs of Solomon.

John W. Munson's "Reminiscences of a
Moshy Guerilla" will soon be brought out
by Moffat, Yard & Co. Mr. Munson joined
the Partisan Rangers at the beginning of
their career, and stayed with them to the
end. In writing his memoirs he has had the
assistance of Col. Moshy and others of the
command.

Seven *Lieferungen* have now appeared
of the new revised edition of Wülker's
"Geschichte der Englischen Literatur"
(Lemcke & Buechner), which will be com-
pleted in fifteen parts. Besides the sober
account of English literature contained in
this work, it is valuable for its facsimiles
of MSS. and early books. American authors
receive proper attention.

"Les Classiques Français," the tidy and
rather gay little hooks issued by Dent and
Putnams, will soon mount to a consider-
able number. Two late volumes include
Dumas's "La Tulipe Noire," with a Pref-
ace by Emile Faguet, and La Rochefou-
cauld's "Maximes," under the care of Paul
Souday. The "Maximes," in particular,
make a delightful little hook.

E. P. Dutton & Co. will soon have ready
"Court Life in the Dutch Republic," 1638-
1689, by the Baroness Suzette Van Zuylen
Van Nyvelt; "Reason in Architecture," by
T. G. Jackson, and "Sidelights on the Home
Rule Movement," by Sir Robert Anderson.
Sir Robert is the son of Matthew Anderson,
who was crown solicitor in Duhlin.

The Baker & Taylor Company announce
the following publications for this autumn:
"Max Fergus," by Owen Johnson; "Ka-
trina," by Roy Rolfe Gilson; "Power Lot,"
by Sarah P. McLean Greene; "Mr. Pick-
wick's Christmas" and "A Christmas Carol,"
with illustrations by George Alfred Wil-
liams; "A History of Architecture," by
Russell Sturgis, and "Lady Hollyhock and
her Friends," by Margaret Coulson Walker.

Another volume of the Dent-Putnam
Greek and Latin classics is made up of
Plato's "Euthyphro, Apology, and Crito,"
with Introduction, Translation, and Notes
by F. M. Stawell. Were the type only a

bit more generous, so as to invite read-
ing, for example, in the cars, this would
be almost an ideal publication. We have
long needed such an edition of the princi-
pal classics, designed for those who still
carry a little baggage of Greek and Latin,
but are glad to substitute for the dictionary
a fair translation on facing pages.

In the *Harvard Quarterly Journal of
Economics* for August Prof. W. F. Willcox
discusses the "Distribution of Immigrants,"
and contributes some solid facts to the
controversy—too often frothy—on immigra-
tion. He examines the common impres-
sion that the foreign-horn tend to collect
in the great cities, and that the most il-
literate of them tend especially to huddle
there. This question he handles with the
coolness of a trained statistician, and with
careful use of the available figures; and
the outcome is to dispose pretty complete-
ly of the prevailing notion. True, there is
a larger percentage of the foreign-horn in
the cities; but this is conspicuous chiefly
in the seaports, and is due to the simple
fact that they arrive in those ports and
cannot get away from them at once. The
ports of arrival act as reservoirs, receiving
a steady inflow, but discharging a steady
outflow, and full only because new currents
are always coming in. In the fiscal year
1900, "within a period averaging six months
after their arrival at New York city, not
less than 107,000 out of 134,000 immigrants,
or four-fifths of the whole number, had left
that city, and dispersed over the country."
During the decade 1890-1900 two-thirds of
the Italian addition to the population of
New York left that city before its close.
The currents are steadily flowing from city
to country. "All the facts have been found
consistent with the theory that the larger
proportion of foreign-horn in our cities is
due to the fact that nine-tenths of them
arrive in cities and that it takes them a
long time to disperse from these centres."
The notion that among the immigrants
those who are illiterate tend especially to
congregate in cities seems to have no het-
ter foundation. In the State of New York
the foreign-horn in the cities have a lower
per cent. of illiteracy than those outside
the cities, and Professor Willcox believes
that in other States similar results would
be found.

South America is the main subject of
the *National Geographic Magazine* for Au-
gust, the opening article being a forecast,
by Mr. Chas. M. Pepper, of its condition
fifty years hence. The Argentine Repub-
lic seems to him to have the most promis-
ing future from its natural resources, be-
ing another Mississippi valley, and he be-
lieves that in 1956 Buenos Ayres will have
a population of two and a half millions.
He predicts a great overflow of capital
from the United States which will be used
largely in the construction of railways.
Professor Bailey of Harvard gives an ac-
count of an exploring trip from the eastern
slopes of the Andes to the Amazon val-
ley, and of the savages who inhabit the
region through which only one white man
had ever before passed. An interesting
spot where three republics meet, Brazil,
Argentina, and Paraguay, the falls of Ig-
uazu, rivalling Niagara in grandeur and
excelling it in beauty, is described by
Marie R. Wright. In his account of his
fourth visit to Mont Pelée, made last Feb-

ruary, Prof. Angelo Heilprin says that he thinks he has solved the problem presented by the great obelisk of rock which after the eruption rose above the cone of the mountain a thousand feet, but is now shattered. The view generally held by geologists and ably elaborated by Professor Lacroix, chief of the scientific investigation committee sent out by the Academy of Sciences of Paris, is that it represented a rapidly and recently cooled highly acidic lava, whose tension and viscosity were such as to permit the solidification at or about the time of extrusion. In other words, it took the place of the free flows of lava which usually accompany volcanic eruptions. Professor Heilprin maintains, on the contrary, that it was an ancient volcanic plug, which bore no relation in its formation to the newer phase of eruption of the volcano, and was lifted bodily, as the result of extreme volcanic stress, in the manner of the great block of the Puy Chopine, in the Auvergne. The illustrations of this and the other articles are numerous and well-chosen, and there is also a map of South America with some useful facts and statistics in the margin.

It is shown in the *Philippine Journal of Science* for June that the waste of the stripped *abaká* (Manila hemp) offers excellent prospects for paper manufacture, as do certain other Philippine fibres and grasses. The most interesting article of this number, however, is undoubtedly a discussion of the bubonic plague in Japan by the bacteriologist whose name has come to be famous in connection with this disease, Shibasaburo Kitasato, head of the Institute for Infectious Diseases at Tokio. It was Dr. Kitasato who first organized the rat-killing campaign as a means of both locating and combating the plague—a system which has been followed with success in Manila, where the health authorities keep in close touch with the Japanese laborers in the same field. Even when there is no plague, 3,000 to 4,000 rats per day are bought and "post-mortemed" in Tokio, a measure of prevention which in 1904 located a case of infection in a steamer from Hongkong and enabled the authorities to take action before a single human being had been infected. In Tokio, since 1900, 4,820,000 rats have been caught and killed, at a cost to the Government of over 160,000 yen. But Tokio's plague epidemic of 1902-1903 cost the city 320,000 yen; how vigorously and thoroughly the Japanese health authorities have fought these epidemics is shown by the fact that the number of patients in Tokio was only 15, giving an expenditure of 21,333 yen for each patient. The same has been the case in the epidemics in Yokohama, Osaka, and Kobe, and the three epidemics in the past six years have claimed only 513 recorded victims (besides a number undoubtedly not reported). Whole districts of Tokio, for instance, were encircled with zinc-sheeting fences, running a foot below ground and three feet or more above ground, to retain the rats till they could be killed. Kitasato calls attention to two things of importance to all cities which are threatened by this disease. First, he shows that rats cannot be exterminated by any method as yet known; and, secondly, he points to the large area of southern China, to India, and the British free ports as the focus of the

disease and as places where nothing is done to prevent its spread to other parts.

Edward B. Reed of Yale University makes an interesting discovery in regard to the celebrated lines on "Sidney's sister, Pembroke's mother," which have been attributed both to Ben Jonson and to William Browne. The common statement is that the verses were first printed anonymously in Osborne's "Traditional Memoirs on the Reign of King James," 1658, thirty-seven years after the death of the Countess of Pembroke. Earlier than that, it is said to appear first in a MS. of the middle of the sixteenth century, in Trinity College, Dublin, under the signature "William Browne," and also in a collection of Browne's miscellaneous pieces, in Lansdowne MS. No. 777, dated 1650. Mr. Reed thus presents his own discovery in a letter to the *Athenæum*:

In Camden's "Remaines concerning Brittain: But especially England, and the Inhabitants thereof. The fourth Impression, reviewed, corrected, and increased, London, 1629," p. 336, is the following:

On the Countess Dowager of Pembroke.

Under this Marble Hearse
Lyes the subject of all Verse;
Sidney's sister, Pembroke's mother,
Death, ere thou hast kil'd another,
Faire, and learn'd, and good as she,
Time shall throw a dart at thee.

Marble piles let no man raise
To her name, for after-dayes;
Some kind woman borne as she,
Reading this, (like Niobe)
Shall turne Marble, and become
Both her mourner and her Tombe.

In the Trinity College MS. line 1 reads "Underneath this sable hearse"; line 4 reads "Death, ere thou hast slain another," with the variant "killed."

This epitaph is printed in the "Remains" without its author's name. It follows immediately an epitaph on Sir Philip Sidney which has this brief introduction: "Sir Philip Sidney . . . hath this most happily imitated out of the French of Mons. Bonivet, made by Joach. de Bellay, as it was noted by Sir George Buc in his Poetica." Evidently the writer of the lines on the Countess of Pembroke was not known, or his name also would have been given. The epitaph is printed eight years before Jonson's death, yet apparently he never claimed it. This is certainly a point in favor of Browne's authorship, for Jonson was not the man to hide his light under a bushel.

The quatercentenary celebrations of the University of Aberdeen are to begin on the 25th of September, with a chapel service, and terminate on the 18th with a students' symposium, which probably means a *Kneipe*. On the 27th, King Edward is to be present to inaugurate the new university buildings, and Lord Strathcona, the Chancellor, gives a banquet in a specially constructed pavilion to the invited guests and all the present and past members of the University, to the expected number of about 2,500. Receptions, athletic sports, banquets by the civic authorities and others, and excursions fill up the remaining time.

The Council of the Section of Anthropology of the British Association has presented a resolution in which it is urged that the governments of the South African colonies should collect and preserve the knowledge and observations of men, such as missionaries, administrators, and others, who were living in intimate relations with the native tribes before the advance of civilization began to obliterate all true traditions and habits of the South African natives; and that the authori-

ties should by conference establish a proper nomenclature of the various groups of natives with a view to ascertaining their inter-relationships. The resolution closed with the recommendation that opportunity should be given to administrators of native affairs, before or after their appointment, to study comparative ethnology for at least two terms in one of the universities of the United Kingdom.

The Cambridge University Extension summer meeting was opened on August 2 by Ambassador Whitelaw Reid, who gave an address on "The Rise of the United States in the Eighteenth Century, and the Tendencies of Its Development." Beginning with the statement that it was the greatest fact in modern history, he sketched the main events and their causes of that period, emphasizing the personal sense of loyalty to the mother country by quoting, from a private letter of Benjamin Franklin written in 1758, the remark that George III. was "the best monarch any nation was ever blessed with." American success was due, first to character, then to desperate earnestness, and lastly to circumstance. "The inefficient were sifted out—those left were a picked class . . . and there was an absolute freedom for individual initiative." He closed with a reference to the collectivist or socialistic tendencies of the times as threatening to destroy this freedom. He confidently believed, however, that the English-speaking races, "on whatever continent or island, would surely in the end hold fast to these ancient characteristics of a strong, free people, and so keep secure their places in the van of human progress."

A noteworthy career has been closed by the recent death of the Rev. George Grenfell, at the age of fifty-seven. He went to the Cameroons as a Baptist missionary in 1874, and four years later to the Congo Free State, which has been the scene of his labors ever since. To his missionary work he added that of an explorer, and, after Stanley, he has probably done more than any other Englishman to add to our knowledge of the river and its tributaries. "Few explorers in any part of the world," says the *London Times*, "have made such extensive and valuable contributions to geographical knowledge as this modest missionary, who, had he possessed the ambition and 'push' of men who have not done a tithe of his work, would have been loaded with honors." For some special service he received orders from the Portuguese and Belgian governments, and the Royal Geographical Society awarded him the Royal Medal. His position in regard to the Congo State scandals was shown in a letter published a few months ago in which he spoke frankly and strongly of the atrocious cruelties to which the natives were subjected.

The name of Maître Edmond Rouse is all but unknown abroad, and was but little known at home in France until his death on the first day of August, in his ninetieth year. He was the oldest member of the French Academy in age, though not in office, and he had long been dean of the Paris bar, of which he was the *bâtonnier* during the Siege and the Commune. He was the type of an ancient world which is disappearing fast; bred upon the classics, painfully writing out pleas which were

lucid, forcible literature rather than the rough-and-ready oratory of our modern courts. His election to the Academy was a tribute to law, clothing its forensic form with high literature; he was the first member of the bar to attain a seat among the Forty Immortals without ever passing through a political assembly. Before the delighted jury of Chartres, had he not bodily transformed Cicero "Pro Muræna" into his own plea for a criminal—who was acquitted? During the Commune, at the risk of his own life, he defended Gustave Chaudey against Raoul Rigault, the Latin Quarter brawler, who had been made Public Prosecutor in a parody of justice. In 1880, against Jules Ferry, and again in these last years against M. Combes, he succinctly and forcibly presented the legal rights of the religious associations which the Republic was suppressing. Renan, in the name of the French Academy, said of him: "We never see him entering our weekly meetings without saying, the good and righteous have their seat with us."

The latest news from Sven Hedin is contained in a letter to King Oscar of Sweden, who has allowed the Stockholm newspapers to print it. Much of it relates to the exploration of the desert region of Kevir, which is marked in English and Russian maps as a salt desert, but which Hedin found to be really a shallow inland sea. It rained incessantly while he traversed this region with two companions. The camels found it so difficult to get along that Hedin and his men had to walk most of the time, and repeatedly they were in danger of sticking in the malodorous, swampy ground. Subsequently, the explorer visited the Bahaba desert and then prepared for his journey through Seistan to India. He had heard reports of the ravages of the plague in Seistan, and had abundant occasion to verify them. At Nashretabad, a town of 2,500 inhabitants, nine-tenths had perished at the time of his arrival, and this was but a sample. Famine had prepared the soil for the epidemic, and the hostility of the natives to sanitary measures allowed it free sway. With his own eyes, Sven Hedin saw a mob attack a plague hospital and set it on fire. The object was to destroy the supply of serum, but this had fortunately been taken to another village.

The pamphlets and tracts of the German Reformation are growing more difficult to obtain, even for libraries of large means. The old collection of reprints by Schade is now out of print, and is also incomplete, and the selection of publications from this period in the "Neudrucke deutscher Literaturwerke des XVI. und XVII. Jahrhunderts" were, of course, selected from other points of view than that of their historical significance. The publication, under the editorship of Dr. Otto Clemen, of a series of "Flugschriften aus den ersten Jahren der Reformation" (Halle: Haupt), is therefore most welcome. Each tract will be accompanied by an historical and bibliographical introduction, and many by reproductions of the original illustrated title-pages. The first two numbers contain reprints of four small tracts, those brought together in the first number being of special popular interest, as showing the attitude of the younger generation towards Luther and the movement which he in-

stigated. One is a letter from a student in Wittenberg to his parents in Swabia; the other a dialogue between an old peasant and his son, who has just returned from the same university. Among those in preparation we find a collection of pamphlets belonging to the prehistory of the Peasants' War. The year of this upheaval, 1525, has been chosen as the time limit of the present series; as the character of the controversy changed after this, and the mass of tracts grew smaller. The series is intended to contain both Protestant and Catholic publications. The price, 9 marks, for a volume of 30 signatures, is very moderate.

The bibliography of the Reformation period in Germany, in spite of careful elaboration, still offers many difficulties. To assist in removing some of these has been the aim of Alfred Goetze in his book, "Die hochdeutschen Drucker der Reformationszeit" (Strassburg: Trübner). He presents facsimiles from 79 books by as many different printers, and gives full imprints, parts of the title-pages, and as complete alphabets as possible, besides biographical data about the printers, including details as to their religious and political affinities. Minute descriptions of 194 title borders are also given. A close study of the types and title-borders used, and of the dialect, is the surest means of identifying the many undated tracts from this period.

Dr. Konrad Haebler has written the introductory text to Paul Heitz's facsimile collection "Hundert Kalender Inkunabeln" (Stuttgart: Heitz & Muendel). From among the two hundred and more calendars printed before the year 1500, which have come to the editor's and the author's notice, they have selected for reproduction one hundred, printed on single leaves, omitting all of larger compass as well as all fragments. While the introduction is mainly confined to investigations of a typographical and astronomical character, the importance of these early popular publications for dialect studies is indicated: sixty-five of the hundred calendars are in German, the rest in Latin. Dr. Haebler is here able to prove the correctness of the late Robert Proctor's guess that the Leipzig edition of Capotius's "Oratio Metrica" and the other books in the same type were printed by Martin Landsberg. The astronomical features of the calendars run largely into astrology, though we can see clearer ideas emerge from the mist of superstition, as, for instance, when the author of the 1478 calendar (No. 23 in the present collection) suggests that one who is sick might seek a competent physician, rather than submit to be bled according to the stars.

These small productions of the first printing presses are receiving more and more attention. They are usually found in old bindings, and three such broadside calendars for the years 1492, 1493, and 1496, so discovered, are described by Dr. Isak Collijn in the last (ninth) volume of the publications of the Kungl. Humanistiska Vetenskapssamfundet in Upsala. The 1492 calendar is of particular interest to the student of printing in Sweden, as it throws light on the Lübeck printer Bartholomæus Gothan, who, in 1483, introduced the new art into the northern Kingdom. Among the other contributions in this volume the

most important is August Hahr's study of Art and Artists at the court of Magnus Gabriel de la Gardie. This great nobleman, son of Gustavus Adolphus's famous general, was one of the wealthiest men during the period following immediately upon the thirty years' war, and an earnest lover of art and science. He did much to promote the progress of both in his native land. His services as chancellor of the University of Upsala were by no means perfunctory, and among his benefactions to its library is the Codex Argenteus whose silver binding was prepared to his order. He employed a great number of artists: painters, architects, and decorators, and among their works are some of the most interesting monuments of the art of the seventeenth century, especially in architecture. Drottningholm, since one of the palaces of the royal family; Karlberg, now the seat of the military academy of the Kingdom, and particularly Leckö, on an island in Vänern, are monuments of De la Gardie's wealth and love of art, and contain many paintings executed for him. His interest in art continued even after the Reduction had brought him to poverty. Dr. Hahr's monograph is an interesting contribution to the history of civilization in Sweden while the country was a world power.

Pierre Loti's new book, "Les Désenchantées," as literature, is a watery sequel to the "Azlyadé" of his sugary-sweet prime. As a human document, it perhaps portrays as nearly as a European can the states of mind and emotions of those latest inmates of Turkish harems who have been brought up to read French novels, including Loti's own. They are probably few in number; two of them, near relatives of the Sultan, lately escaped, and had their story written up for a Paris journal. It was far from sensational, and chiefly impressive by its disclosure of family affection and frank relations with male relatives, also Europeanized young Turks. Of course, Loti, after absorbing all this and what he has found out in Constantinople, squeezes from his own emotional faculty a story more like what we think ought to be. Even so, certain English historical poems are what Robert Browning refelt and attributed to his heroes and heroines. Meanwhile, Pierre Loti's descriptive power is as great as ever; and he has just been promoted in the French navy, as Capt. Julien Viaud, to be full ship commander.

The title of Thomas Okey's "Story of Paris" (in the Dent-Macmillan Mediæval Towns Series) is rather misleading. The book consists of two very slightly related parts, the first of which is a history (not a story) of Paris, and the second a guide to that section of Paris which is enclosed by the "inner boulevards." The history is a fairly picturesque and entertaining compilation, whose sole distinctive feature is a series of running comments on the present condition of the historic sites mentioned in the narrative. The guide is a curious cross between a Baedeker and a Hare, without the satisfying definiteness of the former or the charm of the latter. For such a volume, hurried travellers will have no use, because they rub along very well without any knowledge of history and find that the line of least resistance in "doing" foreign cities is to put themselves

completely at the mercy of a human guide. The seasoned travellers will have no use for it, because they prefer to take their history from the accredited historians and to get such practical information as is indispensable for sight-seeing from a Joanne or a Baedeker, which leaves everything to the imagination and makes no pretence of providing intellectual companionship. The book is well made, as the Deut books usually are. It has a quiet cover, and can be carried in the pocket—two points of excellence which, in a guide-book, are not to be ignored.

There are few German theological treatises which are translated into English from more than one edition. Few, indeed, so richly deserve it as does Herrmann's "Verkehr des Christen mit Gött," which was translated from the second German edition in 1895, and now appears again in English dress altered and corrected from the fourth issue in German ("The Communion of the Christian with God. Described on the Basis of Luther's Statements," Putnam's). The reputation of the book as on the whole the best exposition of the Ritschlian theology, also as the leading work of one of the most distinguished German teachers of Christian doctrine, a man of singular charm and unusual personal attractiveness, justifies the pains taken to keep it before English readers. The unfortunate divisions and paragraph headings of the earlier issue are discarded, and the author's summary has been followed. In the text there is greater conciseness and clearness, objections which have been raised by critics are answered, and endeavor is made to avoid further misunderstanding. Something of the appearance of exclusiveness or narrowness which was very marked in the earlier editions has been removed. In these days of confused religious thinking and talking, when everything under the sun that has an element of truth in it is claimed as a Christian doctrine, and any kind of piety is welcomed as Christian, especially if it sound a little new and strange and have the faculty of making noise, it may be doubted whether the voice of this German teacher of distinctively Christian piety will have much of a hearing. Herrmann does not enter the lists as a champion of the religious sentiment in general, but rather as a defender of one particular faith. He does not profess to have had the religious experiences of a Mohammedan or a Confucianist, and not having had their experiences he does not undertake to expound their doctrine. In his actual environment, however, he has met with realities which have produced religious convictions of a very definite sort, and these he endeavors to make clear. His book is an exposition of the Christian way unto God, the Christian method of coming to be somewhat at home among the mysteries of the universe and becoming reconciled to its tragedies. Whether it is good ecclesiastical statesmanship to lay claim to every truth in sight as Christian truth, and to herald Darwin and Huxley as Christian prophets, as the Dean of Ely has done of late, or, on the other hand, to be content with that which is historically Christian, must be determined by those who shape Church counsels. But the interests of clarity would be served by more general adoption of the method of Professor Herr-

mann. One cannot read this essay without remarking the influence it has exerted during the last twenty years. Scores of writers and preachers of influence, in England and Scotland especially, have found here their inspiration. Few will read it without desiring to antagonize at many points. It is now too orthodox, now too radical. But few who are interested in the high theme it handles will not be kindled by it. It is a book which has entered into the life of our time, and its work has been in behalf of sincere piety and true devotion.

Frankfurt, Germany, still continues its policy of having "guest" conductors. The concerts of the coming season there will be presided over by Mottl, Mahler, Strauss, Nikisch, Steinbach, Toscanini, Mengelberg, Wolfrum, Henry Wood, and others.

Smetana's opera, "The Bartered Bride," had a festival performance at Prague recently to celebrate the fortieth anniversary of its original production there. Since that time it has been sung no less than 440 times. A work which has stood such a test surely deserves a hearing outside of Bohemia, too. The same may be said of Dvorák's opera, "Dimitrij," which has been sung so often that the scenery has had to be replaced by a new set.

Mascagni's successor at Pesaro, Amilcare Zanella, is also a composer, and like most modern writers, he belongs to the Liszt school, inasmuch as he composes symphonic poems. His "Faith" was produced at a recent concert by the Scala Orchestra in Milan, and was favorably received.

M. Messenger, the well-known French composer and operatic manager, was asked the other day in London, whether he would recommend a subventioned opera house for that city; he replied, according to the *London Truth*: "Ah, ça non, par exemple! I should know something of the State-subventioned theatres. At our Opéra Comique in Paris, we receive 300,000 francs a year from the Government. Do you know what it costs us? Not less than 247,000 francs' worth of seats, which we have to give away every year to the *gens du Gouvernement*; and I assure you, they are our best seats."

Messenger has written another opera, founded on Alfred de Musset's "Le Chandelier." It is to be produced next season at the Opéra Comique. That his operetta "Véronique," excellently produced in New York last season, was not more of a success, does not throw a favorable light on American taste in light music.

The Paris Grand Opéra has more than 1,200 persons on its regular payroll, while in addition to these there are hundreds more—painters, decorators, costumers, etc.—who draw their incomes indirectly from the same source. Hence, even the large subsidy of \$160,000 a year hardly suffices at times to make both ends meet. The highest possible receipts for a single performance are \$4,600, but that figure is rarely reached, the average being about \$3,250; and as the cost of each performance works out at about \$4,000, the necessity of a subvention is obvious. The musical staff of the opera comprises over 400 persons, including 50 soloists, 100 chorus singers, 100 orchestral players, 140 dancers, 3 orchestral conductors, 8 choral conductors,

and an army of "supers"; nor is the administration staff less numerous.

Probably Julius Stockhausen, who celebrated his eightieth birthday on July 22, feels himself still a young man in view of the fact that his teacher, Manuel Garcia, died only a few weeks ago, aged one hundred and one. Stockhausen, though a German by descent, was born in Paris and got his education at the Conservatoire. His father was a harp virtuoso, his mother a favorite singer. Manuel Garcia taught him the art of the *bel canto*, and thereby did a good thing for Germany, where that art is not over-well known. Stockhausen sang at the Opéra Comique, Paris, in the years 1859 and 1860; the rest of his career was spent in Germany, where he became famous successively as a singer, conductor, and teacher. He had a fine voice, and what distinguished him from most of his colleagues was the exemplary distinctness of his enunciation. He was an admirable interpreter of the songs of Schubert, Beethoven, and Schumann in particular; also of the works of Bach and Handel. Richard Wagner offered him the position of head of the conservatory founded by him in Munich; but he was obliged to decline this honor, as he had just signed a contract to conduct the Singacademie and the Philharmonic concerts at Hamburg. Subsequently he conducted the Stern Choral Society in Berlin, producing some notable performances. In 1874 he went to Frankfurt and thenceforth devoted himself to teaching those principles of vocal art which came from the Italian Garcia, and fulfilled the ideal of the German Wagner. His "Gesangsunterrichtsmethode," the first edition of which was published in two volumes by Peters, Leipzig, in 1881, contains the results of his experiences of a lifetime as a student and teacher of singing.

PALESTINE EXPLORATION.

Researches in Sinai. By W. M. Flinders Petrie. With chapters by C. T. Curcilly, M.A. New York: E. P. Dutton & Co. \$6 net.

Chronologically this book is as bewildering as the old Egyptian records. The preface was written at University College, London, on no date. The expedition started from Suez on the 4th of December in no year. Future historians will find the same difficulty in dating Professor Petrie's expedition to Sinai which we now find in dating Egyptian expeditions of the fourth or twelfth dynasties, where the month and the day are often well established, but chronologists differ by 1,500 years or more as to the annual figure.

This work, as we understand it, is a preliminary and more general account of the expedition, the inscriptional results of which are to be published in full by the Egyptian Research Account, under the title, "The Egyptians in Sinai," with translations, notes, comments, plates of objects, and the like. What was accomplished by this really remarkable and most interesting expedition is summed up in a general way by Professor Petrie as: (1.) Putting in order the Egyptian inscriptions previously known from the Sinaitic peninsula and fixing their places and connections. Two or three hundred inscriptions have been drawn

full size in fac-simile and many of them photographed. (2.) Determining the plan of the temple at Serabit and the restoration of the architectural details of the same. (3.) Making a topographical map of the district, with a record of the position and character of the mines. (4.) Discovering of a considerable mass of offerings. (5.) Reconstructing from the records the organization of Egyptian mining expeditions. (6.) Throwing light on the non-Egyptian ritual of the worship in Sinai (which Professor Petrie believes to have been Semitic, p. 223). We might add, although it is not mentioned by Mr. Petrie in this place, the discovery of some inscriptions in unknown characters, not hieroglyphic, and different from any characters heretofore found.

The first work of the expedition was done at the turquoise mines at Maghareh. From the outset, it would appear, copper chisels and other tools were used in working these mines. The earliest of the rock-cut inscriptions found at Maghareh is an inscription of Semerkhet, the seventh King of the first dynasty, "engraved on a smooth, natural face of the upper sandstone rock, at 394 feet above the valley floor" (p. 41). The earliest indications of the working of these mines belong, however, to a slightly later period, the time of the third dynasty; a sculpture of King Sa-nekht of that dynasty having been found over an early mine. Unfortunately, this tablet had been partly destroyed in later mining operations, but an admirable portrait of Sa-nekht is preserved, of which Mr. Petrie remarks that it is as strongly Ethiopic in character as the portrait of Shabaka of the twenty-fifth, Ethiopian, dynasty, and that it is a type familiar to-day among the Sudanese (he spells it "Sudanys") of the Egyptian army and police.

The principal work of the expedition and the most interesting was done at Serabit, of the mines in the neighborhood of which much less was known than of those at Maghareh. The point of special interest at Serabit is the temple of Hat-hor, mistress of turquoise, which was begun under Sneferu, the last king of the third dynasty. Sneferu's remarkably successful mining operations, it may be added, became a tradition of all succeeding ages, so that, for example, an official of the twelfth dynasty says, on a *stèle* which he erects, that "he had obtained more turquoise than anyone since the time of Sneferu" (p. 96). Sneferu himself became an object of veneration and worship to succeeding ages of miners, so much the more, therefore, his temple to Hat-hor. The original shrine, and the shrine as Sneferu left it, was a cave. It was in the period of the twelfth dynasty, and particularly in the reign of Amenemhat III., that this cave was developed into a temple, by the erection of a portico before it and the provision of an approach marked by a row of *steles*. A second cave was also cut out at this period or earlier, side by side with the cave of Hat-hor, and dedicated to Sopdu, the god of the East.

With the eighteenth dynasty, and especially with Queen Hatshepsut and her nephew Tahutmes III., a new development of the temple commences, which is a most curious combination of Egyptian with non-Egyptian ideas and forms. A new line of approach was constructed, along which

courts, chambers, and pylons were built, new chambers being added by successive monarchs, up to and including Sety I. In its final form the visitor was obliged to pass through fourteen chambers of various sizes (apparently roofed over, for the greater part, so as to have almost the form of a tunnel) before reaching the large open court of the temple. From this the sacred cave itself was separated by an inner court and a couple of porticoes. Although, as stated, Egyptian elements are marked in this construction, nevertheless it is clear, as Professor Petrie has pointed out, that in its origin this shrine and hence this worship were not Egyptian. Professor Petrie assumes that it represents the early Semitic worship on the ground: (1) that this region, in the historical period at least, was occupied by Semites; (2) that the immense amount of ashes over the whole space in front of the cave indicates sacrifice of a form which he supposes must be Semitic, chiefly because it is not Egyptian; (3) that small altars are found in the cave, apparently for the burning of incense, whereas the Egyptians burned incense not on altars but in shovels; (4) that there are provisions for ablation in the courts and chambers in the immediate neighborhood of the sacred cave, which he compares especially with the Moslem provision for ablation in the court or chamber called *hanafiyeh*. (In the plan of the temple he names the chambers provided for ablation *hanafiyeh* on account of this supposed similarity.) His argument is valid as showing that the temple is not Egyptian in origin and represents primarily a native, non-Egyptian cult; but he presents no real evidence that this cult was Semitic. In fact, at the date at which the worship of Hat-hor at Serabit began, the date of Sneferu's cave temple, it is now generally supposed that the Semites had not yet arrived in the land. The use of the cave as a shrine seems, it may be added, to suggest a connection with the primitive people who used caves for purposes of worship in Palestine, like those found by Macalister at Gezer, and who, as the excavations there conducted would seem to show, were not a Semitic, but a pre-Semitic population.

One chapter in this volume is entitled "The Revision of Chronology." We do not see that Mr. Petrie's discoveries in Sinai have thrown any new light on the chronological question. His discussion of the subject is really based on material previously discovered. The dates which he assigns from the 12th dynasty backward are, it should be added for the guidance of the unwary reader, about fifteen hundred years larger than those generally accepted at the present time.

It is inevitable that a traveller or explorer in Sinai should somewhere or other discuss the questions of the Exodus, and Mr. Petrie is no exception to this rule. His methods will prove startling, alike to the conservative literalist and the radical higher critic of the Old Testament. For instance, he assumes the census lists of the book of Numbers, as contained in the Masoretic text of the Hebrew Bible, to be historically accurate (p. 209); but supposes that in the case of each tribe the thousands mean merely clans or tribal divisions, the hundreds giving the actual numerical figure. By thus eliminating the thousands he reduces the Israelite tribes from a couple of million to

the reasonable figure of five or six thousand souls, which he says is about the present population of Sinai. While this is not likely to be taken seriously, it must be said that Prof. Petrie's little sketch of the history of Israel from a cultivated Egyptian's point of view, on pp. 221-222, is a very good condensed presentation of the subject.

The volume is admirably executed, with heavy paper and large, clear type, and is also abundantly illustrated. There are 186 half-tone prints from photographs and four maps. By means of the illustrations, in connection with the text, one obtains an admirable view of the rock formation of Sinai, the character of the country, the vegetation, the appearance of the ruins, the objects found, etc. Perhaps the most interesting of all the illustrations is the head of the statue of Queen Thyi, the famous wife of Amenhotep III. of the eighteenth dynasty. This is, as Mr. Petrie points out, the best portrait head of this most interesting woman so far discovered, and it presents a fascinating personality.

Mr. Petrie found that a vandal mining company, organized some time since for the exploitation of the ancient turquoise mines, had destroyed in the most wanton and reckless manner, by blasting, numbers of the inscriptions cut in the rock and of the *steles*. They had also taught the natives how to blast, and it seemed likely that before many years absolutely none of these ancient ruins would remain intact. On Mr. Petrie's representations, his associate, Mr. Currelly, was commissioned by the Egyptian Government to cut out all the rock inscriptions which were accessible, and these pieces have now been transferred to the museum at Cairo as the only means of preserving them. In some chapters added to this volume Mr. Currelly gives an account of the supplementary expedition to Sinai which he undertook for the purpose of removing these inscriptions.

AN OLD-FASHIONED SINGING TEACHER

Observations on the Florid Song. By Pier. Francesco Tosi. Imported by Chas. Scribner's Sons, New York. \$1.75 net.

Alas for the good old times in music, the golden age of song! Things have come to a pretty pass, indeed, when one of the leading vocal teachers is constrained to tell us that "the good taste is near lost, and the profession is going to ruin"; that some vocalists "scream like a hen when she is laying her egg"; that the singers, particularly the Italians, neglect true study, sacrifice beauty of voice to a number of ill-regulated volubilities, and neglect the pronunciation and expression of words; that, as for the recitative, some overdo it and make it barking, some speak it and some hiss it, some hallow, bellow, and sing it out of tune; that there is a scarcity of the best singers and a swarm of the worst; that persons "who never sang nor knew how to sing pretend not only to teach but to perfect, and find some that are weak enough to be imposed on"; that the churchmen usually choose not the best but the biggest voices; and finally:

Italy hears no more such exquisite Voices as in Times past, particularly among the Women, and to the Shame of the Guilty

I'll tell the Reason: The Ignorance of Parents does not let them perceive the Badness of the Voice of their children, as their Necessity makes them believe, that to sing and grow rich is one and the same Thing, and to learn *Musick*, it is enough to have a pretty Face: "Can you make anything of her?"

A sad arraignment, forsooth! The one consolation is that it was written in the year 1723, in that very golden age of the *bel canto*, with which modern ignoramus and charlatans are continually and lugubriously contrasting our own age! The strictures on Italian singers, teachers, and pupils summarized in the preceding paragraph may be found, at greater length, on pp. xi. 15, 63, 141, 159, 166, of Tosi's "Observations on the Florid Song." Pler Francesco Tosi, who was born in 1647 at Bologna, was for a time a singer, and subsequently went to London where he became one of the most famous teachers of his time. His treatise, "Opinioni de' cantori antichi e moderni o sieno osservazioni sopra il canto figurato," was translated by Gilliard into English in 1742; a German version followed in 1759; a French, in 1874. It was a happy thought on the part of William Reeves of London to bring out a reprint of the second edition, as the book is a clear mirror of the musical world of the time. Tosi had spent much of his life in travelling, and he was therefore familiar with the vocal situation in the leading European countries. The object of his book is, in his own words, in the first place, "to shew the Duty of a Master, how to instruct a Beginner well; secondly, what is required of the Scholar; and, lastly, with more mature Reflections, to point out the way to a moderate Singer, by which he may arrive at greater Perfection."

It is to be feared that if a "moderate singer" of our time were to try to attain "perfection" by taking this book as a guide, he would not get very far toward mastering the vocal styles now in vogue—the styles of Verdi, Puccini, Gounod, Bizet, and Wagner. To Tosi, as to his contemporaries, the chief charm of singing lay in the abundant ornaments with which all the airs were then decked out, and which the modern composers of all countries have entirely discarded. Chapter X. begins with the admonition that "passages or graces being the principal Ornaments in Singing, and the most favorite Delight of the Judicious, it is proper that the Singer be very attentive to learn this Art." He admits that there may be too great an abundance of ornaments, yet considers that better than a deficiency; wherein, again, he is a child of his time. He devotes chapters to the various kinds of shakes and "graces." He waxes indignant at his countrymen for allowing the impudent "Composers in the new Stile" to write their own ornaments instead of leaving them to the discretion of the singers. "Poor Italy!" he exclaims; "pray tell me; do not singers nowadays know where the *Appoggiatura's* are to be made, unless they are pointed at with a Finger? . . . Eternal Shame to him who first introduced these foreign Puerilities into our Nation. . . . Let us imitate the Foreigners in those Things only, wherein they excel." On another page he says: "If, out of particular Indulgence to the sex, so many female Singers have the Graces set down in Writing, one that studies to be-

come a good Singer should not follow the Example."

While thus the bulk of Tosi's volume has merely an historic interest, there is nevertheless a good deal that is of value even to present-day students. Despite his preference for the florid side of singing, our author knows the difference between mere virtuosity and true art. He understands that every instrument has graces peculiar to itself, and that it is a great mistake for singers to copy the tricks practised on violins, oboes, or other instruments. He realizes the truth of what Mozart once wrote to his father: "It is much easier to play rapidly than slowly; you can drop a few notes in passages without any one noticing it." Tosi, whose book appeared thirty-three years before Mozart was born, blames the singers of his time for praising the "Pathetick," or slow music, yet singing the Allegro. "He must want common sense that does not see through them. They know the first to be the most Excellent, but they lay it aside, Knowing it to be the most difficult."

About this neglect of the Pathetick and Expression in music in his times (the good old times!) Tosi is perpetually wailing. The singers, he declares, are always "running Post," always galloping with the airs; the much-longed-for adagio never comes, and why not? Because "the grand *Mode*" demands of the singer "that he be quick, and ready to burst himself in his lamentations, and weep with Liveliness"—which reads almost like Wagner or Donizetti! Gluck, too, is anticipated by Tosi, who represents the intolerable presumption of those singers who expect a whole orchestra to stop for their ill-grounded caprices, that tickle the ears of the groundlings.

Scattered through Tosi's pages are a number of rules for singers and aphorisms which bear further witness to his common sense and his good taste in everything excepting his penchant for ornaments. To cite a few: he advises singers not always to practise on one vowel; to guard against "fluttering" of the voice; not to hold the music paper before the face in singing; to sing standing; to study with the mind when the voice is tired; to neglect no opportunity to hear great vocalists; to sing before a mirror; to continue their studies as much to maintain their reputation as they did to acquire it. "Whoever does not aspire to the first Rank, begins already to give up the second, and by little and little will rest contented with the lowest." "One who thinks on nothing but Gain, is in the ready way to remain ignorant." He finds a use for the critics: "for, the more intent they are to discover Defects, the greater Benefit may be receiv'd from them without any Obligation." Most singers will agree with him that it is well often to change cities lest they get too good an opinion of themselves; but how about his advice that "the best Time for Study is with the rising of the Sun"? And will theatre folk agree with his assertion that it is "much more difficult to sing well than to act well"? On that subject it would be interesting to collate the opinions of great opera singers, the only ones qualified to speak authoritatively.

The History of Coöperation. By George Jacob Holyoake. 2 vols. New York: D. Appleton & Co. \$5 net.

Coöperation has been sidetracked. Capitalism and militant trades unionism have the field to themselves, and treat as armed antagonists, not as allies. The latest edition of Mr. Holyoake's well-known history of the coöperative movement is therefore the history of a lost cause—a verdict attested by the slender sheaf of pages which recounts its progress since 1876. Except for these few pages (615-678) which constitute Part III. of the second volume, the present edition is practically a reprint. It is rather curious that the original chapter on "American Societies" has been pared down a little, and that the only new item is a comment of four lines upon the profit-sharing ventures of N. O. Nelson.

But if coöperation is a lost cause, it has at least had the good fortune to have its definitive history written by one of its own patriarchs. Indeed, his interest in the cause was widely commented on at the time of his death. Had it not been for Mr. Holyoake, many of the most interesting phases of its early progress would, in all probability, have fallen into oblivion. At its inception it had a broader impulse than most would imagine to-day. Coöperators were at the outset inspired by Robert Owen's achievements, and also somewhat nebulously by his social philosophy. This was enough to bring them under the suspicion, censure, and actual persecution of the intolerant, particularly of the clergy. In a way the early coöperative movement was a crusade for the right of free speech and a free platform. Coöperators were often forced into an alliance with various types of anti-clericals—an alliance explained by their confronting a common enemy. These "small centres of social life," as Holyoake calls the coöperative nuclei, believed themselves in possession of a secret that was to transform society, and on a small scale were inebriated with an optimism like that of the early French Revolution. Thus something of the bracing stimulus of founding a new sect and spreading a new gospel attached to the early spread of the movement.

But the success of Robert Owen's industrial paternalism, as our author admits, would eventually have stood an isolated monument of a successful coöperative organization, "if the sagacious men of Rochdale had not discovered the method of feeding it on profits" (vol. I., p. 264). But while coöperative shop-keeping kept coöperation alive, it was not calculated to sustain the lofty idealism of the early propaganda. Instead of renovating society, coöperation found its homely task in enabling an occasional family of uncommon thrift to save a half-penny daily in buying soap and candles. This is not much, viewed from one point of view. It is far from allaying forever the clash of opposed industrial interests. But it is something, and apparently something permanent.

The economic historian, when he makes his final estimate of coöperation, will have to explain why the general project of reconciling employers and workmen was so warmly received by statesmen, and economists, and why so few of the hopes raised by the system have been realized. John Stuart Mill, it will be remembered,

bestowed his benediction on coöperation, and Lord Derby pronounced it the "best, the surest remedy for that antagonism of labor and capital" which has so long vexed students of society. The secret of Mill's adherence lay probably in the fact that coöperation made an appeal not only to altruistic motives, but also to self-interest. Its alluring paradox was that by consulting our neighbor's economic interests, we were most likely to further our own. It seemed to make the quest of industrial virtue easy, by intimating that happiness was the invariable attendant. Thus the miracle of transmuting leaden motives into golden conduct was to be attained.

The failure of coöperation to secure and guarantee industrial peace has often been well elucidated, but by no one more penetratingly than by Holyoake. He admits and bewails the fact that "the working class are apt to fix all salaries at the workshop rate, and begrudge every sixpence over that." . . . "For a man's brains, devotion, interest, and experience they award nothing willingly" (vol. ii., p. 340). It would appear also that "false brethren" have entered even into the coöperative fold. "The table opposite, of 29 of the chief [coöperative] stores, shows that 21 do not understand that participation [of profits with employees] is a cardinal principle of coöperation" (vol. ii., p. 634).

Apparently, there has been of late difficulty experienced in keeping the simon-pure article free of trades-unionism and Socialism. Holyoake will have none of either. "A man being a unionist is small guarantee to any one that he will not scamp his work or do the least for the most he can get" (vol. ii., p. 435). As to Socialism, Holyoake insists that conceivably "Socialism may be better than Coöperation, but it is not the same." Self-help and individual effort are essential to orthodox coöperation. "Coöperation may mitigate reckless competition, but it does not destroy competition itself" (vol. ii., p. 674).

Holyoake is not unaware that the tide is running strongly against him, but he has experienced enough of the world's buffets to preserve a philosophic temper, and to write the history of his cause without losing his sense of humor. In recounting the early propaganda, he slyly hints at his personal disrelish for some of the lean platform prophetesses, "learned in all the 'ologies and destitute of hips." He records for us with admirable philosophy that "obesity has weight in more senses than one. A fat look is imposing. . . . An attenuated visage always seems illogical to the multitude, while a mellow voice rolls over an audience like a conclusive sequence." Of the many early propagandist organs, he remarks: "It comes to pass that journals written by charity come to be read only by charity." And again he says, half prophetically, it may be, of his own pet scheme of social salvation, "Only theorists talk of truth being immortal. I have seen it put to death many times." With so genial an historian, no one will willingly quarrel.

The Maker of Modern Mexico: Porfirio Diaz. By Mrs. Alec-Tweedie. New York: John Lane Co. \$5.00 net.

Mrs. Alec-Tweedie has, no doubt, en-

joyed exceptionally good introduction to the official society of Mexico, and has thus seen more of the quiet and exclusive social circles of that capital than is given to most foreign residents. On this side of Mexican life (which touches not at all the life of the great mass of the people), she is qualified to write entertainingly; and some of her verbal snapshots of travel in the country are of interest—though one often has to lament the "perfectly lovely" style of description and other perversions of the English language. But she is not at all qualified in the history of the country; she is entirely outside of her proper field when it come to things economic and political, and no reader should pick up this book who desires a logical, intelligent account of the development of Mexico in the past quarter-century. He will run into descriptions of the costumes worn by the diplomatic corps just when he is expecting to learn how, in 1904, Diaz re-elected himself and nominated a vice-president to be in training as his successor. Instead of any clear presentation of the reactionism which the Mexican leaders of "the Reform" sought to extirpate, he will find the situation thus summed up: "The whole country was devout and the priestly power immense." To be told, with endless repetitions, that Diaz "rebuilt" Mexico gives us no explanation of his actual achievements, while sadly exaggerating his part. It is neither a real Mexico nor a real Diaz which is set before us.

As for Diaz, she is not content with describing him as the only man in Mexico, one who made that nation "out of chaos, alone and unaided." Our woman traveller's hero—who talked with her just as though he were an ordinary mortal—must be "the most marvelous man of the age," and "the greatest figure of modern history." She admits that "of course, there were other great men in the nineteenth century, men such as Bismarck, or, of humbler origin, Garibaldi, or Abraham Lincoln," but "none of them retained the head of affairs of state for well-nigh thirty years." This sort of adulation of Diaz, for which there is some excuse in Mexico, has been made the fashion in our English speaking countries by whilom journalists and makers of journalistic books who spend a few weeks or a few months in Mexico, speak and read little or no Spanish, and hear only such Mexican opinion on political affairs as is expressed conventionally or through the subsidized press (both in Spanish and English) of the capital. It has become part of the creed of American editors, apparently, that Diaz has achieved the regeneration of Mexico unaided, and that he is the model of a perfect ruler presiding over a most efficient government. Another prevalent American idea is that Mexico is in danger of revolution at any time.

Now, these two ideas are incompatible, and, as we might expect, neither is true, at least in the accepted form. Mexico is far from being in all ways efficiently governed, in some respects is not always intelligently governed, and its local administration is by no means free from corruption and jobbery; while the central administration is certainly susceptible to "influence." And, though very great progress has been achieved during the Diaz régime,

Diaz himself is by no means entitled to all the credit. The one great thing he is primarily responsible for—he, the rough-and-ready soldier—is the bringing of order out of disorder. Upon that has the structure been built. Order restored, railroads could be built, agriculture and mining were fostered, and modern industrial enterprises for the first time began to spring up. These things—indeed, the railroads and the telegraph alone—have made "pronouncements" and "plans", and all the old formula of revolutions, impossible in practice. At the same time, the modern development has turned the people away from all such movements; all the new internal property interests, besides the foreign capital invested, would be sternly set against political revolution.

On the other hand, instead of the journalistic tradition about Diaz as the perfect ruler, it is time we heard something, about the real social and intellectual progress that is taking place in Mexico, largely apart from governmental circles or governmental activity. We need to be told, that is, of the new middle class, steadily, if slowly, growing up as a result of the new industrial opportunities, bearing with it the hope of the Mexico of to-morrow—and also, be it said, growing more and more dissatisfied with Diaz in his old age. These men will not be heard through the columns of a throttled or subsidized national press; they form no part, as a rule, of the little bands of sycophantic officeholders in each state capital; they are not tied to the past by the possession of landed property and its privileges (a sanctity the Diaz régime has not yet dared invade by just taxation measures), nor by subservience to a generally ignorant and reactionary clergy, to whose wishes Diaz is each year yielding a little more easily.

The French Blood in America. By Lucian J. Fosdick. New York: The Revell Co. \$2 net.

This is a book which can be neither praised nor condemned without considerable reservations. From the bare title one might reasonably infer that the names of Hébert and D'Iberville, of Papineau and Lafontaine, would figure in Mr. Fosdick's narrative. But as a matter of fact they do not appear at all. "America" is here used in its political rather than in its geographical sense, and the French whose fortunes furnish the volume with its theme are the Huguenots. Thus the *seigneurs* and *habitants* of Canada, doomed as they are to the superstitions and ignorance of Catholicism, remain outside the charmed circle of Mr. Fosdick's panegyric. This circle, however, is wide enough to include Joan of Arc, with a whole chapter on whom the volume opens. Hallowed officially by the Roman Church, the Maid of Orleans might seem to stand rather remote from the Huguenots in both time and temperament. After portraying her as an incarnation of "the French spirit," Mr. Fosdick observes: "It is in view of all the facts that Joan of Arc is called a genuine Protestant martyr, although the term Protestant had not then come into use." We cannot stop to argue the point, but simply cite this sentence for the sake of disclosing our au-

thor's frame of mind. One who can see a Protestant in Joan of Arc would seem not to be well informed about her type of faith as witnessed by the evidence she gave at Rouen, or else to be beset by strong prepossessions.

We have said that the present work cannot receive unqualified praise. To be more explicit, Mr. Fosdick appears to have no sense whatever of historical objectivity. We would avoid stating that the historian must maintain the tone of the dictionary, but even where he has strong convictions, he will do well to discard the obsolete tactics of passing over all the facts which an opponent would array. Mr. Fosdick writes about the Roman Church in the tone of George Borrow or of the late Father Chiniquy. This may be all very well in its place, but the candid critic must point out that unstinted praise of the Huguenots and equally unstinted condemnation of the Romanists will not pass muster for an adequate account of the later Valois period. As for general historical judgments, we may quote the following dictum of Mr. Fosdick: "The French Revolution was the ultimate result of the Roman Catholic effort to crush out Protestantism in France." The same disposition to dogmatize pervades the passage in which Mr. Fosdick ascribes to the Huguenots such radical differences as mark off the New Englander from the Englishman. But did not much larger numbers of Huguenots settle in England than in New England?

Apart from its anxiety to prove too much this book is a useful recapitulation of what has been accomplished in the United States by people of French Protestant origin. The Bowdoins, Reveres, Faneuils, Bayards, Le Contes, and Danas are not to be passed over in any sketch of American ethnology, and Mr. Fosdick has laid full stress upon their merits. Aside from a certain note of exaggeration, especially where there is a chance to laud "the Protestantism of the Protestant religion," we have little to find fault with. Mr. Fosdick brings together much interesting information about the chief Huguenot families in America, and presents it clearly.

Panama: The Isthmus and the Canal. By C. H. Forbes-Lindsay. Philadelphia: The John C. Winston Co. \$1.00.

There is need for a good book on Panama just now when the type of the canal has been decided upon and work has begun in earnest, but Mr. Forbes-Lindsay does not quite fill the want. His book appears to have been mostly written last autumn, since when a great deal of water has passed under the Chagres bridge. Attempts have been made here and there to bring it up-to-date, but the effect is to make the work incoherent. For example, on page

199 he says: "At the present time it is impossible to tell what may be the outcome of the report of the advisory board," and "it is probable that the President will formally submit the report of the board to Congress." Then on the next page the tense is mysteriously changed from future to past; he tells us when the report was submitted, and what was done with it, and proceeds to discuss its contents at length. This discussion of the relative advantages of the sea-level *versus* the lock canal is now happily of historic value only, since Congress has chosen the latter type of canal, and we hope we shall have a chance within the next ten years or so of finding out whether Mr. Forbes-Lindsay is right in his earnest advocacy of this same type. The question has been argued by engineers of all countries for over thirty years without coming any nearer to an agreement.

Mr. Forbes-Lindsay has done a service in bringing together in one small volume a large amount of material hitherto scattered through the American public documents and French company reports. He begins with the romantic history of the Isthmus when the city of Panama was one of the richest and most luxurious cities of the New World, being the channel through which flowed the tribute to the King of Spain from his empire on the Pacific. Its wealth and strategic position made it the centre of the strife between Spain and England for the supremacy of the seas, and the Isthmus was raided by privateers and buccaneers, until finally, in 1671, the old city of Panama was sacked and burned by Morgan, and the new city built and fortified on its present site.

The book also gives some interesting figures in regard to the operations of the De Lesseps Company and traces the history of the canal under the receivership, the New Canal Company, and the present commission. An appendix contains an abstract of the Government report on the great canals of the world. There is a good map and profile of the canal as authorized by Congress, and a number of half-tones of Panama scenes.

The text is constructed by compilation and quotation. The author takes his data wherever he finds them without attempting to criticize or harmonize. He glosses over the bungling and mismanagement of the first year of our control and accepts in general the statements of the official apologists of the Administration. Such an unqualified and indiscriminating eulogy as the following is of no value for an understanding of the real situation:

The commission has observed strict business principles in all these purchases. . . . There have been mistakes, of course, but no blunders. Errors in judgment and miscalculations have been quickly recognized

and rectified. Not a justifiable suspicion of graft has been connected with the operation since it came into American hands. Influence and favoritism have been singularly absent from the appointments.

Mr. Forbes-Lindsay has visited the Isthmus, but there is nothing in his book to indicate a first hand acquaintance with the scenes and events he describes. It could just as well have been written from Washington. We are glad to see that he uses the adjective "Panamanian," in accordance with the constitution of the country, instead of the unwarranted "Panamanian" to which President Roosevelt has given the weight of his authority.

BOOKS OF THE WEEK.

- Anglo-Russian Literary Society. Proceedings. May, June and July, 1906. Printed for the Society.

THE PRINCIPLES OF ELECTRIC WAVE TELEGRAPHY

By J. A. FLEMING, M.A., D.Sc., F.R.S., Professor of Electrical Engineering in University College of the University of London, Member and Past Vice-President of the Institution of Electrical Engineers of London, Member and Vice-President of the Physical Society of London, Member of the Royal Institution of Great Britain, etc. With 402 Illustrations. 8vo, \$6.60 net.

LONGMANS, GREEN, & CO., New York

The Nation.

NEW YORK, THURSDAY, AUGUST 30, 1906.

The Week.

On the question of intervention in Cuba, it is gratifying to note that the attitude of President Roosevelt has thus far been absolutely correct. He has given no encouragement whatever to the eager meddlers. And in this the better part of the press is of his mind. Here and there one meets a bit of the old swagger—"Oh, yes, we'll have to take hold of that Cuban mess, and if we go to the island again we'll never come away"—but sensible newspapers hold a different tone. They feel, as we doubt not the President does, that the honor of this country is pledged to give the Cubans a fair trial in self-government. After boasting of our unexampled magnanimity in taking our hands off, we should put them on again only under high necessity. What may be called the business temptation, we are sure that Mr. Roosevelt will put aside. He is not likely to surrender the pride which he has taken in the action of our country in giving Cuba her independence, merely to render it easier for certain interests to make money. The seductive appeal to him would be on the score of "preventing chaos." Let the American investors in Cuban tobacco and sugar get up a fair semblance of chaos on the island, and the ruler who feels himself ordained to be the policeman of this hemisphere would be sorely tempted to draw his night-club. But we hope he will not forget that the Cuban notion of chaos is very different from that of his well-regulated mind. Armed insurrection may seem to the Cubans only what a party split does to Americans. If, after all the disturbance, a strong and orderly Government emerges, it is all we have a right to ask.

President Roosevelt no doubt was unprepared for the universal ridicule now beating upon him like an Atlantic surf for his spelling-reform ukase. Aside from the personal aspect of the matter, it is not exactly a cheering thought for American citizens that the Chief Magistrate of the United States should be regarded in civilized nations as a meddler in what does not concern him. There is a feeling that he should not have dragged his office into what was for him only a personal vagary. If he had simply chosen, as Theodore Roosevelt, to join the band of heroic spelling reformers, there could have been no objection. Even if he had instructed his secretaries to spell his official correspondence so as to please Brander Matthews, he might have excited smiles, but not ridicule

and strong opposition. His order to the Government Printing Office is resented as an attempt to impose his private fancy upon the public practice. And the result may be most unhappy. President Roosevelt's successor will be likely to revoke the order. Then there would be two years' output of messages and Government documents, standing apart in the public archives in their queer literary dress. As we said when the lists of new spellings were first published, some of the forms recommended are already in good usage; a few others may fight their way to recognition after a generation or two; while the stranger and more offensive spellings can advance only over the dead bodies of those who will resist while they have breath forms that surprise and irritate, with no real compensating good, and who are accustomed to think of language as a fine art.

The American voter certainly needs to be a skilled metaphysician, if he is to keep up with the intricacies and fine distinctions of contemporary tariff doctrine. Here is the Nebraska Republican platform declaring, for example: "While yielding nothing from our adherence to this principle [protection], we believe that changes in schedules should follow changes in conditions." But is the "Nebraska idea" more or less liberal than the "Iowa idea," or the "North Dakota idea"? Only the wise men of the party know. But this is certain: The Nebraskans would never have said anything about changes in schedules being made to "follow changes in conditions" if they had read the speech of the Hon. James T. McCleary of Minnesota, delivered on June 25, and just now published in a much-belated issue of the *Congressional Record*. Mr. McCleary has taken the greatest pains to explain that conditions are made by tariff schedules, and practically nothing else. Thus, "revision downward" in 1857 brought "hard times"; "partial revision downward" in 1883 brought "partial hard times," while "revision upward" in 1897 brought "prosperity." It is absolutely plain, absolutely simple, absolutely satisfying—to any one who has not made himself mad by too much study of our economic history. But the apostle of still higher duties would almost be justified in giving up in disgust when he sees his logic wasted on a community that continues talking about "conditions," as if they were something that went on of themselves and changed spontaneously, instead of being mere tariff by-products.

After the campaign which has been

waged in Georgia upon almost every imaginable issue and personality, it would be folly to ascribe Hoke Smith's victory in last week's primary to any one cause. Smith was regarded as the representative of the extreme form of anti-negro suffrage doctrine, yet it was hard for an outsider to see where his policy was fundamentally different from those of the other candidates. A more definite issue was that of the opposition to corporation privilege. The same feeling of discontent which has made itself felt in Wisconsin, New Jersey, New Hampshire, and other States contributed to the opposition against Clark Howell, who was regarded as the "railroad candidate." It was in Georgia that the State Supreme Court, two or three years ago, made the remarkable decision that the railroads, in effect, had the right to charge freight rates high enough to pay dividends on their whole system out of their profits in Georgia alone. Of course, State regulation became farcical under such a principle. Whether this particular incident figured in the late campaign, we do not know, but it is the sort of thing which would naturally disgust the people of any community with a governing ring over-favorable to the already over-protected corporations.

We have already remarked on the exceptionally favorable promise of this year's harvests, and their good effect on our financial situation. But it has also been pointed out by all conservative critics that this benefit might be jeopardized by recklessness in the money market. This summer's great harvests will of themselves call into life, on an unusual scale, legitimate trade activity; demands of this trade on the country's capital will be proportionately large. Yet, as every one knows, the money market enters the autumn season with its available reserves of capital already under a heavy strain. At the opening of the year, Wall Street's money rate was the highest and its bank surplus the lowest in twenty-six years; and the April deficit in reserves was the first that had happened in the spring-time since 1884. More to the point is the movement of bank reserves and money rates this month. Two weeks ago the New York bank surplus fell to very much the lowest figure reached at this time of year since 1893—a figure, indeed, never touched in the summer months of any previous year without severe money stringency following. This week the rate for Wall Street demand loans has risen to 6 per cent., a price attained at this time of year only twice in fifteen years—in 1902 and 1893, both of them years of great derangement of capital.

It would not be wholly correct to say that this rate for money is a sure sign of danger. But unquestionably it gives plain warning as to what can and what cannot be safely done by our high financiers. Last week's Union Pacific dividend episode was only one illustration of the extent to which people in posts of high financial responsibility have lost their balance. Whether it be that rich capitalists are "loaded up" with securities thus far unsalable, for which they hope now to get a market, or whether they have merely gone wild, as they did in 1901, over our amazing prosperity, the perils involved in their antics on the Stock Exchange are equally manifest. What Wall Street calls the "outside public" seems, from the course of events since Union Pacific's dividend increase, to be in a mood for speculation. But it has also been made rather plain that it means to speculate with borrowed money. It is highly fortunate that the outburst of crazy stock speculation, encouraged by Mr. Harriman's exploit, has been held in check since this week's rise in money. For ourselves, we imagine that it is not so much the "public," or even the habitual operators of the Stock Exchange, who need to be restrained, as it is the gamblers in what we euphemistically call high finance. To suppose that this class of people, merely by virtue of their exalted position and opportunity, know when to start and when to stop and when they have gone too far, is unfortunately in the teeth of the monetary history of the world. Their conspicuous genius seems ordinarily to lie in shifting the penalty for their own excesses to other shoulders.

By unanimous vote of the Rio congress, the Drago plan is approved and referred to the Hague Tribunal. The South American delegates have very wisely disavowed authority in the premises. Naturally, the resolve of a debtor that he be no longer pursued harshly carries less weight than a self-sacrificing ordinance on the part of a creditor. We shall know better about the acceptability of the Drago doctrine when it has been passed on by representatives of nations holding South American Government bonds. On the other hand, the view that force may not be used against nations to collect individual debts is consonant with recent tendencies in international law and with common sense. Private debtors have gradually been released from immemorial constraints and disabilities, and we believe the time will come when to go to war because a group of speculators have invested unfortunately in admittedly bad securities will seem simply absurd. If the rule of *caveat emptor* applies anywhere, it certainly does to the paper of the Latin republics. Investors in such

securities act with their eyes open, and the price they pay fairly represents the hazard they take. One can hardly doubt that the jurists constituting the Hague Tribunal will in some fashion adopt the Drago plan. It is preposterous that an individual should be able to invoke against a sovereign State a more summary method of collection than the law permits in the case of a bad debtor in the next street.

An officer of the Smithsonian Institution, being interviewed on the question of its plans for an art gallery, gave the welcome assurance that "a patent-office exhibit of art" would be avoided. He also observed that there would be some difficulty in getting the proper pictures, sculptures, etc. Since all the available income of the Institution is already pledged to useful and growing activities, it is clear enough that an art gallery cannot be maintained from the present endowments. Gifts, though undoubtedly many will be offered, will afford at best an uncertain and unsystematic method of acquisition. In sixty years, for example, the Institution has received one important print collection, the small one of the late Harriet Lane Johnston, and a few straggling bequests. The new building for the National Museum may or may not contain proper room for a growing art museum; in any case, the Smithsonian must depend upon private beneficence, or Congress, for the support and increase of its department of art. We regard the latter resource as the proper one, and the friends of a national gallery at Washington should, we believe, devote themselves to framing a scheme that will be acceptable to Congress.

Such a plan may be found, we are confident, in the foundation of a gallery of American art, retrospective and contemporary. The fitness of such an exhibition at Washington needs no labored pleading. The mere immunity from influences of the schools and artist cliques that a Washington director may enjoy, would be a signal advantage. Moreover, the expense of the enterprise would be inconsiderable when compared with that of a general museum. There would be no need of a large, costly staff, and, considering the advantages of representation at the capital, contemporary works of art could be bought at favorable prices. A really choice collection of the best of American art at Washington would, we believe, have a wide-reaching effect upon the taste of the country at large. Once started, gifts would flow in to such an "American Luxembourg," though the tactful rejection of the mediocre would call for much adroitness in the director. An indispensable feature of the foundation would be a considerable appropria-

tion to start the gallery of older American art. The better pieces of the early schools are going up, and every dollar granted now will do the work of two or three at a later time. Presumably, the Smithsonian Institution has ascertained its powers as an art gallery by a recent judicial decision, in full consciousness of the responsibilities involved. We look to see the regents undertake a positive programme; and we submit that the plan sketched above is better fitted to win the good will of Congress and the people than any more elaborate and costly scheme for a general museum of art.

The Americanization of Europe has reached the stage of train robbery. Details of the hold-up of the train from Warsaw to Vienna show that the model may be even improved upon. One of the passengers stopped the train with the automatic brake. Three men armed with revolvers promptly jumped upon the locomotive and commanded the engineer to uncouple the mail car and take it a short distance from the train. There it was surrounded by thirty other armed men, and the cash was demanded—16,000 rubles from Alexandrewo, 15,000 from Lowicz, and so on. The bandits knew exactly what there was, and secured 200,000 rubles. In the meantime armed men were parading up and down the other cars exhorting the passengers to keep their seats and telling them no one would be harmed. To prevent an accident, the courteous highwaymen had in the meantime sent a telegram to Warsaw saying that train No. 12 was stalled and must be guarded from collision. A second robbery was a more serious affair. A custom-house official was travelling, in a third-class car, escorted by two attendants and four border policemen. He had with him nearly 50,000 rubles. Suddenly a passenger got up, drew a revolver, and shot one of the policemen dead. Six other men at that moment entered the car. A *mêlée* followed in which about 150 shots were fired. Among those killed were two generals, who happened to be in the adjoining car and who promptly took part in the fight. The thieves also lost a few men, but got away with the money.

Dr. Carl Peters, the former German explorer and colonial official, is the latest African observer to become convinced that an Africa-for-the-Africans movement has started. There is, he believes, danger of a Kaffir rising in every colony on that continent, and a general rebellion is only a matter of time. In order to meet this danger, the English and Boers are, Dr. Peters declares, drawing closer and closer together, and a general European war is all that is needed to "set off the Afri-

can powder-magazine." This may all be true; but it ought to be added that if the natives wanted an excuse for such an uprising against the white man's domination, it would be found in the cruelties Dr. Peters practised and the wrongs he inflicted while in the German colonial service, for which offences he was forced to retire to private life. But in England this is forgotten. For the moment, Dr. Peters's testimony is cited as proof that Sir Edward Grey was correct in his first position that the House of Commons must not criticise the English administration in Egypt, unless it wished to see rebellion in that country. From that stand, it should be noted, the Foreign Secretary has now rather ingloriously receded, there being absolutely nothing to connect the murder at Denshawi with any political movement. Surely, the way to stimulate the Africans to oppose European influence is to show just such nervousness as betrayed Sir Edward Grey in this case.

The proper attitude of the other German parties towards the Social-Democrats gives rise to never-ending discussions, which have been intensified of late by renewed Social-Democratic successes. The Emperor and the reactionaries urge the banding together of all the voters in a league to defeat the party of Bebel. This, in their opinion, is a patriotic duty. It requires some courage, therefore, for a radical Liberal like Dr. Barth to urge rather an alliance with the Social-Democrats. Himself an individualist, and in no sense a believer in Socialism, he finds himself compelled to this step by the steadily growing power in the Empire of the clerical and agricultural influences. The schools in Prussia have just been handed over to the church, there are millions upon millions of dollars to be spent upon canals at the behest of the great landlords, there is a total absence of any desire to uplift the masses of the people, and the selfish protection interests are more and more menacing. When the radical Liberals have aided the National-Liberals or the Centre in electing members of the Reichstag, these parties have simply accepted the favor and gone on without the slightest regard for the wishes of those, like Dr. Barth, who turned the scales in their favor. To the Social-Democrats Dr. Barth now makes overtures, despite their policy of isolation, for with all its defects it is the one party which, by correct or mistaken methods, seeks earnestly to right intolerable social conditions. Should the radical Liberals follow Dr. Barth's advice, the Social-Democratic wing of the Reichstag ought to make considerable gains in certain portions of Prussia.

"While we weep over the means, we must pray for the end," wrote Jeffer-

son, speaking of the unfortunate fact that the efforts of mankind to "secure the freedom of which they have been deprived should be accompanied with violence, and even with crime." The words rise to the lips as one reads of the latest political murders in St. Petersburg. In Russia, the bomb is now the inevitable response to martial law, the censorship, the dissolution of the Duma, the suppression of free speech. With every other vent for the people's will closed, outrage and assassination become press and orator in one. With the muzzling of newspapers, with no debate, no explanation, no possibility of remonstrance, how can we wonder if, as Wendell Phillips said in 1881, resort is had to "the last weapon of victims choked and manacled beyond all other resistance"? "God means that unjust power shall be insecure." The effect of the attempt to kill Premier Stolypin, attended by such horrors as the dispatches have told us, may lead the Russian autocrats to new and fiercer acts of repression. But the lesson they should learn is the need of hastening the lawful and free and recognized expression of the hopes and demands of the Russian people by means of an unfettered press and local and national assemblies. Through them, no doubt, the Czar would be exposed to many explosions of eloquence, but that is better than bursting bombs. And it may be set down as certain that, hereafter, in the shadow of Russian tyranny will stalk the Russian Terror.

Condemnation of the Greek bands, whose recent outrages introduce a new complication into the Macedonian situation, is well enough, but it hardly lies in the mouths of the Bulgarians, who invented this form of agitation. At a mass meeting held at Philipopolis on Sunday, it was resolved to break off diplomatic relations with Greece, and to affirm the inadequacy of the Muersteg programme for pacifying Macedonia. But no race is in sufficient plurality to have a prescriptive right to Macedonia; and the recent atrocities of the Greek bands, while horrible enough, are merely delayed reprisals for years of persecution from many quarters, especially from the Bulgarian side. It is natural that the Bulgars should resent a movement which thwarts their plan for a greater Bulgaria; but it was also to be expected that the Greeks would organize to protect their civil and ecclesiastical rights. The whole imbroglio does, however, show that the Muersteg reforms are entirely inadequate to the situation. When it appeared that the Bulgarian revolution might succeed, a solution of the Macedonian question was fairly in view. Today, that hope is more than clouded. No improvement is to be expected until some mandatory of the European Con-

cert applies to the whole region that rigorous pacification which Austria exemplified so admirably in Bosnia and Herzegovina. But that involves the partition of Turkey, and before undertaking it the Powers will willingly let die any reasonable number of Christians.

"The France of Asia" is the flattering name for Persia devised by the Persian Minister in Paris. He was explaining to a puzzled pressman that the movement towards a Constitution and representative institutions in Persia should really be regarded as no great surprise. Foreign ideas have been long and eagerly absorbed at Teheran. Teachers of European science and civilization have been invited from abroad in great numbers; within a year fifteen qualified professors have been sent from France alone. One member of the Cabinet is Hossein-Khan, a graduate of the Ecole Polytechnique of Paris. Of the coming national assembly—named, literally, the Congress of National Consultation—the Persian Minister has the highest hopes. The Shah, he is certain, in summoning it was but meeting the expectations of the people. It all sounds rather incredible, even to ardent believers in democracy. The most hopeful of them are scarcely ready to think of a Constitution in Persia, and in China! But they will heartily hope that the liberalizing movement in Persia may not be abruptly ended after the fashion of the "roi de Perse" in the fable.

While we are discussing the Pan-American railway, the Pan-African railway is being built. Of the 8,000 kilometres from the Cape to Cairo, one-half is now completed; about 2,500 kilometres from the Cape to the Zambesi, and 1,500 from Cairo to Khartum. In building the central part, England will require the permission of either Germany or the Congo State to traverse a section of the territory; but this will be readily granted because of the advantages of having a north-and-south line to unite the existing or projected lateral railroads. A tremendous gain will accrue to England from the consent of the Negus to use Abyssinian territory, now practically assured. From Khartum to Fashoda it would be impossible to build the railway along the Nile, because of a vast swamp covering ten degrees of latitude. The arrangement with the ruler of Abyssinia will take the road through a most fertile region along the Blue Nile and the edge of the mountains, as far as Lake Rudolph, where English soil will again be reached. France, also, derives great benefit from the arrangement in question, as her railway will now be able to enter the fertile highlands of Abyssinia and there connect with the great Central African line.

DRAWING NEW CLASS LINES.

"Bryan," writes a Hearst supporter, "really does not represent the interests of the workingman, but those of the small shopkeeper and farmer." On this point, Mr. Bryan might easily make answer along the line of a famous passage in his Chicago convention speech. It ran thus: "The farmer who goes forth in the morning and toils all day—who begins in the spring and toils all summer—and who by the application of brain and muscle to the natural resources of the country creates wealth—is as much a business man as the man who goes upon the Board of Trade and bets upon the price of grain." He might say now that the farmer is as much a "workingman" as any one employed in a shop or factory. But suppose it be accepted that for some mysterious reason the interests of the farmer and the small shopkeeper are permanently different; suppose that future political cleavages in this country should be on lines of complete "class consciousness"—how would that affect the prospects of the "workingman's candidate"? We suppose he would concede the right of the despised farmers and shopkeepers to cast a vote apiece, and have it counted. It only remains to ask how many there are of the two groups under consideration.

That discourager of so many attractive theories, the United States Census, supplies the answer. It shows that within the continental United States there were 29,073,233 persons engaged in "gainful occupations" in 1900. They were distributed among the five groups of industries as follows:

Agricultural pursuits	10,381,765
Professional service	1,258,538
Domestic and personal service.....	5,580,657
Trade and transportation.....	4,766,964
Manufacturing and mechanical pursuits.	7,085,309

Thus, at the outset, the group to which the "workingman" belongs is outnumbered considerably more than two to one by the groups in which the farmer and the shopkeeper are found. Even after deducting women and children, the totals remain as 12,403,713 to 5,533,872, respectively. Or one may limit the scope of the classification, cutting out all minor subdivisions, and consider merely the "farmers, planters, and overseers" and the "merchants and dealers (except wholesale)." Of these two classes, again leaving out women and children, there are 6,121,671, as against only 5,601,988 in the whole range of "Manufacturing and mechanical pursuits" from "Carpenters and joiners" to "Upholsterers." Plainly, if the artisans should unite against the farmers and the shopkeepers, every tightening of class lines would mean an additional certainty of defeat.

For the notion that the artisan, the mill-hand, and the like constitute a special class which should be the object of peculiar solicitude and favor, several

causes are responsible. The unions have done all they could to foster the idea. There was no other hypothesis on which two million or so of citizens could claim the right to dictate to the other eighty millions. Yet the protectionist has probably done still more to create the false impression. The cartoonist of *Judge*, for instance, draws the workingman in his square paper cap and the capitalist with his mutton-chop whiskers, as if they represented the entire interest of the country, so that the full dinner-pail for one and the fat bank account for the other stood for universal prosperity. Yet Edward Atkinson showed from the official figures that at most 14 per cent. of the people of this country are supported in industries directly benefited by the tariff. Protectionists believe that prosperity engendered among "producers" will diffuse itself throughout the nation; yet they do not dwell on the fact that the group from which this beneficent influence spreads includes so small an element, while 86 per cent. of the population receive their tariff blessings at second hand.

Attempts to array the rich against the poor, the employed against the employer, labor against capital, are nothing new even in this country. But such a break between different groups of the oppressed is somewhat novel. Is not the Trust giant smiting with impartial bludgeon the farmer, the shopkeeper, and the workman? Extortionate selling prices, inadequate buying prices, illegal discriminations are certainly taking money out of the pockets of all three alike. Yet that is not a cohesive issue for the "toiling masses" only. The professional classes, the domestic servants, in fact all but a minute fraction of the voting population, agree with Mr. Hearst or Mr. Bryan or President Roosevelt or any one else who preaches against special privilege. For this, the most genuine grievance, is the one which there is least excuse for attempting to make a class issue.

It has always been the pride and the distinction of American political parties that they have drawn members from all social and industrial classes alike. There is nothing in the present situation to justify a change in this historic policy. It is possible sometimes for a smaller group to hold the balance of power, locally and for a time, as organized labor is attempting to do in the Congressional elections. But avowed exclusive devotion to one element would be the very surest way of reducing either of the great parties into a petty faction, or a public menace.

THE VACILLATING CZAR.

The unexpected dispatches, stating that the Russian Government will proceed at once to the distribution of 20,000,000 acres of public land among the

peasants, raise more questions than they answer. The plan is announced as in part political. By doing a popular act, and granting what is admitted to be an instalment of long-delayed justice, it is the Czar's hope that he may get a "docile" Duma next time. But the result might easily be the opposite. The peasantry may take this concession merely as one extorted through fear—really a confession that the policy of autocratic repression is breaking down in the Government's hands. Something has to be done; so this sop is thrown to the peasants; but strange thoughts are evidently astir in Ivan's head, and he may conclude that all he has to do is to keep on threatening and mutinying and massacring in order to get much more. The second Duma may prove more indocile than the first.

Besides, it is necessary to ask how far the scheme of land relief will go, before deciding that it will be popular, much less accepted as a permanent solution of the agrarian question. On this point the figures are eloquent. We follow a Russian writer in the *Journal des Débats* of June 20. He shows, first, the enormous preponderance of the agricultural population in Russia. According to the Imperial census of 1897, it amounted to 112,000,000 out of 129,000,000 people in all the Empire. Probably to-day it numbers 125,000,000 out of 145,000,000—six-sevenths. Thus Russia is by far the most "rural" country in Europe. Yet more than half of all the land is owned by the state and the communes. The Russian Government is the greatest landed proprietor in the world. In the various forms of crown lands, appanages, etc., it owns some 400,000,000 of acres. Only a small percentage of this, however, is suited for agricultural purposes. The larger part is forest and swamp. Hence it would be impossible for the Government to satisfy the vast land hunger out of its own reserves merely. It is now proposed to distribute some 15,000,000 acres of public lands. The authority we are following estimates that very little more than that is actually available for tillage. But what is this among so many? Will not this bare beginning inevitably drive the 100,000,000 landless peasants forward to the plan of expropriating the holdings of the great landlords? And how can such a project be financed? Certainly not without the Duma; and it may be the Government that will be "docile" when it has to go to the representatives of the people to ask for loans and financial guarantees.

This first step in land distribution is plainly taken only because the Czar's counsellors perceive that the peasantry is seething with discontent and revolt. The first taste of popular institutions among the peasants has altered them radically. Many landlords who went to

visit their estates after the Duma began its sittings, returned to the capital saying: "We do not recognize our peasants. They have changed completely since the elections to the Duma." The servile *mujik* is a thing of the past. And that is the very reason, as the great authority on Russia, Anatole Leroy-Beaulieu, explained in advance, why this stop-gap plan of land apportionment will not do. The peasants have their eyes opened at last. They have lost their old simple faith in the Little Father who would do justice, did his courtiers permit him to know the facts. They see that the Grand Dukes are the greatest and richest landlords, and will not hear of a law of even partial expropriation. No more will the Church. And the attitude of the peasant Deputies in the Duma made it pretty certain that, as M. Beaulieu writes, when once it is clear that the Imperial family is the great obstacle to the distribution of land, the peasant will have been "captured for the revolution." There may even be, thinks this cautious and informed French observer, "an overthrow of the throne."

This is very like what the best English authority on Russia, Mackenzie Wallace, writing from St. Petersburg on August 11, predicted in the *London Times*. He foresaw the coming of a time of "internal ferment, compared with which all the disorder, pillaging, and assassination of the past months will have the appearance of public order." Indeed, another correspondent of the same newspaper reports a statement made full three years ago by a prominent Russian, since known as a Constitutional Democrat. Even at that date he was appalled at the success of the propaganda of the extremists. He said:

Neither you nor any other foreigner knows, very few Russians know, the progress these men have made among the peasantry and workmen, in the face of what seemed insurmountable difficulties. But I have made it my business to keep in touch with their agitation, and I assure you that I am almost appalled at the way in which it has grown and is still growing. They have won such support from the people that I frankly doubt whether it is any longer possible to save Russia from a bloody revolution. In view of the bitter discontent which is steadily growing among all classes of the population, the Government will, sooner or later, be forced to try to conciliate public opinion by some real or pretended concessions. But it will be too late. It is already too late. So soon as the bureaucracy shows a sign of weakness, the revolutionary movement will become irresistible. Reforms which would amply satisfy us will be of no avail against the new forces which are being roused throughout the country. The uneducated masses will make demands which it will be impossible for any Government to grant. There will be an appeal to force, and the result will be a chaos.

Depressing and alarming as this

prophecy is, it reads amazingly like a description of the course of events as we see it unfolded. Nothing, in fact, has occurred since the abrupt dissolution of the Duma to alter the conclusion that it was a monumental blunder. The Czar should have come to terms with the Moderate party. In the next Duma, there may be no moderate party.

ARCHITECTURAL COMPETITIONS.

There is considerable discontent in professional circles with the prevailing habit of architectural competitions. The dissidents take the view either that competitions are clumsily managed and unfairly judged, or else that they are uneconomic and vicious in principle. Representing the first class, a prominent architect asserted in the last general meeting of the Institute that Mr. McKim's plans for the University Club in New York would never have received an award in a competition. The statement was undisputed, and certainly indicates that there usually is something amiss with the programmes, the judges, or the competing architects. The smaller class which regard competition not only as subject to perversion, but as unjust *ab initio*, offer a plausible but not wholly convincing moral argument for their case. It is illustrated in a clever skit by Mr. Henry Rutgers Marshall, in last month's *American Architect*, in which he imagines the Architectural League proposing a competition among lawyers in order to choose its solicitor. The fairly grotesque terms, the inadequacy of the reward, etc., are borrowed with the slightest alterations from the programme for the new buildings of Union Theological Seminary. The inference is that such a competition is an affront equally to the legal and architectural professions.

The moral objection may be more concretely stated as follows: Ten established firms are invited to enter a competition for a million dollars, being promised a thousand dollars apiece as indemnity for the expense of preliminary designs. But the regular fee for preparing such designs would be in every case one per cent., or ten thousand dollars. In other words, the building committee receives, in nine cases, at a thousand dollars a service worth ten. This argument, however, is too mathematically good to be true, and falls to the ground when it is recalled that no architect can be compelled to enter a competition. The system could any day be defeated by an agreement of the best firms to stay out. On the other hand, it should be noted that established firms do compete under protest, with a sense that the method is very defective, and subject to grave miscarriages of justice.

Into the matter of log-rolling, playing up to the taste of influential mem-

bers of the jury, we will not go, because these are defects inherent in any such rivalry. If the profession of architecture is worse off in this respect than the others, it behooves the authoritative bodies to assume a severer attitude towards unprofessional conduct. There is, however, much to be said against a system that uneconomically brings out, say, fifty designs where a single building is required, and tends at least to eliminate the best firms and leave monumental buildings to be scrambled for by mediocrities. But all this is largely a matter of methods. Because invitation competitions are insufficiently paid is not a reason for abolishing them, nor is the frequent holding of open competitions, where limited contest would be advisable, a cause for despair. What we want is clearly a class of advisers and judges, such as actually exists in France, capable of drawing up simple and rational programmes, beyond personal influences, and fully aware of the mere tricks of the draughtsman which would pass for substantial design. In short, the most serious criticism of competitions among us lies not so much against the system itself as against the average committee and jury.

When it is remembered that young architects almost always commend the system, changing to the other opinion only after they have arrived, it will be felt that the practice has at least the merit of encouraging rising talent. For this reason alone, we should be sorry to see the admittedly uneconomic open competitions wholly done away with. We feel that it is unwise to trust to the hazard of such a free-for-all any very important building; but there is a whole class of smaller structures of a public or semi-public character where open competitions seem eminently in place. With respect to the greater commissions, we can only say that it is absurd to expect a firm that is prospering to encounter unpaid the chances of a large field; furthermore, that it is unfair to ask such a firm to compete, without at every stage fully repaying the costs of competition. Experience has taught, too, that in most cases the best results are obtained without competition by selecting the architect directly.

But right here appears the human and unprofessional side of the problem. An individual may fairly succeed in picking his man, but the great buildings are rarely in the hands of individuals. A corporation, lay or ecclesiastical, will practically have the greatest difficulty in making an impartial choice. As many competent architects may be in sight as there are stockholders or pew-owners. When the rebuilding of St. Thomas's Church was broached, it was found that some forty architects had substantial backers in the parish. Under such circumstances, what is there for it but the Apostolic method of casting a lot,

or else some form of competition? It was undoubtedly this motive that led the Commune of Florence in the old time to put out so many of its monuments at competition; and the same solution is likely to be sought whenever direct choice of an architect seems impossible.

By a natural misapprehension of the scope of competitions, they have been criticised as a bad way of selecting a building. As a matter of fact, they never are a way of selecting a building. The artfully tinted drawings that win the suffrages of juries have the very slightest relations to the building that is to be. At best, they are merely an indication that the winner of the competition will work out an acceptable building. As a method of choosing an architect—the real difficulty for building committees—there is much to be said for competitions. They afford, if frequently a lame conclusion, at least a conclusion where otherwise there might be an interminable deadlock.

Looking at the situation broadly, the following advice might be tentatively offered to clients: (1) Choose an architect directly if you can; (2) for a monumental building, hold a limited and properly paid competition if you must; (3) for an ordinary building, hold an open competition, if you will. Finally, architects will probably have to put up with a system generally unsatisfactory from a professional point of view, so long as it affords an obvious convenience to that soulless but indispensable entity—the average corporate client.

THE READING OF FARMERS.

Statistics of circulation in the travelling libraries of Wisconsin throw an interesting light upon the reading of the farmers of that State. When the system was started seven years ago the circulating boxes were plentifully stocked with works on agriculture and nature books, a careful selection of the best and most popular being made. But it was found that the Wisconsin farmer will not read such books under any inducement. He desires no advice about his crops, and is incurious as to the birds, beasts, and plants of his neighborhood. The "How to Know" and similar books had, however, a splendid reading in the towns. The farms showed an equally feeble demand for works on economics, finance, and civic improvement. Even discussions of the labor problem were persistently neglected. History, too, found very few devotees. In fact, nothing is more striking about the bucolic taste in letters than its complete contemporaneity.

This appears in the first class of books which the farmers of Wisconsin do read. Biography has fallen below the expectations of the literary bureau, but for lives of persons of current no-

toriety there is a considerable demand. The only solid reading that is really popular on the farms is travels. Fiction, both standard and current, is eagerly devoured there as elsewhere. We believe we may consider Wisconsin in this matter as fairly representative of the country at large. Sojourners on New England farms will confirm the triple categories of recent biography, travel, and fiction. The books that are likely to be in every prosperous farmer's library are such biographies as the Grant Memoirs, Blaine's "Twenty Years in Congress," and the lives of such notable divines as Beecher, Moody, Spurgeon, etc. Many New England farm-houses of the better class possess the entire series of Livingstone and Stanley, to which are frequently added the chief Polar expeditions, and more rarely, the travels of Sven Hedin and other Asiatic explorers. The Alpine books of Whymper are rarer, but not unknown. Fiction, by grace of the summer boarder, abounds, and the taste for it is apparently indiscriminate. Where New England might perhaps claim a superiority over Wisconsin is in the matter of devotional and theological works. There has been and is a considerable public for such harmonizing treatises as those of the late Henry Drummond, on science and religion. The Wisconsin statistics are silent as to those rural character-sketches comprised in the so-called "b'gosh school," but it is safe to say that these are very little read in the neighborhoods whence the various Uncle Ephraims and Aunt Sabrinas are drawn. Caricature is, in fact, rarely greeted with enthusiasm by the travestied persons.

One need not be a profound psychologist to realize why farmers do not read for self-improvement. Even in these days of the telephone and trolley car the agricultural life is a comparatively monotonous one, and if the toiler reads at all, it is for recreation solely. A natural curiosity leads him to explore the lives of his political and ecclesiastical heroes; a vague longing for wider boundaries, for something of romance, explains the taste for fiction and books of travel. For many a community the itinerant missionary represents strange lands and peoples, the steamy breath of the tropics, and the feathery palms. He is the natural forerunner of the book agent with African and Asiatic, not to say Polar, adventures to sell. The Wisconsin and all other statistics fail us on an interesting point, namely: What books are read by Philemon, what by Baucis? We think it no unfair supposition that "Twenty Years in Congress" and the Stanley travels are read by father, and the "Dolly Dialogues" and Zenda books by mother, after the supper dishes have been put in the cupboard.

It would be interesting to carry the analysis closer and inquire what novel-

ists are read in the country. From observation, limited to be sure, but extending over several years and including many districts of New England, we confidently say that Howells and James are not read on the farms. Apparently, the objection of Mr. Owen Wister's "Virginian" that nothing happens in such books, damns them among our sturdy Easterners also. Curiously enough, Mr. Cable was read, apparently, for his exoticism. Mark Twain's earlier books, especially "Roughing It" and "Innocents Abroad," have usually been present in book-cases under our observation. Of recent years the more knowing society novels have put in an appearance; but these glimpses into Mayfair and Cosmopolis are, as we have hinted, due rather to the summer boarder than to the bucolic demand.

Of course, all inferences from statistics of travelling libraries and inspection of farm-house living rooms are vitiated by the all-pervasive magazines. Through clubs, the monthlies are very extensively circulated, and there is no means of knowing which portion of the fare provided by the editor is best relished by the farmers of the land. One may fairly assume, however, that the preponderance of fiction is what attracts the up-country districts, as indeed it does the towns. The slack demand for the works of publicists shown by the Wisconsin statistics suggests that the muck rake may not have stirred the country soil very deeply. Its havoc has been, perhaps, largely confined to city thoroughfares. There is nothing in the taste for romance that forbids us to believe that they are canny folks "in the deestrics" and rather "sot in their ways" as regards both their reading and believing. If our theory that farmers read chiefly for recreation be true, it is no wonder that they decline to be caught in the present quasi-sociological freshet.

THE TEACHING OF LATIN—A CRITICISM AND A REMEDY.

During the last thirty years the teaching of Latin in the high school has been almost completely revolutionized. The change has been due to a conviction that the old method was not adapted to modern conditions, and that loss of Latin as the chief representative of classical culture was due to the method of teaching rather than to the study itself. If the changed conditions could be adequately met it seemed that no further decay was to be apprehended.

These considerations were sound. The position of Latin and the method of teaching it were the heritage of the Middle Ages when Latin formed the greater part of the training of youth for every pursuit in life. It was, therefore, a practical study intended to be immediately useful, and the training in it was detailed and extensive. In modern times, however, the pressure of so many other subjects upon the at-

tion of the school led to a progressive curtailment of the time that could be given to Latin, without any particular change in the method of teaching it, and the result was a progressive diminution of the net result of knowledge and an apparent diminution in its effective value as culture.

Two suggestions for improvement were made; one with regard to the introductory training, the other with regard to the authors read. The introductory book was restricted in compass, and greatly modified in method. The old idea of learning by heart large masses of paradigms, lists of exceptions, and multitudes of unimportant details was abandoned, and the essential facts were presented in small sections, so that the student could make immediate use of his knowledge. The vocabulary was restricted to the words used most frequently by Cæsar and Cicero, and various devices were employed to produce interest. The commentaries on Cæsar, Cicero, and Virgil became marvels of exegetical and illustrative material; ethnology, geography, statistics, comparative religion, comparative philology, military science, law, archæology, art, all contributed their share, until the notes were often twice as extensive as the text. And yet, in spite of this, the criticism was made that students came up to college with a smaller knowledge of Latin than they exhibited forty years ago, and, still worse, left college unable to read a passage of ordinary Latin except with an effort, which after a few years became almost prohibitive.

To meet this difficulty, some institutions, under the lead of Harvard University, modified their entrance requirements so that entering students were required to translate, not passages from works previously read, but passages hitherto unseen. Undoubtedly, good results were gained from this requirement, but it appears that even here no definite plan of instruction was pursued, and, furthermore, that the advantage obtained by the student at entrance was lost in the subsequent college training. Accordingly, it now appears that, while Latin is increasing proportionally in the secondary school, it is still losing ground proportionally in the colleges, and that the knowledge shown by students on leaving college indicates no signs of betterment.

Several remedies may be suggested. In the first place, it cannot be too strongly emphasized that the habit of making the classics the occasion for instruction in ancient history, life, and art is fundamentally unsound. While Latin will be retained, and should be retained, largely on account of its exceptional value for mental training, it is, nevertheless, just as unquestioned that the influence of this language for centuries has been due largely to the value of the literary masterpieces which it embodies. Now, any scheme of instruction which minimizes the study of the Latin authors as literature fails to do justice to the study. Livy and Tacitus are not the places to study Roman history. Roman mythology should not be the essential feature in reading Virgil. Public law is not the main reason for reading Cicero. It may be laid down as a fundamental principle that little more should be expected from a student in Latin than could be reasonably expected from the ancient

Roman reader of that day. The Roman who read Cæsar's "Commentaries" possessed no other information as to the ethnology of Britain or Germany, and lost nothing by his ignorance. Why should more be demanded of our luckless schoolboy?

Now, to read a Latin author with readiness and appreciation requires knowledge, and it is here that my chief criticism of the present method of instruction applies. An acquaintance with paradigms and with the essential laws of syntax is necessary, and is everywhere demanded. But even with the knowledge of paradigms and syntax, the student will be unable to read if he does not possess a knowledge of words. In the old method it was supposed that this knowledge would be gained by assiduous thumbing of the lexicon; but any one who has gone through school and college cannot fail to remember how little actual progress was made in the preparation of any one lesson in this essential matter of word-knowledge. The prime necessity in teaching Latin at the present day is, accordingly, the systematic study of words. This study is no new thing. The most distinguished scholars, both in Europe and here, have emphasized it time and time again. But, as far as I know, no definite system has been devised applicable to our present conditions.

For the study of words no language possesses such unique advantages as does the Latin. Its vocabulary is marvellously compact as well as efficient, and therefore more can be done with a small number of Latin words than can be done with the same number in any other language. The authors read in schools prove this. The first five books of Cæsar's "Gallic War" show a total of 2,120 words. The six speeches of Cicero read in the schools show a total of 2,158 words. The total vocabulary for the first six books of Virgil's "Æneid" is 3,229 words. The total word-list of these three authors comprises only 4,683 words. Now, it goes without saying that, in the study of vocabulary, those words should be particularly emphasized which occur most frequently, and for the purpose of my study I have culled out those which occur in the selections mentioned five times or more. The total number is 1,929. That these words are representative I have tested by taking a class through the "Civil War" of Cæsar, the "Pro Roscio Amerino" of Cicero, and four or five books of Ovid's "Metamorphoses." I found that, of the words to which I have alluded, 1,900 appear in the authors I have mentioned, and that, with the knowledge of the meanings of those 1,900, my students were able to read without difficulty and without consultation of the lexicon.

If, therefore, during the four years of his training in the high school, the pupil were required to acquaint himself thoroughly with approximately 2,000 Latin words, he would have at hand fully nineteen-twentieths of the total vocabulary of any Latin author of literary value which he would meet. Several other considerations reinforce this argument. The 2,000 words to which I have alluded contain more than 800 verbs, of which the majority are simple verbs. If the student has, in addition to this knowledge, even rudimentary acquaintance with the principles of Latin word formation, he has really at his control

a vocabulary very much more extensive than would appear on the surface. In addition, it is to be remembered that a large amount of our English vocabulary is Latin, and that, while deducing the meaning of Latin words from their English derivatives is dangerous, nevertheless in the case of a large number of abstract ideas particularly, the English word and the Latin word are practically equivalent. It is, therefore, in the case of Latin, not a serious matter to provide students with such a working vocabulary that they will be able to read ordinary prose, and the narrative poetry, with very little, if any, greater difficulty than we should find in reading similar German or French. Not infrequently strange words will appear in Latin as they would in the modern languages, but it is surprising how often these words can be elucidated from the context, and how little is lost from the general impression if they remain unknown. Now, if these considerations are sound, it follows that in the reading of texts in school and college the procedure that is usually followed should be reversed. Instead of assigning a passage of so many lines to be prepared for the morrow, the teacher should inform his class how much in the next lesson is new, should insist that they be acquainted with the required vocabulary up to date, and should add to their available list those words in the new lesson which are essential to further progress. Words that occur but once or twice should not be emphasized, and if necessary the meanings should be imparted, but the student should be expected to use the knowledge that he has and the knowledge that is provided in advance to make his translation. If this is done, it will be but a short time before a sense of power will develop in the student's mind which will be worth hours and hours of drudgery. He will begin to feel that instead of the lesson being a puzzle which he is to make out, it is a picture which he is to enjoy, and one of which he already possesses the clue.

Of course, training in the method of translation is also essential, inasmuch as the genius of the Latin language differs from that of the modern languages, but after all, the most important requirement for reading a language is a knowledge of the meaning of words, and by the system I suggest, with the list I have indicated, that knowledge can be imparted, not merely with ease, but with a definiteness and assurance which has never yet been known.

GONZALEZ LODGE.

Teachers College, Columbia University.

FIRST EDITION OF "THE SCHOOL FOR SCANDAL."

Sheridan's play was first produced at Drury Lane Theatre, May 8, 1777, and was played successfully at intervals for a long period. No edition was printed in London for a number of years, although several came out in Dublin within a few years of its first production on the stage. The edition usually considered the first has the imprint "Dublin, for J. Ewling," but without date. Mr. Anderson, in the bibliography affixed to Sanders's "Life of Sheridan," suggests for it the date of 1777, while Mr. Pollard, in a recent bibliographical note, says that it was printed "presumably during the

course of the next year after it was first acted, that is, 1778." The date generally affixed in booksellers' and auction catalogues is 1781. In Part VI. of the McKee sale in 1902 a copy with imprint "Dublin: Printed in the Year, 1781," was offered, with the following note:

In all probability this is the genuine first edition of Sheridan's famous comedy. It is a matter of record that a manuscript copy of the play was sent over to Mr. Thomas Ryder of the Dublin Theatre, and as he, himself, assumed the character of Sir Peter in the representation given at his own theatre (see cast), the presumption is strong that his publication of the play preceded that of Mr. Ewling's, which bears no date.

But an edition with earlier date than this, apparently undescribed, certainly exists, with the title:

The | School for Scandal, | A | Comedy; | As it was performed at the | Theatres Royal, | in | London | and | Dublin. | Dublin: | Printed in the Year M,DCC,LXXX. |

It is a very poorly printed pamphlet of forty-two leaves, in appearance looking like a pirated edition, or one got out in a great hurry for the use of actors. The *dramatis personæ*, on reverse of title, does not contain the printed names of the actors, though, in the copy examined, these have been written in. A word-for-word comparison of this and the undated edition printed for Ewling has been made in an effort to discover which is actually the earlier. The differences, comparatively few in number, show almost conclusively that either one was printed from the other or both from a common manuscript which was followed pretty closely. "End of the First Act," etc., are found in the 1780 edition, but not in that of Ewling. Exits read, "Exit Snake," etc., in the 1780 edition, while that of Ewling generally has "Exit" only. Line 3, page 2, in Ewling edition, has "in their lives," while the corresponding phrase in the 1780 edition is, "in the whole course of their lives." This is the greatest textual difference, and, if it be taken as a basis, we are obliged to call Ewling's edition the earlier, as later editions, after the play had been revised throughout by the author, read, "in the course of their lives." "Drote" for "droit" and "done" for "donc," simply show that the Irish printer of the 1780 edition understood no French. "Preserve youth," in line 24, page 34, of Ewling's edition, becomes "ruin youth" (exactly opposite and wrong), in the 1780 edition. "Lies in question," in line 31, page 90, of the Ewling edition, reads, in the 1780 edition, "lying questions," the latter being wrong. Most of the differences, in fact, are mistakes of careless printers. Ewling's edition is fairly well printed, and has a considerable list of errata, while the 1780 edition is a very roughly printed piece. On the whole, it seems as if the edition printed for Ewling may retain its position as the first edition, although this heretofore undiscovered edition of 1780 may have the honor of being the first dated edition.

It is worth noting that the first American edition of the play, printed in Philadelphia, in 1782, by Robert Bell, and called on the title-page, "The Real and Genuine School for Scandal," was certainly printed from this 1780 edition, or a very accurate reprint of it. Most of the misprints, such as those of the two French words noted above,

are copied. The Philadelphia printer, however, saw the obvious nonsense of the phrase, "ruin youth," and was able to correct the sense, though he did not light upon quite the correct word. He printed it "save youth."

I have examined, also, another American edition, printed by Hugh Gaine in New York in 1786. The title-page states that it was printed "From a Manuscript copy in the possession of John Henry, Esquire, joint manager of the American Company, given him by the author." Below the *dramatis personæ* is the following advertisement:

So many spurious Copies of The School for Scandal having been obtruded on the Publick, has induced the Editor to lay before them, in its proper Garb, this most excellent Comedy, presented to him by Richard Brinsley Sheridan, Esq.; the justly admired Congreeve of the present Times.

In the same connection as the paragraph already quoted, Moore in his life of Sheridan, says:

The edition printed in Dublin is, with the exception of a few unimportant omissions and verbal differences, perfectly correct. . . . I have collated this edition with the copy given by Mr. Sheridan to Lady Crewe (the last, I believe, ever revised by him), and find it correct throughout.

Then, in a footnote he gives one of the alterations made by Sheridan in Lady Crewe's copy:

Lady Teazle, in her scene with Sir Peter in the second act, says: "That's very true, indeed, Sir Peter; and after having married you, I should never pretend to taste again, I allow." It was thus that the passage stood at first in Lady Crewe's copy, as it does still, too, in the Dublin edition, and in that given in the collection of his works, the original reading of the sentence, such as I find it in all his earlier manuscripts of the play, is restored: "That's very true, indeed, Sir Peter; and, after having married you, I am sure I should never pretend to taste again."

There is some discrepancy of statement here which I cannot explain. Lady Teazle's speech as given in full by Moore in his edition of Sheridan's Works (the above is quoted from the Life) is as follows:

That's very true, indeed, Sir Peter; and after having married you, I should never pretend to taste again, I allow. But now, Sir Peter, if we have finished our daily jangle, I presume I may go to my engagement at Lady Sneerwell's.

The same speech by Lady Teazle in three Dublin editions (the one dated 1780, the one printed for Ewling, and another later undated edition) reads:

Why then you force me to say shocking things to you. But now we have finished our morning conversation, I presume I may go to my engagements at Lady Sneerwell's.

While in the Gaine edition, printed from a manuscript by the author, the passage reads:

Aye! that's very true, indeed, after having married you, I never should pretend to taste again. But now, Sir Peter, as we have finished our daily jangle, I presume I may go to my engagement at Lady Sneerwell's

It is evident, therefore, that if Moore had by him a copy of some Dublin edition reading as indicated in his note, it must have been of a more recent date. L. S. L.

Correspondence.

HISTORY, ANCIENT AND MODERN.

TO THE EDITOR OF THE NATION:

SIR: Columbia and Yale may be warmly congratulated on an innovation that is to mark the opening academic year. They have decided to join forces so as to constitute a department specially adapted for students who wish to fit themselves for Government employment, consular, colonial, or diplomatic. Incidentally, the same training will be of service to others, to those who merely wish to understand Administrative problems, or world politics, to journalists, even to missionaries. Commercial and international law, European and Oriental languages, commercial geography, consular and diplomatic practice, economics, modern history, and other allied subjects will be taught. This is all as it should be, and corresponds with a need which our historic growth as a nation has now brought on us.

On this text much might be written, but the present purpose is to advert to one branch only of these studies, the one that must answer the purpose of foundation for all the others, that is history. What is being done by Columbia and Yale is a hopeful symptom for the future of historical studies in this country. For it brings into sharp prominence the utility of studying recent history and the further fact that the history of the nineteenth century—to fix a convenient period—is one requiring a special approach. Whereas the study of the ancient world and of the Middle Ages tends dangerously to become an academic routine, in which research is merely the road to the doctorate and the professorial chair, the history of the years just behind us should be an introduction to practical life, a guide to the evolution in political thought and political methods from which the ever-changing fabric of human society as we move in it to-day has been woven. This branch of history, so different from the old academic history, is a practical study, giving to the administrator, the diplomat, the man of the world, the politician, the journalist, a comparative point of view whereby he can judge more effectively how this, that, or the other event he has to deal with stands in the world's evolution and the struggle of nations.

Nothing here written is meant to imply criticism of the very excellent work done in the history departments of our universities. On the contrary, it is certainly the case that the standard set has been tending steadily upwards of recent years. The trouble has been merely the non-recognition of the fact that if the remote past was worthy of study, the immediate past is equally worthy, and, additionally, that its lessons may have practical, or let us say, technical, value.

It was the logical minded French who first perceived the need which the modern world has of drawing by scientific methods lessons from yesterday to guide its way to-morrow. A small group of eminent Frenchmen, Boutmy, Taine, Albert Sorel, Paul Leroy-Beaulieu, and others, judging that the national catastrophe of 1870-71 had proceeded largely from ignorance of political science in all parts of the community, decided that this ignorance should be reme-

died by instruction. This was the starting point of the now-famous *École des Sciences Politiques*, an institution concerning which two remarks must here be made. The first is that, taking the history of the world since 1789 as the foundation of its teaching, it has never copied the methods of that older and also excellent institution the *École des Chartes*; its aim has been constantly practical, never academic. The other remark is that no institution of modern France has shown such sudden and such splendid results. Whereas the France of the Second Empire and of many of the early years of the Third Republic was crassly, suicidally, ignorant of the elements of political science, now, within the last few years, a most remarkable change has taken place, largely the work of the *École des Sciences Politiques*. Frenchmen now write on colonial, international, economic questions, statistics in hand and firmly grounded in political and historical knowledge, and the old lies and fairy tales of the Boulevard prints, long the laughing stock of Europe, are fast becoming *vieux jeu*.

R. M. JOHNSTON.

Cambridge, Mass., August 27.

THE MS. OF EVELYN'S DIARY.

TO THE EDITOR OF THE NATION:

SIR: The new edition of Evelyn's "Diary and Correspondence," by Mr. H. B. Wheatley, the accomplished editor of Pepys, has been awaited by scholars with interest. The original editor of Evelyn, like those of Pepys, has omitted large portions of the diary, and additional material of considerable importance was expected in this new edition. Mr. Wheatley, however, has been able only to reproduce Bray's text, for the present owner of the manuscript has refused to permit a new inspection of it. A similar difficulty of my own had prepared me for this result; and as my experiences may serve to illustrate the annoyances which work on such an edition as this entails, they may not be without interest to your readers.

The Diary, letters, and other manuscripts of John Evelyn are now in the possession of a descendant bearing the same name, who has also inherited the ancestral estate of Wotton Court. One of these letters I was anxious to include in a work which I am editing for the Clarendon Press, and Mr. Sidney Lee kindly consented to intercede for me with Mr. Evelyn so that I might procure a transcript of the letter. Mr. Evelyn, who is now of a very advanced age, replied that he had presented all the MSS. at Wotton to his son, and that no one but this son could give access to them. Mr. Lee thereupon wrote to the younger Evelyn, who, in reply, regretted that he was unable to permit an inspection of the letter, as his father objected to having the MSS. disturbed in any way! All the papers were carefully stored away, and there was no reason to doubt the accuracy of Bray's original transcription.

I was not wholly satisfied by this assurance, and on the recent visit of Dr. J. E. Sandys of the University of Cambridge to this country I casually mentioned this difficulty to him. He offered to obtain the assistance of Mr. Frederic Harrison, whose family were neighbors of the Evelyns at Wotton, and who might gain as a friendly

favor what the interests of scholarship had failed to secure. The efforts of Mr. Harrison were, however, no less futile than those of Mr. Lee; and so, like Mr. Wheatley, I shall be obliged to rest content with Bray's antiquated transcript. It will appear *perforce* in an appendix, for every other of the many texts in my three volumes has been transcribed from the original.

The Diary of Pepys is in the possession of an academic institution; it is always open to the inspection of competent scholars; and successive editors have added such new material as a growing interest in Pepys and a fresher conception of scholarship have demanded. The Diary of Evelyn is in the hands of a private owner, who is wholly unaware of its historic import and wholly out of sympathy with the humane studies of his distinguished ancestor. Surely a public document of this sort belongs rightfully to a public institution, and no student of English letters will rest content until it has found its way into the British Museum.

But there is still another observation which this incident suggests. The charge of sordidness and unenlightenment which is so often brought against American collectors and bibliophiles may receive a wider application. Vandals and Goths may flourish among the country estates of England no less than in the stockyards of Chicago.

J. E. SPINGARN.

Columbia University, August 27.

[Every scholar will feel with Mr. Spingarn in his indignation at such nigardly treatment. At the same time a possible mitigation of this judgment may be found in the notice of the book printed on another page.—ED. NATION.]

DE MILLE IN HALIFAX.

TO THE EDITOR OF THE NATION:

SIR: I submit that Mr. Burpee's interesting letter to the *Nation* about De Mille was not entirely just to the people of Halifax. The estimation in which Halifax people held De Mille was substantially that in which he seems to be held by Mr. Burpee himself. I am sure that Mr. Burpee is mistaken in supposing that Mrs. Scott Siddons discovered him for the people of Halifax. I well remember the occasion of the reading referred to; Mrs. Siddons prefaced it with the statement that it was by request. Unless Mr. Burpee has evidence to the contrary, I should have assumed, as most of us did at the time, that Mrs. Siddons knew little or nothing about De Mille before her attention was drawn to his works by some of his Halifax admirers. After De Mille's death the manuscript of a poem was found among his papers, which was edited by Prof. Archibald MacMechan of Dalhousie University, Halifax, and published by T. C. Allen & Co., Halifax. I suspect that the greater part of the subscriptions, without which the volume could not have appeared, came from Halifax, or, at least, from Nova Scotian admirers of the author. Mr. Burpee has made no reference to this work. There are many Halifax people, among whom I number myself, who would be glad to have his critical opinion of the poem.

B. RUSSELL.

Halifax, August 18.

Notes.

Bard, Marquardt & Co. of Berlin will publish shortly a work in two volumes on Ibsen, by Prof. Georg Brandes.

The Cambridge University Press is about to issue the "Interlinear Bible," giving the authorized and revised versions in this incongruous form.

A new volume by George Frederick Wright on "Scientific Confirmations of Old Testament History," will be brought out by the Bibliotheca Sacra Company, Oberlin, O.

A translation by Mr. R. H. Hobart of "The Life and Works of Vittorio Carpaccio" is to be published soon by John Murray. The "Life" is the work of the late Prof. Gustaf Ludwig and of Prof. Pompeo Molmenti, the distinguished Venetian historian.

Kipling's "Puck of Pook's Hill" will be issued by Doubleday, Page & Co. early in October. The illustrations are by Arthur Rackham. The same firm has taken over the other books by Upton Sinclair besides "The Jungle," and will reprint them in revised editions.

Gustav Kobbè has added a "How to Appreciate Music" to the list, already long, of guide-books to culture. It will be published in September by Moffat, Yard & Co. On the same list are "Behind the Scenes with Wild Animals," by Ellen Velvin, and "The Von Blumers," by Tom Masson.

Prof. George William Knox, who for many years lived in the East, has written a book on "The Spirit of the Orient," now announced by Thomas Y. Crowell & Co. It deals with the new relations of Japan and the East to the Western world since the war.

Edwin Markham is preparing a volume of selections from the writings of the much-discussed mystic, Thomas Lake Harris—regarded by some as a prophet, by others as a charlatan. The biography of Mr. Harris, who died a few months ago, will probably also be written by Mr. Markham.

E. P. Dutton & Co. have ready for immediate publication Budgett Meakin's "Life in Morocco," which gives an intimate picture of native existence such as is not commonly seen by foreigners. Later they will publish "A Child's Recollections of Tennyson," by Edith Nicholl Ellison, a daughter of the late Dr. Bradley, who succeeded Stanley as dean of Westminster. The book promises familiar and even amusing glimpses of the Laureate at home.

A series of critical biographies, whose character is sufficiently indicated by the title "Modern Poets and Christian Teaching," is coming from Eaton & Mains. The volumes ready this autumn will be: "Robert Browning," by Frank C. Lockwood; "Richard Watson Gilder," "Edwin Markham," and "Edward Rowland Sill," by David G. Downey; "Matthew Arnold," by J. M. Dixon; "Mrs. Browning," by Martha Foote Crowe, and "Lowell," by W. A. Quayle.

To commemorate the 250th anniversary of the settlement of that famous Massachusetts town, Alice Morehouse Walker has written a book on "Historic Hadley," to be published by the Grafton Press. The same

house is preparing a "History of the Ohio Society of New York," by James H. Kennedy, and the autobiography of Colonel Richard Lathers, edited by Alvan F. Sanborn, under the title of "Reminiscences of Sixty Years in South Carolina, Massachusetts, and New York."

Chapman & Hall in London (the American importer has not yet been announced) are preparing a "National Edition of the Works of Charles Dickens" to be completed in forty volumes. It will include more than a hundred pieces hitherto uncollected, chiefly from his anonymous contributions to *Household Words*; the full series of Letters now first chronologically arranged; the "Poems, Plays, and Speeches," and the "Life" by Forster, illustrated by a complete series of portraits. The first two volumes will appear in October. The edition is to be limited to 750 sets for England and America.

Duffield & Co. issue to-day a book by Mrs. N. S. Shaler called "The Masters of Fate," which deals with the power of the will to overcome the seeming disadvantages of life. Says Mrs. Shaler: "For the suggestion of the book and for most of the scientific material contained in it, I am indebted to my husband. In his opinion, the whole field of invalidism in its relation to intellectual and moral development deserves a consideration which it has not hitherto received. His personal acquaintance with many youths who start in the race of life with a burden of grave disabilities resting upon them made it plain to him that the sense of their handicap was a load that needed to be lightened. It seemed worth while, therefore, to prepare, with special reference to this class, a brief statement of the achievements of noted persons who, under the stress of grave difficulties, have shown skill in marshaling their physical and spiritual forces to play the part of men."

Other books on the list of Duffield & Co. are: "Molière, the Poet and Man," by H. C. Chatfield-Taylor; Brandes's "Reminiscences of My Childhood and Youth," translated by G. M. Fox-Davies; "The World's Painters Since Leonardo," by J. W. Pattison; "The Plays of Our Forefathers," by Charles Mills Gayley, and "China-town Ballads," by Wallace Irwin.

The *Geographical Journal* for August opens with an interesting account by Baron Erland Nordeskiöld of his archaeological and ethnographical researches among the Indians in the primeval forests on the boundaries of Bolivia and Peru, some of whom are as yet utterly untouched by civilization. They are now few in number, but the prevalence of ruins and especially of ancient burial places, in which were found many bronze and stone implements, showed that formerly the region was densely populated. Though forest dwellers and having no settled abode, they are agriculturalists and cultivate bananas, mandiocca, potatoes, cotton, sugar-cane, and maize. They are industrious, intelligent, and chaste, but, having a fatal propensity for liquor, they are becoming practically enslaved to the white rubber traders. Their condition differs but little from that of the Congo negroes, and the Baron says that unless the governments interfere and protect them from both fire-wa-

ter and the white man they are doomed to extinction. Prof. J. W. Gregory treats of the economic geography and development of Australia and says that because of the enormous deposits of coal and the high quality and wide distribution of its iron ores, he is confident that in the future—with the possible exception of China—she will beat the world's record in the production of iron. The geography of international boundaries is treated clearly and suggestively by Major E. H. Hills. He lays down the fundamental principles that the permanent frontier should be an actual barrier, clearly indicated, stable, and following existing ethnological or tribal boundaries. Then are described with illustrations from history the various types, as river, watershed, and artificial frontiers upon parallels of latitude, meridians, or a straight line, with the grave difficulties arising from them. The importance of the subject to Great Britain is shown by the fact that in Africa alone there are 5,000 miles of frontier common with France and 3,500 with Germany, much of which is unexplored territory, and therefore containing the germs of future misunderstandings. Lieut.-Col. Maunsell contributes some notes to accompany his valuable map of Eastern Turkey in Asia.

Much pleasanter reading than the recent accounts of slaughter in Joló is an episode related in the May number of the *Far Eastern Review* (Manila, P. I.), devoted to the Moro province. About two years ago the present district governor of Davao (Lieut. E. C. Bolton) received word that a mountain tribe of Bilanes had made a descent upon the Tagacaols, and had murdered two or three of the latter. [The peoples mentioned are non-Mohammedan hill-tribes.] The governor at once proceeded with one or two soldiers and fourteen Tagacaolos some fifty miles into the interior, and suddenly appeared before the house of the Bilan chief, who had never before seen a white man. His first remark to the district governor was, "You look just as I do," this Bilan chief having brown hair and eyes, and rather light complexion. To inquiries about the murders, the chief replied: "Yes, and we have forty-seven more to kill to get even for a raid they made upon our tribe some years ago." The governor explained that such reprisals could not be allowed, and invited the chief to a conference to be held at Santa Cruz, on the Gulf of Davao, on a certain date some few weeks ahead, which was carefully recorded by tying the proper number of knots on a string. The governor then visited other tribes engaged in vendetta warfare, and on the appointed day the conference was held. A judge was appointed from each tribe, with the governor as referee. Witnesses from five tribes went back over ten years of murders, thefts, etc. A remarkable fact was that, so far as could be determined, the witnesses all told the truth. A table was made showing the depredations of each tribe against the others, like a clearing house sheet, corresponding crimes were struck off, and a balance was left against two tribes which had committed more depredations than the others, which they agreed to settle by the payment of two hundred plates and three big gongs. They then shook hands all

around, and enjoyed the festivities arranged for them.

Arthur Symons publishes, in the *Athenaeum*, some curious discoveries made in the birth registers at St. James's, Westminster, while in search of dates connected with Blake. He found a William Marlow, son of Christopher and Mary, born March 2, 1709; Jane Marlow, daughter of Xopher and Barbara, born September 21, 1709; besides a Hannah Marlow, born 1748. "It is safe to assume," he says, "that in the year 1709 no name in English literature was more completely forgotten than that of Christopher Marlowe, and that no Marlowe, therefore, not connected with his family was likely to choose so uncommon a name as Christopher (which I found only a few times in the registers of fifty years). Yet, here are two fathers of families, at exactly the same time, both called Christopher Marlow." Not far off he discovered a Mary Ann Faust and a Hester Tamberline, besides a Mary Witchcraft and a Mary Ann Death.

"The Zambesi beyond the Victoria Falls" was the subject of one of the most attractive papers read before the British Association. The author, Mr. Trevor Batty, went up the river a hundred miles in native dug-outs into a region which, though traversed by Livingstone, had never before been visited by a naturalist. He found the natives highly intelligent, and said that it was not difficult to believe that their ancestors might have designed and built Zimbabwe, the finest of the Rhodesian ruins. This intelligence he illustrated by showing a perfectly symmetrical bowl not made upon a potter's wheel, but by the unaided fingers of a woman; beautifully finished ivory rings cut by primitive chisels and files out of the solid tusk of an elephant; fish spears with barbs almost as fine and quite as sharp as those of a trout fly fashioned out of iron, smelted from the clay iron-stone and forged and then cut when cold. Such work could only be made in England by high mechanical skill. The king, Lewanika, and his son, Litia, were intelligent men anxious for the improvement of their people. When the king returned from the Coronation, he was so impressed with the wonders of civilization that he began his opening speech to his people with the words, "You are simply baboons! Simply that!"

Carlo Tivaroni, whose exhaustive history of modern Italy has given him a permanent reputation, died at Venice on August 6. He was born at Zara in 1843. As a lad of seventeen he enlisted under Garibaldi in the Sicilian expedition, and again in 1866 and 1867 he obeyed that magician's call. He was a consistent democrat, who accepted, however, the monarchy as the indispensable symbol of Italian unity. He served one term as deputy from Belluno, but spent most of his life in the Department of Education, of which he became prefect. In 1882 he published his "Storia Critica de la Rivoluzione Francese." This forms, indirectly, an introduction to his monumental "Storia Critica del Risorgimento Italiano," which appeared in nine volumes between 1888 and 1897. The scale on which he worked was broad in generals and minute in particulars. He takes three volumes to bring the story down to 1815; three more for the years 1815-48, and a con-

cluding three for the actual achievement of unity and independence, 1849-70. He had the ideals of the most pedantic German "scientific" historians at their crudest, making his volumes a receptacle for an immense amount of miscellaneous matter thrown together without regard for form or for attracting the reader's interest. He uses no footnotes, but inserts titles and quotations parenthetically in the body of his text. And yet his nine volumes are unquestionably the most important record of Italy's regeneration, and they will long remain a quarry for students, although they can never be popular. They are in the main impartial. The fact that Tivaroni was a Mazzinian serves to give distinction to his opinions; indeed, the reader who cares to sample Tivaroni at his best cannot do better than to turn at once to his study of Mazzini. It is not too much to say that if all the original sources on Risorgimento history were lost, Tivaroni's *magnum opus* would enable the perspicacious historian to get a clear notion of that epic transaction.

The philologists of Germany, and particularly of Bavaria, have been celebrating lately the hundredth anniversary of the birth of one of the most creative, if least conspicuous, German scholars of the nineteenth century. On the fourteenth of last March, at the annual meeting of the Bavarian Academy of Sciences, a memorial address was delivered by Prof. Ernest Kuhn, son of the celebrated Adelbert Kuhn, on Johann Caspar Zeuss, the founder of Celtic philology. And on July twenty-second, an international meeting in commemoration of Zeuss was held at Bamberg, where he was professor of history during the last years of his life. The chief address at Bamberg was delivered by Prof. Kuno Meyer of Liverpool, one of the most eminent of living Celtic scholars and the organizer of the new School of Irish learning at Dublin. Professor Meyer also officially represented the Royal Irish Academy, and the Gaelic League, the great popular organization for the revival of the Irish language, sent a delegate who made an oration in Irish. M. Henri Gaidoz, wishing to offer a tribute on behalf of French scholarship, has reprinted and expanded an admirable account of the life and work of Zeuss which he published originally in the *Revue Celtique*, in 1885. His brochure (privately printed, Paris, 1906), contains also a reproduction of a portrait of Zeuss now in the possession of the Bavarian Academy of Sciences.

Zeuss received scanty recognition during his lifetime. He passed most of his days as a secondary school-teacher and obtained a university chair, after repeated denials of his application, only to be quickly compelled to relinquish it because of ill health. Now that the branch of science in which he was an isolated pioneer numbers its adherents in many universities of the old world and the new, it is a satisfaction to see some suitable tribute paid to his memory. There were Celticists, perhaps, before Zeuss, but hardly Celtic philologists. When the history of Celtic studies is written, due recognition will be given to the work of such native antiquaries as Edward Lhuys in the eighteenth century and O'Donovan and O'Curry in the early nineteenth. But the supreme debt of Celtic philology to the labor of Zeuss will always

be acknowledged. It has been playfully, but appropriately, expressed by Dr. Whitley Stokes in the quotation,

Zeüs árçhē. Zeüs méssa, Aós δ'ék pánta téttukai,

and seldom has a branch of learning owed more to one man. His early work, "Die Deutschen und Ihre Nachbarstämme" (which he was compelled to publish at his own expense) marked an epoch in the investigation of Germanic and Celtic ethnology, and his chief production, the "Grammatica Celtica" (1853), laid the foundations and raised much of the permanent superstructure of scientific Celtic grammar. During the fifty-three years that have elapsed since the publication of Zeuss's grammar, a small but ardent group of specialists have added vastly to the materials available for the study of the Celtic languages and literatures, and they have made many corrections in Zeuss's results. But they all gladly acknowledge their utter dependence on his initial labors, which give him an unquestioned place among the very few great masters of modern philology.

A curious intellectual phenomenon is the growing influence of John Henry Newman in France. It exists in a well-defined movement of certain minds toward Catholicism; in what may prove an answering movement among younger Catholics, with whom for the present it is an aid to their own belief; and, strange to say, in the general settling of ideas among others, quite apart from religion. The purely theological case of Abbé Loisy and his sympathizers is less known in France than in England and America, except, perhaps, among the clergy. But Brunetière has long been insisting on Newman's place in evolutionary philosophy; and Paul Bourget, when he first turned to his present sobriety of thought, published a striking study of the personality of the author of the "Apologia." Bourget now writes a significant preface to a fairly complete book on Newman, as he interests Frenchmen, by Georges Grappe. He draws attention to the coincidence, within a few weeks, of Newman's entrance into and Renan's exit from the Roman Catholic Church, and the consequences in the intellectual life of each. The historical relations of Newman's life are gone into very thoroughly by that grave and highly respectable, if not sparkling writer, M. Thureau-Dangin, who is also a member of the French Academy, in his "Renaissance du Catholicisme en Angleterre." Raoul Gout has studied Newman in the form of a bulky university thesis for the doctorate at the faculty of Protestant theology in Montauban. Lucie Félix-Faure (Madame Goyau), daughter of the late President, has made him the subject of one of her really superior popularizing volumes; and Ernest Dimnet is *le premier des newmaniens de France*. Abbé Henri Brémond, now the most promising French clerical writer, who, as an exiled Jesuit, gained experience in English colleges, publishes "Newman—Essai de Biographie Psychologique." And a member of the Pasteur Institut, professing at the Sorbonne, acknowledges reading the essay on Development for its suggestiveness.

One of the centenaries passed over this winter with little noise was the two hundredth anniversary of the death of John

Evelyn. Yet the event did not go entirely unregarded. A London publisher took the occasion to bring out a reprint of H. B. Wheatley's edition of the "Diary and Correspondence," and the work, in four stout volumes, has now reached us through the regular importer, Charles Scribner's Sons. Evelyn's "Diary" was first published in 1818, William Bray being the nominal editor, though much of the work of selecting and transcribing was done by William Upcott. The edition was not complete, yet Bray apologizes, not for omissions, but because "many things will be found in its pages which in the opinion of some, and not injudicious, critics may appear too unimportant to meet the public eye." That was in the days when the public still demanded respect. In 1879, H. B. Wheatley reedited the work, but, with the exception of a new life of Evelyn and a full bibliography of his works, could only reproduce the old and incomplete text. An appeal to Mr. W. J. Evelyn, the owner of the Evelyn property, for access to the original MS. brought a flat refusal. That gentleman wrote: "Colburn's third edition of the Diary was very correctly printed from the MS., and may be relied on as giving an accurate text." The present edition is a reprint of that of 1879, with, however, a number of fresh illustrations which add considerably to its value. Mr. Wheatley, to whom we owe the much-expanded Pepys, shows some indignation at the reserve of the present owner of the Evelyn MS. It is the natural feeling of an editor and the public will probably agree with him. But it is quite possible that Mr. Evelyn is justified in his action. Every case of this kind must be decided, not on a general rule, but on its particular merits. Undoubtedly the character of Pepys, a fairly solid man in his day, has suffered a certain distortion from the publication of records never meant to be seen any more than our own private thoughts are meant to be heard. Would the printing of Evelyn's "Diary" in full take off somewhat from the sober and dignified image of him we now possess? To his contemporaries, as to ourselves, he was the typical English gentleman of high character and broad culture; his representative to-day might well think twice before doing wrong to such a reputation by giving a false emphasis to his minor incongruities. We know what Pepys thought of his fellow diarist:

He read to me very much also of his discourse, he had been many years and now is about, about Guardenage; which will be a most noble and pleasant piece. He read me a play or two of his making, very good, but not as he conceits them, I think, to be. . . . In fine, a most excellent person he is, and must be allowed a little for a little conceitedness; but he may well be so, being a man so much above others.

Johnson may wear his mole in Sir Joshua's picture without detriment, but how might this "conceitedness" be thrown out of true proportion by the betrayal of a man's unguarded words. All this is, of course, mere conjecture on our part. At least we may welcome an old favorite in its new dress, although we might wish that the volumes were a trifle less bulky—and expensive (the price is \$12).

Beverly Warner's "Famous Introductions to Shakespeare's Plays by Notable Editors of the Eighteenth Century (Dodd, Mead & Co.) might well have been in-

spired by Prof. Nichol Smith's recent collection of the eighteenth century critics of Shakspeare, so nearly identical are the contents of the two. Morgann's admirable paper on Falstaff, which is the chief attraction of the latter, is absent from the former, as it does not fall exactly within the bounds of the title; and its place is supplied by one or two of the prefaces proper omitted by Professor Smith. Like the earlier editor, too, Dr. Warner has opened his volume with an introductory survey or estimate of the material. Under the circumstances it seems a little odd that he should not have referred to his predecessor, who has in a sense preëmpted the ground, and whom he ought, at least, to have known of. But the matter, as far as it is of any consequence at all, is one of literary courtesy rather than of literary ethics. At all events, with these points the resemblance ceases. Prof. Smith's book, though by no means inaccessible, is a foreign publication; and it is no doubt very proper that the home market should be supplied with native products. And besides there is one slight advantage which this new compilation possesses, though purchased at a considerable sacrifice. As it contains nothing but editors' prefaces and contains virtually all of these, it gives the historical student of literature an excellent opportunity to trace the gradual evolution of Shaksperian scholarship throughout the period, at the same time that by omitting two of the best general essays of the time—Morgann's, already mentioned, and Farmer's on the "Learning of Shakspeare"—it fails to give a fair idea of the criticism of the same century. As for Shaksperian scholarship, however, it is easy to trace a gradual narrowing of its interests from large and general questions of literature and life to that exclusive preoccupation with etymological and textual concerns which was finally to mark the editorship of the nineteenth century. The tendency is unnoticed by the general editor; but he points out judiciously enough the chief merits of the several prefaces, to which he has prefixed in every case a brief life of the author. On the whole, the make-up of the book leaves something to be desired. The matter is not very clearly distinguished for easy reference; the head-lines in particular give no clue to the separate pieces.

Charles Squire's "Mythology of the British Islands" (Blackie & Son) is frankly popular and unoriginal, written not for the Celtic scholar, but for the general reader, to supply him, in the words of the preface, with "a kind of handbook to a subject of growing importance—the so-called 'Celtic Renaissance.'" It aims, in short, to impart some such knowledge of Celtic mythology as most persons of cultivation are supposed to possess of the mythology of Greece and Rome, and so far as the substance of the ancient tales is concerned it accomplishes this purpose satisfactorily. The materials are well compiled, and the stories of gods and heroes are attractively told, often with close adherence to the Welsh and Irish narratives. The book will give a reader who is unacquainted with Celtic literature a good impression of some of its most characteristic features, and it ought to prove a sufficient guide to the mythological allusions in the Anglo-Celtic writers of the recent re-

vival. For the critical interpretation of the documents, however, and for mythological theory in general, Mr. Squire should be followed with caution. His specific errors are perhaps not numerous, though the derivation of "druid" from the same root as the Greek *δρῖς* may be cited as an example of an opinion now generally abandoned. His fault lies rather in the failure—particularly misleading to the uninformed reader—to distinguish with sufficient clearness between fact and theory. We are not sure how far he is himself aware of existing difference of opinion, but he appears to have relied too fully on the utterances of one or two scholars, and not to have read widely outside of them. He draws chiefly, to be sure, upon a scholar of undoubted authority, Professor Rhys of Oxford, and the doctrine he derives from him has become a kind of current orthodoxy. Nevertheless it should be more guardedly stated. Professor Rhys would be the first to admit the large conjectural element in his own theories, both ethnological and mythological. Yet from reading Mr. Squire's chapters on the Welsh and Irish divinities one would hardly suspect that the whole theory of a Celtic pantheon had in recent years been questioned by some of the best Continental scholars. While we agree in this matter rather with Professor Rhys than with his critics, we think that their ease should be stated, or at least their exceptions filed, even in a popular handbook of Celtic mythology.

James Hain Friswell, the essayist, critic, and novelist, was a familiar figure in the literary society of London thirty years ago. His most popular work, "The Gentle Life," a series of essays, "sold like a spelling-book for over thirty years" (to quote Besant). This minor classic was a favorite with the Queen, who wrote to Friswell that she wished his essays could be engraved "in letters of gold." It brought a fortune to his publishers, and to the author less than one hundred pounds. "The Gentle Life" served its turn long since, and has been superseded by other tonic works of the same type. Miss Friswell and her father knew everyone and went out everywhere, so that the reminiscences she now publishes, "In the Sixties and Seventies" (Herbert B. Turner & Co.) could hardly fail to be readable, though the fastidious may find too much autobiography, and nothing strikingly new about the famous men and women who are reviewed. In the present scarcity of personal gossip about Mr. Swinburne, the description of a tea party to which he was entrapped (at the age of twenty-nine) and certain other rather meagre anecdotes related by Miss Friswell will be welcome to many. The Friswells were intimate friends of Sir Richard and Lady Burton. The latter could talk of nothing but "dear Richard and the Government" and the strictness of her husband's private life, in spite of his "polygamous opinions." When Stanley was about to publish "How I Found Livingstone" his publishers sent the MS. to Friswell to revise. It was ungrammatical and ill-spelt, and Friswell handed it over to his daughter, who spent weeks in getting it into shape. All the proofs passed through her hands, and when the book came out "the critics were somewhat surprised at the

clear, concise style in which it was written." Miss Friswell, however, never met Stanley, and he did not know, or at any rate never recognized her share in his book, though his publishers paid her a hundred pounds. In her reminiscences one meets all the famous actors, writers, and artists who figure in the memoirs of that period, and some of the anecdotes which begin to show signs of wear. The contents are not quite worthy of the excellent paper and print of this handsome volume. They would have been more in place in a magazine. This is mainly because there is nothing whatever of political interest, and it is usually their politics that make English memoirs worth reading.

The Monnaie Theatre of Brussels has chosen two novelties for its next opera season: "Salome," by R. Strauss, and "Queen Vahsté," by Emile Matieu.

The Italian librettist Illica and the composer Louis Lombard, formerly of this country, have finished an opera which is to be produced next season.

The Société Musicale in Paris offers a series of prizes. The composer of the best opera will receive \$6,000; for a comic opera \$2,400 is offered; for a ballet \$1,600; for a trio for piano, violin, and cello, \$600; and for a sonata for piano and violin \$400.

During his long life of 101 years Manuel Garcia instructed many pupils who now reside in America. A memoir of the great teacher is being prepared by Mr. Sterling Mackinlay of London, who was for years a pupil of Garcia and who will be grateful for any information likely to be useful.

At the Leipzig Opera, during the past season, eighty-two different operettas and operas were heard. The great German composers were represented by sixty-five performances, of which Wagner had forty-four, Weber ten, Mozart eight, Beethoven three. First performances were given of "Salome," "Feanto Solo," "Wertber," "Enoch Arden," "Die Neugierigen Frauen."

Strauss's opera "Salome" had twenty performances in Dresden during the past season. Mozart's operas were heard twenty-four times, and Wagner is, as usual, far in the lead, with fifty-seven representations. Here, as in other German cities, the doors of the opera house would have to be closed but for the operas of Wagner, of which Mapleson used to say that they "spell ruin."

There still exist antique individuals who hold that the greatest opera composers of Italy and Germany did not know how to write for the voice. Giovanni Sbriglia, the singing teacher, is one of these. He is quoted in the *Étude* as saying that "with the advent of the music of Verdi and Wagner it was no longer necessary to sing, and the artists simply had to declaim over the accompaniment of a large orchestra, so that the beautiful nuances of singing, which were its chief beauty, were impossible for the singer."

It has often been noted that Wagner apparently got the anvil motive in the "Ring" from the scherzo of Schubert's D minor quartet. In volume v. of his "Life of Wagner," Mr. Ashton Ellis points out that Wagner was studying this quartet in connection with a performance of it at Zurich, at the time when he was leading his Wotan

down to Niebelheim. He also points out a resemblance between Mime's so-called "cringing" motive and another passage in the same quartet, which is very likely to be similarly accounted for.

A Viennese journalist, who visited the Johanneum museum in Graz the other day, came across an album which belonged to Anselm Hüttenbrenner. In this there was a lock of Beethoven's hair, and, in Schubert's handwriting, and signed by him, a sentence from Cicero's oration, "Pro Rabirio": "Exiguum nobis vitæ curriculum natura circumscriptit, immensum gloriæ" (Small is the space which nature has measured off for our life, but great the field of fame). At the time when Schubert wrote this he was helping his father teach school.

French critics are anything but pleased with the manner in which singing is taught at the Paris Conservatoire. They accuse the professors of teaching so stilted and unnatural a method that after a year no one but their instructors cares to hear them. In Germany, too, things have come to a sorry pass, according to Lilli Lehmann. The singers, after two years of study, expect to reap a rich harvest, the result being that, after singing a few big rôles, in which they have screamed themselves hoarse, they must resort to fresh-air sanatoriums and throat specialists.

The lion of the past musical season in London was Edvard Grieg, and efforts are being made to have him repeat his visit in the autumn. On his return from London to Copenhagen he was interviewed by a representative of the *Vort Land*, to whom he expressed his regret that in the last few years he had been unable to compose, especially in the larger forms. Ill-health alone had prevented him from completing a quartet and a trio. Once started on a work, Grieg's habit is to finish it at once, and to protect him from the strain which this implies, his medical advisers insisted on his abandoning composition entirely.

A well-known painting by Raphael—the "Madonna of the Tower"—has been presented to the National Gallery, London, by Miss Mackintosh. Since 1856 the picture has been in the possession of the Mackintosh family, having been bought by Mr. R. J. Mackintosh for 480 guineas from the collection of the poet Rogers, who looked upon it as one of his chief treasures. Although the painting had previously formed part of the Orleans collection, it has always been best known as the Rogers Madonna. Crowe & Cavalcaselle write of it: "To the Rogers 'Madonna' we turn as to a lost example of the master. . . . Our memory still clings to this masterpiece as embodying the feelings and tenderness of the Florentine period manifested in the 'Madonna del Gran Duca,' and the 'Virgin of Casa Tempi,' combined with the dignity and elevation that characterize the later 'Madonna del Pesce.'" This "lost example"—lost to the public since 1857—has now come into the possession of the country through the generosity of Miss Mackintosh. It is an example, however, that will appeal more to artists and critics than to the general public, on account of its injured condition. It had the misfortune to fall into the hands of an ignorant restorer, a long time ago, and was clumsily over-cleaned, with the

result that the outlines have lost their sharpness and the details are blurred. As to whether the picture was originally painted on wood or on canvas, there is a difference of opinion; the Orleans gallery catalogue describes it as "peint sur toile," while Crowe and Cavalcaselle believe that it was originally painted on wood and afterwards transferred to canvas. But as marks of the canvas are clearly visible through the paint it would seem as if the Orleans opinion were the correct one. Critics have also differed with regard to the superb cartoon of this picture, purchased a few years ago by the British Museum; the majority think it to be an original work of Raphael, Mr. Berenson standing almost alone in holding the opposite opinion.

TEXT BOOKS.

Mr. R. L. A. Du Pontet, the editor of Cæsar's "Commentaries" in the series of Oxford Classics, has prepared for use in schools, "Selections from Plutarch's Life of Cæsar" (Oxford: Clarendon Press). This attractively printed edition is intended for beginners in Greek who are reading at the same time Cæsar's "Gallic War" and Shakspeare's play. It impresses us as somewhat too difficult for first-year work in Greek, but might well be used in the second year, as a substitute for part of the "Anabasis." We sometimes wonder at educators who regard the "Gallic War" as a dull book; properly presented, with Plutarch and Shakspeare to follow, it ought to mark an epoch in the schoolboy's career. The Clarendon Press issues also an anonymous edition of Plutarch's "Coriolanus," with fairly elaborate notes and a brief and sensible introduction. The book might find a place somewhere in the college curriculum, and has independent value, besides, since annotated editions of Plutarch, compared with translations of his "Lives," are rare.

Of importance for both the classical student and the student of Shakspeare is an edition of Plutarch's "Lives of Coriolanus, Cæsar, Brutus, and Antonius," in the translation of Sir Thomas North, by R. H. Carr. This work, too, comes from the Clarendon Press, printed on poorer paper than we should expect. The volume is designed as an introduction to the complete "Lives" of Plutarch in North's version, which will present for the first time the text of North accompanied by appropriate citation of Shakspeare. The editor conveniently divides Shakspeare's borrowings into two classes, giving mere references to passages which coincide with North in subject matter, but quoting fully those in which his actual language is reproduced. An introduction discusses the translations of North and Amyot and the plays of Shakspeare most intimately related to the "Lives" of Plutarch included in the present volume.

In the Gildersleeve-Lodge Latin Series, J. E. Barss's "Beginning Latin" has recently appeared (University Publishing Company). Mr. Barss would solve the initial problem in the teaching of elementary Latin by building paradigms—presenting together case forms of several declensions, present tenses of all the conjugations, and so on. We do not sympathize with him in this programme, nor in the attempt to

bridge the gap between the first-year book and Cæsar by serving up the latter in a simplified, that is, diluted, form. The book has its good features, however, including well-chosen illustrations and a wide range of subjects in the reading exercises. The Beginner's Book must teach grammar, primarily, and prepare for Cæsar, but it should give the learner, besides, as many glimpses as possible of Roman life.

The latest publications in the series of Greek text books edited under the supervision of Professor Smyth of Harvard (American Book Company) are two scholarly and attractive editions, the one of eight speeches of Lysias, by Prof. C. D. Adams, the other of Thucydides, Books II. and III., by Prof. W. A. Lamberton. The first of these is a welcome supplement to Professor Morgan's excellent edition of Lysias, which presents a somewhat different selection. The new Thucydides, too, while not including the favorite seventh book, brings for the first time within the range of effective classroom work perhaps the highest utterance in all Thucydides—Pericles's Funeral Oration. Another volume in the same series is a helpful "Greek Prose Composition," by C. W. Gleason, intended to accompany the reading of Xenophon's "Anabasis." A more advanced work for use in high schools, issued by the same publishers, is "Elementary Latin Writing," by Clara B. Jordan. We are glad to note in this and other recent text-books in Latin composition a tendency to react from the method of basing exercises on some text, and to train the student from the start to more independent work. The American Book Company has also published in the Morris and Morgan Latin Series, two editions which make a feature of presenting by selections an idea of the whole contents of an author's work or works which are too long for a single volume. While not in sympathy with such a programme, we must acknowledge that, granting its necessity, it is skilfully carried out in the two books before us: "Selections from Livy," by Prof. H. E. Burton, and—an admirable edition—"Cæsar, Episodes from the Gallic and the Civil Wars," by Dr. M. W. Mather.

A pathetic interest attaches to the most recent publication in the *Cornell Studies in Classical Philology* No. XVII, (Macmillan)—a volume entitled "Erichthonius and the Three Daughters of Cecrops," by the late Benjamin Powell. Mr. Powell died a few days before the commencement at which he would have received the degree of Ph.D. from Cornell University, and this is his dissertation. Though not brilliantly original in treatment, and written in an ungainly style too often characteristic of doctors' dissertations, the work has a value. The author considers the source of the legends of Erichthonius in both literature and art, reviewing the interpretation of various modern scholars, and retelling the history of the legends on the basis of the available evidence. In an appendix, he prints *in extenso* the passages cited from ancient authors, and adds a dozen plates illustrating the appearance of the legends in art. He acknowledges special indebtedness to the researches of Miss Harrison, and differs from her chiefly in assuming some Oriental influence on the legend of Erichthonius at an early stage of its history, and in regarding the symbolism of

the snake as primarily sexual. For evidence on the former point, undue attention is paid to a dangerous guide, Robert Brown's "Semitic Influence on Greek Mythology." Several errors in detail call for comment. One of the authors used as a literary source (p. 6) is "Eudocia, the Byzantine writer, in her *Violarium*," whereas it has been known for several decades that the work in question is a compilation of the sixteenth century. Reference is given (p. 5) to the "Narrationes Fabularum" of "Lactantius Placidus, the Scholiast," who is accused of "mixing narratives" and "either writing from memory or from a distorted version of the original story." But any history of Roman literature contains the information that "Lactantius Placidus" is an anonymous prose epitome of Ovid's "Metamorphoses." These are not serious errors, it happens, but we should not expect them in a doctor's dissertation.

Prompted by Prof. Calvin Thomas, Dr. Annina Periam has prepared "Hebbel's Nibelungen: Its Sources, Method, and Style" (The Macmillan Co.). Only recently has Hebbel had admirers and appreciative critics, his "Nibelungen" being one of the few dramatic versions of the saga which has found favor on the stage. Dr. Periam tells of its genesis, Hebbel's conception of his dramatic problem, the legendary sources, Hebbel's relation to Raupach, Fouqué, Geibel, Wagner, and Vischer, his inventions, treatment of woman and religion, and the elements of the mythical and mystical in his work. A bibliography concludes the volume.

The long-established reputation of D. C. Heath & Co. for modern language textbooks is well sustained in their "Deutsches Liederbuch," the best collection of German songs, with music, ever issued in America. The editors are Prof. A. R. Hohlfeld and a committee of the Germanic Society of the University of Wisconsin. The songs are arranged for various voices, and there are introductory notes in German and a biographical index. The same firm has lately issued "Deutsche Reden," including speeches by Bismarck, Bülow, Moltke, Schurz, and Emperor William II., edited by Dr. Rudolf Tombo, Sr., and his son, Professor Tombo, of Columbia.

Probably one of the most enthusiastic students of Heine in America to-day is Carl Edgar Eggert, of the University of Michigan, who has been known to be at work on "Heine's Poems." The volume lies before us (Ginn & Co.), beautiful in fresh typography and containing an autographic portrait. There is a long biographical sketch of Heine, with especial reference to his days in Paris, an analysis of his character and attitude toward religion, and a discussion of his relation to Romanticism. Heine's position in music is also made clear, and there is an extensive bibliography.

A new edition, especially for library reference, of Schiller's "Song of the Bell," translated metrically and accompanied by an historical introduction, a commentary on other translations and a complete bibliography, by Dr. J. Perry Worden, professor of modern languages in Kalamazoo College, is announced from Germany. Besides being a new and closer rendering of the original, the special merit of this first

book ever written on Schiller's most famous poem is a series of illustrations, the largest collection heretofore given in one volume.

An acceptable edition of Ernst von Wildenbruch's "Das edle Blut" has just been published by Holt—the first American edition of the little classic which has passed its sixty thousand copies in Germany. There are notes, vocabulary and prose exercises by Ashley K. Hardy of Dartmouth, and a portrait of the fiery dramatist.

Another writer all too little known in our curricula is Gustav Frenssen, who finds representation at last in "Gravelotte" (chapter xiv. of "Jörn Uhl"), at the hands of Prof. Otto Heller of Washington University (Ginn & Co.).

"Aus dem Leben eines Taugenichts," the most popular of Freiherr von Eichendorff's writings, is such delightful autobiography in the lyrical-prose vein, without really reflecting Eichendorff's ideal of life, that still another edition by Dr. George M. Howe of Cornell will be welcomed. (Henry Holt & Co.)

A new contribution to class-room literature, designed to promote conversation and a knowledge of German life, is Thiergen's "Am deutschen Herde," edited by Prof. S. W. Cutting of Chicago (Ginn & Co.). The authors are Dresdeners. An imaginary journey is taken, beginning at New York; Berlin, Dresden, and other cities are visited; the theatre and opera are seen and the tourists pass through all sorts of experiences, even enjoying a Bierkneipe and seeing a duel!

Silver, Burdett & Co. will publish in a few days "Through France and the French Syntax," a composition book on original lines by Prof. Robert L. Sanderson of Yale, and "A Scientific French Reader," by Prof. Harold Francis Dike of the Massachusetts Institute of Technology.

Among the new French texts of the season, issued by D. C. Heath & Co., are a well-annotated edition of Labiche's "La Grammaire" from the pen of Prof. Moritz Levi of Michigan; La Bruyère's "Les Caractères" from Prof. F. M. Warren of Yale, and Taine's "L'Ancien Régime," from Prof. W. F. Giese of Wisconsin. There is also a curious "Méthode Rénin" or first-year French in French, dedicated to Ambassador Jules Jusserand.

The latest French text from Henry Holt & Co. is an edition of Molière's "Tartuffe ou l'Imposteur." Dr. John E. Matzke of Leland Stanford Jr. University, the editor, supplies a good introduction on the origin, spirit, history, and sources of the play, besides discussing the characters in detail. A bibliography adds to the work.

La Fontaine's fables, scattered here and there in French readers, have always proven so readable that Prof. O. B. Super of Dickinson College has been wise in editing "One Hundred Fables" by the same author. (Portrait. Ginn & Co.)

Those who have sought to acquire an acquaintance at first hand with the ancient lyric of Southern France will admit that they have encountered peculiar obstacles in the complex phonological and morphological conditions of the language. To remove these obstacles by bringing order out of a bewildering array of linguistic facts was the task which Professor Grandgent set himself, and it is

simple justice to say that he has achieved it in his admirably compact and lucid grammar, "An Outline of the Phonology and Morphology of Old Provençal" (D. C. Heath & Co.). Being a competent phonetician in the domain of Romance philology, he has been able to explain satisfactorily, in the vast majority of cases, the course of sound change in the development from the Latin word to the form assumed in the conglomerate of dialects in which the poetry of the Troubadours is preserved to us. In this respect, no less than in his full and luminous statement of the morphology of the language, his book marks a decided advance upon the works of Suchter and others.

"The Romances of Chivalry in Italian Verse," compiled by Prof. J. D. M. Ford, of Harvard, and Miss M. A. Ford, is the best volume of specimens of the Italian epics for English readers. The selections have been made with such excellent judgment that by them one can trace (1) the development of the romantic epic as a literary genre; (2) the growth of the Orlando story; (3) the characteristic qualities of Pulci, Bolardo, Berni, Ariosto, and Tasso. There are also fragments of the early "Orlando" and of the "Libro Volgar." Out of about 500 pages of text 225 pages are devoted to the "Orlando Furioso," not a disproportionate share, in view of the superior interest of his epic. The importance of the Italian epic itself, as a high literary product, has never been sufficiently recognized by English-speaking students. Perhaps Professor Ford would have done well, in his introduction, to call more attention to its serviceableness as a vehicle not only for varied narrative, but for satire. Pulci's "Morgante," for instance, serves as a powerful satire on the Roman Church, although Pulci, like Rabelais a generation later, compounded his sarcasm with a farrago of other material. Copious notes and a bibliography add to the usefulness of this well-conceived compilation. (Holt & Co.)

"Comedia Famosa del Esclavo del Demonio compuesta por el doctor Mira de Mesqua," edited with an Introduction and Notes, by M. A. Buchanan, Baltimore. This is a welcome edition of a work by Mira de Amescua, a Spanish playwright of the midpoint of the *siglo de oro*, whose excellence has only in recent times received proper recognition from the historians of literature. In his text Mr. Buchanan follows an edition of Barcelona, 1612 (probably not the first edition), of which a unique copy is preserved in the National Library at Madrid; he has, however, adopted emendations from later editions. His introduction discusses the affiliations of the various editions now discoverable, and examines the hagiology and the different legendary sources of the subject matter of the drama. Because of its connection with the Theophilus, the St. Cyprian, the Faust, and other legends of compacts with the Devil, the Spanish piece merits the attention of the student of the comparative history of literature.

On the basis of his own critical edition of Berceo's "Santo Domingo," already published in the series of the "Bibliothèque de l'École des Hautes Études" at Paris, Dr. J. D. Fitz-Gerald now makes a study of the underlying principles of the verse struc-

ture known as the *cuaderna vía*, an early Spanish arrangement in quatrains of the Alexandrine borrowed from France ("Versification of the Cuaderna vía as found in Berceo's 'Vida de Santo Domingo de Silos.'") The Columbia University Press). His treatise throws light on several metrical problems which, despite the efforts of Baist, Cornu, and Hanssen, have not been settled hitherto. The account which he gives of the possibilities in the way of synalæpha, dialysis, and synzesis is highly commendable, and his recapitulation of the discussion regarding the accent and syllabic value of the diphthong *ie*—a matter but lately agitated by Zauner and Pietsch—is valuable to all engaged in the study of Old Spanish.

The Spanish form of the framework of tales known as the "Seven Sages" (or "Sindibad") is a translation from the Arabic, made about the middle of the thirteenth century by direction of Don Fadrique, brother of King Alfonso el Sabio. It is therefore one of the oldest monuments of Spanish prose, and highly deserving of a good critical edition. In 1869 the eminent folklorist, Comparetti, who has devoted no little attention to the history of the Sindibad legend, published the text in the Appendix to his "Ricerche intorno al Libro di Sindibad." His edition was reproduced by the Folklore Society at London in 1882. Unfortunately, the copy of the Puñonrostro MS. which Comparetti used was imperfectly made, and his text presents many blemishes. On this account, A. Bonilla y San Martín now offers a new edition, which is based directly on the MS., and which appears as Volume XIV. of Foulché-Delbosc's "Bibliotheca Hispanica" ("Libro de los Engaños and los Asayamientos de las Mujeres"). In the main Bonilla has done his task well, yet a comparison with the facsimile of folio 73 recto, which he has prefaced to his text, shows that he has lapsed into a common error of Spanish editors of Old Spanish works, that of failing to distinguish between the *z* and the short cursive *s*; *desir*, *fisiestes*, *fiusa*, etc., have no historical justification, and a mere glance at the facsimile makes it clear that the MS. has *z* in all such cases. Nor is it obvious why, in the title, *asayamientos* is allowed but a single intervocalic *s*, for the Old Spanish spelling was certainly with *ss*. Happily, errors of the kind indicated are not numerous in the edition. In one or two places the text seems to show a lack of sense, due to syntactical irregularities; in the absence of any remark by Bonilla it is to be presumed that the MS. is also at fault. The introduction contains the main facts relative to the sources and the diffusion of the story of the "Seven Sages." The brief Glossary, in spite of a few errors, will be found of material assistance.

The rarity of the chrestomathy of Old Portuguese published twenty-five years ago by Monaci and D'Ovidio has been a source of regret in institutions in which it has been possible to extend Romance studies as far as that language and literature. Now the difficulty of obtaining a suitable manual has been removed by the publication of a selection of early texts by Leite de Vasconcellos, favorably known to Romance philologists as a folklorist and dialectologist,

and as editor of the *Revista Lusitana* ("Textos arcaicos para uso da aula de philologia portuguesa"). The extracts here printed are intended to illustrate the growth of the Portuguese language from its origins down into the sixteenth century. They begin with a few Latin deeds of gift and other legal documents in which stray words of the already emerging vernacular show themselves as early as the ninth century. For the later periods the editor has chosen lyrics found in the song books, such as the "Cancioneiro da Ajuda," the "Cancioneiro do Vaticano," and the "Cancioneiro Colocci-Brancuti." Certain of these poems have already been printed by Professor Lang of Yale in his "Liederbuch des König Denis," and in his "Cancioneiro Gallego-Castelhana," and of Lang's labors Leite de Vasconcellos makes suitable use. For the prose texts he has had recourse largely to important historical works, especially to those contained in the "Portugalia Monumenta Historica"; but the "Leal conselheiro" of Dom Duarte and the "Demanda do Santo Graal" are also represented by brief passages. The latest extract in the book is from the "Auto da Feira" of Gil Vicente. A useful glossary of the more difficult archaic terms closes this timely addition to the number of our Romance manuals.

THOMAS HODGSKIN THE PRECURSOR OF ANARCHISM.

Thomas Hodgskin (1787-1869). Par Elie Halévy. Paris: Société Nouvelle de Librairie et d'Édition.

Who was Thomas Hodgskin?

Probably not one in a hundred of our readers can answer this inquiry. Even the omniscience of the "Dictionary of National Biography" fails to supply the information. Thomas Hodgskin is, in truth, a writer who, though he lived for some eighty-two years, and during fifty labored for the propagation of beliefs which since his time have exercised marked influence, yet was, ten years before his death, forgotten by the men among whom he lived. Nevertheless, he deserves the sort of literary revival which he has received at the hands of Halévy. His claim to reputation consists in this: that his doctrines curiously link the teaching of Bentham with the beliefs of a school in many points opposed to Benthamism, and that, though an author whose works were read by few, and a lecturer who rarely obtained large audiences, he was in some sort the intellectual precursor of modern anarchism.

None but a too ardent admirer will call Hodgskin in strictness original, but he possessed that kind of second-hand originality—if an expression bordering on a bull may be allowed—which a man may attain by following out his own thoughts, whatever their worth, without being overpowered by the authority of received teachers. Hodgskin was guided by two or three convictions which, to use an expression of his own, might be described as "prejudices," if that word be used without any bad connotation. A letter to Francis Place, who encouraged the early steps of Hodgskin's career and introduced him to the utilitarian school, explains the nature of the prejudices on which Hodgskin built up a system of social re-

form. The existing state of society was in his eyes essentially bad, for every man ought to have the wealth produced by his labor; but whilst, according to Hodgskin, all wealth was in reality produced by the working classes, such wealth was in fact almost wholly in the hands of the capitalists or the rich, who were neither directly nor indirectly its producers. The laws of nature, in the second place, if properly understood and followed, were, he was convinced, sufficient to insure the rule of justice and the prosperity of all men, who were not only equal in capacity, but essentially similar to one another. Hence, he further drew the conclusions that there was no limit opposed by nature to human progress and that such progress could be promoted only by the most unlimited extension of individual freedom.

Now if this creed be taken as a whole it is to a certain extent in harmony with, yet at bottom fundamentally opposed to, Benthamism. Hodgskin, with the Benthamites, held that the condition of England stood in need of radical reform. In common with the utilitarians of, say, 1825, he fully believed that reform meant the promotion of individual freedom. No one could subscribe more *ex animo*, to borrow an expression from the history of theological subscription, to the doctrine of *laissez faire*. One's first impression therefore is that Hodgskin was nothing but an individualist whose individualism outran that of Bentham. As a matter of fact, throughout life he fell in, heart and soul, with most of the practical reforms advocated by utilitarians. He was in favor of every restraint placed on the power of Government. He was to his dying day an ardent free-trader. He believed that unlimited competition was the very source of human welfare. He uses expressions which at times almost anticipate the theory of the survival of the fittest. He not only looks, with John Mill, unfavorably on every attempt to influence the course of opinion by Governmental authority, but objects to the Government in any way dealing with national education. But his essential differences from the teachers whose ideas ruled England from 1830 to 1865 could not permanently be concealed. There came a period when no Benthamite could recognize Hodgskin as a coreligionist. He held with Bentham that the laws of England needed reform. But he did not, like Bentham, aim at substituting good laws for bad laws. He advocated measures through which laws themselves should disappear. For to Hodgskin it was not bad laws, but the existence of law, it was not bad government but the existence of government which caused all evils that torment mankind. Hence Hodgskin detested or despised the economical or social teachers to whom Benthamites paid the highest honor. The doctrines of Ricardo and especially his celebrated theory of rent were fallacies constructed in support of that existing state of society which reformers ought to destroy. Malthus taught not the truth but the exact opposite of the truth. For the increase of population was itself the cause of ever increasing prosperity. Malthus, moreover—and this to Hodgskin was his sufficient condemnation—inculcated the idea that nature herself had placed a limit upon the development of human happiness and welfare. Hence Hodgskin, in common with

all the later assailants of Benthamism, turned to the historical method and to the comparative study of society. Nor can any one doubt that in his attempt to argue from historical experience, and in the importance he attached to the comparison of different social conditions, he did anticipate ideas to which the Benthamites were more or less blind. He was in very truth the precursor of anarchism.

How has it come to pass that such a man died forgotten, and that his life's labor missed its mark? This inquiry admits of a distinct answer. Hodgskin was endowed with more than ordinary talent, and with rare tenacity of purpose, but he lacked the capacity, easy to recognize but hard to define, for taking a grip upon his generation. In this he was far inferior, not only to a theorist of original genius, such as Bentham, but even to that singular combination of a dexterous wire-puller and a utilitarian fanatic, Francis Place. The Benthamite tailor was a real power, at any rate in Westminster. Hodgskin had no gift whatever for controlling or guiding the wills of his neighbors. Then, too, the time was unfavorable for his teaching. Between 1830 and 1870 neither English thinkers nor English politicians felt any deep hostility to the ideas which underlie the social condition of England. The world needed not a revolutionist, but a reformer, and Bentham was the ideal reformer. His aims were perfectly clear and they were aims with which the middle classes, and to a great extent the wage-earners, sympathized. He had, moreover, thought out the means by which his ends might be attained. Hodgskin was in some respects a capable critic of utilitarianism. He perceived, for instance, in common with John Austin, that the Benthamites attached too much importance to mere changes in the constitution, and he knew that social evils might be mitigated, but would not be removed, by the transference of political authority from one class to another. But, then, the faith in the benefit to be obtained from constitutional changes was the faith of the day, and the prophet who attacked this creed was not likely to obtain converts. Reactionists indeed, such as Carlyle, who led the crusade against individualism, shared to a certain extent Hodgskin's conviction that even democratic changes would not cure maladies arising from a vicious state of society. But teachers who desired the rule of a despotic hero were even more opposed to Hodgskin than were the utilitarians.

But even had the times been more propitious, Hodgskin's career was from the first predestined to failure. He thought for himself, but he thought wrong. He anticipated ideas, many of them false, which have more power in England at the beginning of the twentieth than they had in the middle of the nineteenth century. He suffered, in common with many rash and half-educated theorists, under a fatal defect: he lacked eye for actual facts, or, in plain terms, that element of common sense without which even a revolutionary thinker can hardly, in England, at least, make his ideas tell upon the world. There are undoubted objections to be brought against Malthusianism; they have been strongly urged by so orthodox an economist as, for example, W. R. Greg. But

Hodgskin was an ineffective critic of Malthusianism because he assailed, not its possible weakness, but its certain strength. He seems to have denied that increase of population could in itself be other than a blessing, and absurdly enough thought he was confuting Malthus when he insisted upon the way in which the pressure of population might increase the inventiveness of mankind. He in reality, though not in form, accused Malthus of overlooking the effect of that struggle for existence whereof Malthus might in a certain sense be called the discoverer. Hodgskin again anticipated some of the criticisms which, whatever their worth, have been passed by later and abler writers on Ricardo's theory of rent. But he also appears to have held that no inferences worthy of consideration could be drawn from the undoubted facts that the earth is of limited size, and that the time would come when, all the most fertile parts being under cultivation, the unfertile remainder would produce less and less in proportion to the labor expended upon it. When at last our prophet proclaimed that the way to deal with crime was to establish perfect individual freedom, and thus somehow put an end to the production of criminals, practical reformers felt that they must part company with a former ally who had himself bidden farewell to common sense.

RECENT FICTION.

The Tides of Barnegat. By F. Hopkinson Smith. New York: Charles Scribner's Sons.

The King's Rerake. By Margaret L. Woods. New York: E. P. Dutton & Co.

Anthony Overman. By Miriam Michelson. New York: Doubleday, Page & Co.

Mr. Hopkinson Smith has a touch of his own in relation to matters of the coast. There is a beauty of coloring in his beaches, a dash and swirl in his waves, a ruggedness in his life-saving stations, a rough tenderness in his sea folk that bear witness to a sympathy made up equally of æsthetic perceptions and technical familiarity. In his new novel these well-known characteristics are fully evident, grouped upon a background new in many ways. Old seadogs he has given us in great variety of pose and in many phases of trouble, yet here is another Capt. Holt—this time with a wayward son—towering over the scene, and in the end clearing the much-clouded air. The vigorous group of life-savers, if familiar down to their tarpaulins, find work to do that is of a fresh interest. Though there are a saintly girl and an executive doctor as principals, and several neat land portraits in miniature, yet the figures are never quite so welcome as when salted. This gives a thrill to the rescue by the crew; this its charm to the boys' game of pirates on the hull of the stranded sloop. In such scenes Mr. Smith's touch is absolutely firm and workmanlike. In the parts that go to make a novel with a plot and a problem there is less of conviction. He seems to have sent his story ashore with its sea legs on, to lurch about among the conventionalities of fiction. Capt. Holt, for instance, who goes roaring down to the beach to find his son and make him marry

the girl he has wronged, would certainly not have given up so tamely. If we understand the old salt (and it is entirely the author's fault if we do), bread and water or handcuffs would surely have been the captain's mildest arguments. And again, Jane's long self-sacrifice for her sister—a mischievous one as she finally sees—is indeterminate because it is never made quite clear how far she suffers in public opinion. The story goes wider and deeper than any of its predecessors; if with less perfection of construction than the short stories, it is the most ripe of the novels.

"The King's Rerake" combines some of the most agreeable features of novels of various schools. That is to say, it is a story of adventure with almost no bloodshed, of historical episode and manners without affront to history; and, while not chiefly a love story, it contains a love passage of unusual grace. The Irish soldier fighting for Spain is a tempting subject. His capers never show to more brilliant advantage than when projected against the gloomy state and glittering rigidity of the Spain of fiction. And no happier species of a happy genus could have been culled than the episode of Patrick Dillon's expedition into France to rescue and restore Ferdinand VII., imprisoned in the country home of Talleyrand by Napoleon while brother Joseph Bonaparte rocked upon the Spanish throne. The story opens heavily and the reader expects a conventional and elaborated work—like Bunthorne's Jane, not pretty, but massive. But as the plot thickens the touch lightens. Patricio and his young matron friend, Luz, give themselves and their treasure to the restoration, with a fervor of loyalty like nothing so much as the Jacobite passion. The schemes and devices and allies of their invoking are immensely entangling and for the most part unhackneyed. If the narrative paragraphs move ponderously, honorable amends are made in the ingenious conversation. Bourbon sensitiveness might be wounded by the portrait of Ferdinand the Desired, and objectors to toying with history may raise the eyebrow at the close-range picture of Talleyrand. But of such is the *omelette à l'histoire*.

The community, the editorial office, labor, capital, the reformer, the journalist, the "essentially feminine" woman, the doctor, the striker, the scab—is there one word here to hold the tiniest promise of freshness? Yet this is the inventory of the chief contents of "Anthony Overman," one of the most original of recent novels. Other heroes have given themselves over to altruism and to "idealistic schemes" that promise "wholesale redemption from earthly misery"; other heroines, God wot, have sprained their ankles on mountain roads; other journalists striven high and low for copy; other laborers struck. But there is a force in Miss Michelson's book that sets it in a niche of its own. Its characteristic is a determination to see things as they are. The point of view is saliently modern, not boastfully so; felt naturally, not thrust out as a rock of offence. The hero is a renaissance Daniel Deronda, with a modern as well as a racial difference; the heroine a "yellow woman journalist." Such elements must needs strike fire when they meet, and the story deals with their inter-action and final assimilation—say, rather reconciliation—since it is not easy to see

that there was any more community of creed at the end than at first, and speculation wonders what came of it afterwards. The way of the altruist is to talk pages about himself, and Anthony is no exception; but he is a fine embodiment of the passion for doing good and of the suffering over others' pain.

A History of English Prosody. By George Saintsbury. Volume I., from the Origins to Spenser. New York: The Macmillan Co. \$2.50.

If the history of writings on English metrics, of English prosodism, so to express it, could be set forth as a drama and the qualities of the writers presented as the persons of the play, this hook would mark the appearance of a new character and the stage-direction would be: "Enter Commonsense." The development of the subject might be more continuous, the arrangement of the material might be improved, much parenthetic matter might be omitted, but altogether what strikes one is the sensibility of the book as a whole. Not merely for enthusiasts on metrics, but for students of literature in general, it is a good augury toward the probable clearing up of this entire blurred and cloudy subject to find Omond's mild fairness and Thomson's telling simplicity followed so soon by this all-pervading common sense. It not only reveals itself in such utterances as "Attention to prosody never harmed or spoiled attention to poetry, except in those made unpoetical from the beginning"; and "One has, while admitting the great stimulating effect of music, to hint or rehint a doubt whether, by itself, it can do much for prosody save suggest"; and again, "You may call a thing an octosyllable or an iambic dimeter or a four-beat verse, but the thing is the same and unmistakable." Mr. Saintsbury leaves it for others to discuss the nature and the basis of English rhythms; he wastes no time in expounding how this and that come to be true, he assumes them true and proceeds. Yet, even in the act of ridding himself of those questions which he regards as "previous" to his investigation, he lets fall fruitful opinions, such as, "In English, accent is a cause of quantity, but not the only cause, and not a stable one." Belief in "the humble virtue of sticking to the facts," the conception that "the Rule comes from the Work, not the Work from the Rule," make themselves felt throughout.

By "English Prosody" Mr. Saintsbury means that of English poetry since 1300. He makes plain his conception of its various origins and of their several contributions to the total result. He says, "Some of the most serious errors which have ever crept into the discussion of English prosody have come from a too obstinate determination to serve that prosody heir, at all costs and at all points, to Anglo-Saxon"; and "The differences of English verse of 1000 and English verse of 1300 are differences of nature and kind; the differences of English verse in 1300 and 1900 are mere differences of practice and accomplishment." On these points he will leave extremists unconvinced, but will appeal to all open-minded readers. Entirely logical is his treatment of his

main task as historian. He is very likely wrong in assuming less difference than phoneticians contend for between Chaucer's pronunciation and Spenser's. Spenser may not have the dominating importance as a metrist which is attributed to him. But without categorical proof Mr. Saintsbury's views on these and other points in the historic sequence of translations are made to appear entirely reasonable.

A history of prosody should be viewed not only as a history but as a contribution to the theory of metrics, and Mr. Saintsbury's contributions, with the reservations noted above, are certainly very considerable. He sets down, in big and black print, definite statements of the main laws of English versification as he conceives them. It is not hedging when he gives the caution: "In order to appreciate the theory of Feet which governs this hook, it is necessary to recognize that the writer does not maintain that they were invariably, or even for the most part, present as such to the mind of the poet. They may have had a potential rather than an actual value: he may have scanned lines not as we scan them, yet in such a way as to justify our scansion." This theory of feet he affirms most explicitly: thus (page 63) "The norm of the line is always a certain number of feet," and "Though the constitution or arrangement of these feet may be uniform, the greatest melody is reached by variation of them." Nor is he absolutely consistent. He expressly states (pp. 48, 49) "English tetrasyllabic feet do not exist at all," and again (page 400) reaffirms this. Some will consider too loose, others too strict, his views on monosyllabic feet in English, for while he admits their existence he limits their occurrence. As to trisyllabic feet he has no doubts. He not only recognizes them as the base of a separate kind of rhythm, but affirms their general, ubiquitous and continual substitution for disyllabic feet in disyllabic rhythms. He anathematizes "the obstinate heresy, finally formulated as orthodox by Byshe, that the syllabic composition of English lines is arithmetically positive and unalterable." He makes this view the kernel of his whole work (pp. 63, 83); reinforces it in various ways, lauding "the blessed trisyllabic swing and swell, the variation and sway on the iambic tramp."

Specialists, editors of critical texts, and original investigators in the non-literary features of the field covered by this volume are likely to dismiss it as amateurish or detest it as irritating. Flouts at them and their kind occur broadcast. These open invectives or sly sneers make nutty reading for any one whose ox is not gored, and where they hit they will smart most because none is without a modicum of truth and sense—as for instance: "Notions as to Middle English grammar, prosody and pronunciation, which have been excogitated by guesswork, or, if that seem too uncivil, by inferential hypothesis."

But, although this book is unlikely to carry with it the established cliques, it is certain to set them reflecting, while for students it will be invaluable. Anyone who has worked over the literature of critical comment on this period knows its lack. The dissertations, treatises, and monographs on Middle English, while painstaking and ac-

curate, weary the most fanatical devotee of the subject and send forth no glint of a ray to allure outsiders. This volume may win even those totally ignorant of it to read the poetry of the time. Nowhere else can a student find such illuminating characterization of the defects of the rhythming of Layamon and his congeners as on pages 53, 76, and 181; nor of the vital excellences of Chaucer's metrizing as on pages 155, 157, and 199; nor of the versing of Lydgate, Occleve, Hawes, and Barclay, as on pages 234-240, 382 and 419, of its differences (page 324) from that of Googe and his kind on the one hand, or on the other (page 306) from that of Wyatt and Surrey.

The most extraordinary thing about this volume is that, unintentionally as it would appear, the author has produced the one English book now existing which is likely to be of real use to those who wish to perfect themselves in the formal side of verse composition. In strong contrast with the vague jargon or positive misinformation of most, if not all, of the manuals on metrics, a neophyte at versification will here find, dropped by the wayside, definite precepts of genuine worth. These occur too frequently to quote, but we may point to this single maxim: "It is a mistake to try to make foot-correspond with the word-division; the best metre is often that which divides the words most."

By no means extinct is the delusion that, however valuable the early poetries may be as sociological or linguistic material, everything, Chaucer excepted, before Tottel's Miscellany is to-day negligible as literature. This volume (quite by the way) will convince the most skeptical that, from its earliest examples, Old and Middle English poetry is full of vital lessons for present and future verse-makers and poets.

But few errors or defects obtrude themselves. Yet there are errors. Mr. Saintsbury placards his determination (pp. 7-10) to miscomprehend Skeat's preface to *Guest*; and, on page 311, oddly calls Wyatt's *Terza Rima* "interlaced heroic couplets." The proof-reading is not impeccable. The parenthesis on page 59 should end with "tydings"; false indentation of the lines mars the printing of the quoted stanza in the note on page 154 and of the first in the note on page 251. On page 262, "44" should be "4.4." The index is not perfect. For instance, one seeks in vain for *Ottava Rima*, and for *Riding Rhyme*.

Zarathushtra, the Achaemenids, and Israel.

By Lawrence Heyworth Mills, Professor of Zend Philology in the University of Oxford. Leipzig: F. A. Brockhaus.

The connection between Zoroastrianism, the religion of ancient Persia, and that of Israel is interesting, not only to the student of Oriental literatures and religions, but in even greater degree to Christian theologians. To an elucidation of this problem Prof. L. H. Mills of Oxford, an American by birth, offers an important contribution in his present work, which is itself a continuation of his volume on "Zoroaster, Philo, and Israel." Beyond question the leading authority now living on the Gâthas, the oldest hymns of the Iranian faith, Professor Mills devotes to the volume under consideration a wealth of learning and thought. The first half of his book is given to a careful study of

the Old Persian inscriptions as compared with those sections of the Bible concerned with the proclamation of Cyrus for the rebuilding of the Temple at Jerusalem. Here he proves the virtual authenticity of the Old Testament records and their harmony with the Persian inscriptions of Darius, who carried out the religious policy of his predecessor Cyrus. He then proceeds to show the harmony between the Old Persian texts (and, by implication, of II. Chron. xxxvi., Ezra I., and Isa. xliv., xiv.) and the Avesta. He neglects, however, to point out the indebtedness of the phraseology of the Old Persian inscriptions to the Assyrian and Babylonian royal texts, whose influence on the style of the Achaemenians seems to have been far greater than was that of the Avesta. Nevertheless, Professor Mills's book is the best study on the spiritual life of the Achaemenians which has so far been written.

His position on the moot problem whether the Achaemenians were Zoroastrians seems to be the only one tenable with the data at present known to scholars. He grants that in ultimate origin the three religions which he calls "the Vedic, the Zarathushtrian, and the Dacic" were derived from a common Indo-Iranian source. This is perfectly true. And then, with a directness which deserves the highest praise, he writes: "I sincerely hope no serious person will ever suppose that I am aiming at establishing anything like an identity between these two lores [the Old Persian and the Avesta], even though I strive to lessen their divergence, and closely as I may endeavor to explain them as they approach each other in their interior elements and in their historical developments. Upon absolute identity we must not waste a thought."

The second half of the volume is devoted to the Avesta and its influence on the Jews of the Exile. Here Professor Mills wisely stresses the fact that the so-called Younger Avesta, though later in date of composition than the hymns of the Gâthas, really represents a recrudescence of the pre-Gâthic religion of Iran. His provisional conclusion, however, that the Younger Avesta dates in the main between 700 and 500 B. C., seems open to question. Even without emphasizing Iranian tradition, which, at least in its extant documents, is late and suspiciously exact, and which places Zoroaster in the seventh century B. C., it is not necessary to suppose that Herodotus was influenced by the Yashts now in existence. It is not improbable that he may have known the non-Zoroastrian worship of Iran before it had been permeated by the great reformer Zoroaster. This is the more probable if the earliest seat of orthodox Zoroastrianism was at Balkh, as seems to have been the case; for a very considerable lapse of time would

be necessary for the reformed religion to make itself felt in the western parts of Persia known to the father of history.

The final section, which is on the debt of Judaism to the Avesta, is developed almost too slightly. Notwithstanding the writings of Stave, Böklen, and Söderblom, and despite the antiquated treatise of Kohut and the somewhat exaggerated conclusions of Cheyne, one cannot but wish that Professor Mills would complete his trilogy by devoting a separate volume to the debt of Judaism to the Avesta and to the debt of the Avesta to the Semitic world, especially to Babylonia.

In a work so admirable it may seem ungracious to call attention to faults of detail, yet it must be said that the English style of Professor Mills's book is not easy reading. Occasionally, also, there is a statement which is open to question. The name of the river Euphrates (*Ufrānu* in Old Persian) is probably Sumerian and not Iranian in origin, and in spite of the author's elaborate plea, it is hard to see that the phrase "God of heaven" in the decree of Cyrus recorded in the Old Testament necessarily implies that the supreme deity of the Achaemenians was Deva, "he of the shining (sky)."

The Social Ideals of Alfred Tennyson. By William Clark Gordon. Chicago: The University of Chicago Press. \$1.50.

As a thesis for the doctorate this essay is an instructive example of the bewildering effect of a study of sociology. Of Dr. Gordon's rather cloudy philosophy it is difficult to give a clear idea. Perhaps it would be better to let the Doctor speak for himself.

The serviceableness of literature to sociology is almost wholly dependent upon the faithfulness of literature to the artistic ideal in the portrayal of life. Mere description of physical conditions and statement of social facts have their value, but it is the psychological elements for which the sociologist looks most eagerly and which he studies with greatest care. He wishes to know of what people have been thinking; what ideas they have cherished for the home and for the Government; how they have regarded woman; what attitude they have taken toward those of different rank and social station; what desires have exercised a controlling influence in the lives of men and women; how the emotional life has expressed itself—all these and a hundred other things of kindred nature are of very great importance to the student of human associations.

This is the kind of thing that he expects of literature. In other words, he looks upon literature as a storehouse of social fact—or, rather, as a reproduction of social conditions, a *milieu* or what not, which the sociologist can study in default of the original. But mark the confusions. Literature does not guarantee the accuracy of its facts—indeed it is not a report at all, but rather

an interpretation; and that interpretation is individualistic, or in other words, is an attempt to choose and arrange facts in such a manner as to bring out their personal significance. Is it, then, the author's subject or his consciousness, which constitutes the social data? But his consciousness is in a measure exceptional, as is also his writing; for you may say that after all it is only the permanent portion of his work, and that of no particular social complexion, which is literature in any just sense. There is Thackeray, for instance; does any one pretend to say that his conception of life is a pattern of the social thought of his time? And it was only the other day that a clever and amusing critic undertook to show that his novels were altogether one-sided and hence false as a sociological document, as no doubt they are, being satire and not *comptes rendus*.

Why, then, should not the sociologist, like the *littérateur* himself, fall back directly upon the indisputable facts, statistics, memoirs, correspondence—there will soon be enough of them—and whatever other sources are to be come at? Here is the curious and original part of Dr. Gordon's notion. He seems to think that it requires the imagination and passion of literary genius to animate such materials sufficiently to make their study a study of life and not of dead lumber. The point is well taken; there is undoubtedly much to be made of literature as a depository of thought, as Dr. Gordon has discovered. What he fails to see is that such a study will be moral, not social; in short, it will not be sociology at all, but criticism. It is the vision of the author which is revealed primarily in his work. But if Dr. Gordon wishes to collect what shadows of social habits, manners, and the like are traceable through that medium, to disentangle the influences of his *milieu* upon the author and the author's reaction upon society, and to call the result sociology; there is no reason that he should not. Every serious man is bound to be thankful for all the information he can get upon life and literature. Only why so much pother about what is after all a very plain and obvious exercise, a mere cataloguing of Tennyson's utterances on such subjects as the family, the state, and the church, woman?

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 6, 1906.

The Week.

The President may well take a personal pride in Monday's naval review, for it is largely due to his teachings that the fleet assembled was the most powerful ever gathered for Presidential inspection. Lincoln's fleets were, for their period, as formidable and much larger, but there was no opportunity to have them parade for his pleasure. When the civil war was over, the ships were rapidly dispersed; the ironclads were laid up or sold to foreign nations. Within a few years our coasts were patrolled only by the graceful wooden ships-of-war of the Kearsarge type, until, in the late eighties, the white squadron began to appear. Those Americans who believe, like Mr. Roosevelt, in the Big Stick, will get profound satisfaction out of Monday's proceedings; the ships are admittedly splendid vessels, officered by men of skill and ability, coupled with Yankee ingenuity and determination to succeed. They have been inspired of late years by their successes in the war with Spain, Mr. Roosevelt's incessant preaching of the gospel of "preparedness," and the readiness of Congress to vote large appropriations and increase the naval force from about 8,000 to 33,000 men. For ourselves, we hope that this review marks the climax of our naval war-strength; that henceforward our navy will begin to decline in size by reason of faith in our coast defences, a more pacific policy in Washington, in accord with Secretary Root's South American speeches, and a realization that the duty of the United States is not in the direction of war and great armaments, but of humanity and peace.

The agitation for a reorganization of the Democratic National Committee is based on a clear perception of the present peril of the party. Four of the members of the executive committee, for example, are not even members of the National Committee; they are William F. Sheehan of New York, chairman; August Belmont of New York, James Smith, jr., of New Jersey, and Senator Thomas S. Martin of Virginia, while the remaining three are James M. Guffey of Pennsylvania, John R. McLean of Ohio, and Timothy E. Ryan of Wisconsin. Not one of these men is a truly rational figure; several of them, including Mr. Belmont, by reason of their close affiliations with unpopular corporations, render the whole committee, in the existing state of public opinion, liable to effective attacks. Not only is the membership of the executive committee un-

fortunate, but Thomas Taggart, chairman of the National Committee, is himself alone enough to discredit the whole organization. He was never big enough for the place, even when he was at the height of his Indiana successes. Throughout the Parker campaign, he demonstrated his total unfitness. More recently the revelations as to the gambling carried on at his French Lick and West Baden Hotels and his attempt to cutwit the State of Indiana in its efforts to close up these resorts, have earned him the contempt of honest men the country over. The Democratic press is everywhere demanding his resignation; if the National Committee were really responsive to the feelings of the great mass of Democratic voters, Mr. Taggart could not hold his place a day.

If only as a pledge of better relations with Spain, the reciprocity agreement recently signed at San Sebastian is very welcome. It affects mainly wine, spirits, and their by-products, and admits also American manufacturers to Spain under the minimum tariff. The agreement represents the very small latitude allowed the President by the Dingley act. The question is pertinent if the President may by proclamation reduce the tariff on argols, cream of tartar, painting, statuary, wines and spirits, and no cataclysmic effect upon the national prosperity be observable, why might he not, Congress and the late Mr. Dingley permitting, have knocked a quarter off the iron and steel schedules? Would a similar dealing with the wool duties destroy confidence and bring us to universal bankruptcy? Or, again, if duties may be substantially diminished by Presidential proclamation, and no evil ensue, might they not be modified as much by Congress without precipitating disaster? Of course, we are aware of the awful consequences of "opening the tariff," and yet the evident harmlessness of these small revisions should give courage to all Republicans who sincerely wish better tariff conditions. The trouble is that the party doesn't really want courage; it wants a continuance of the panic fear that makes it impossible to do anything but stand pat with quaking knees.

Such a situation as exists to-day in the New York money market is a disgrace to the community. A 30 per cent. rate for Stock Exchange demand loans, such as prevailed in Wall Street Tuesday, is bad enough in itself; it throws an atmosphere of absurdity around the assertion, lately popular in that quarter, that New York was fast becoming

the "money centre" of the world. Indeed, when one takes into account the immediate and perfectly well-known cause for the violent stringency, one is tempted to ask whether New York's "high finance" is on a much higher plane to-day than it was when Fisk and Gould made history in railway management and the gold market. Three or four weeks ago it was evident to all experienced men that the New York money market was under an abnormal strain, and that only the utmost restraint in taxing loan resources could avoid a serious situation. Unprecedentedly active trade was itself absorbing, through natural channels, an exceptionally large part of the country's free capital. Widespread real estate speculation, always a heavy drain on available resources, had locked up another part. The New York bank position, disclosed by its official statements, was the weakest with which those institutions had entered the active autumn season since the panic of 1893. This was the moment chosen by men in positions of great responsibility to start a stock speculation of a wildness and violence rarely equalled since the mad days of April, 1901. The effect on the money market was inevitable. If the only upshot of this discreditable business were to be the "squeezing" of stock speculators by a 30 or 50 or 100 per cent. money rate, the episode might be dismissed with contempt. Unfortunately, however, the interests at stake are of far greater concern than speculating railway directors or Stock Exchange borrowers. Using, as the promoters of this speculation apparently have done, all available credits, both in New York and London, they have visibly depleted the resources on which legitimate industry was relying—the evidence for which is that merchants' paper also has to pay a higher rate to-day than it has paid at this time of year since 1893.

Addressing the American Bar Association at St. Paul last week, Judge Alton B. Parker deprecated the present flux of special legislation. He called attention to the fact that most *ad hoc* laws were simply a confession that the general statutes applicable in the premises had not been enforced. Frequently the demand for new laws represents only hysterical clamor for a victim. Such legislation corresponds merely to a vague desire to do something exemplary, though existing statutes may provide an adequate remedy. This hand-to-mouth view of the legislative function produces annually in the United States an average of something like 15,000 laws, mostly of a special character. These merely complicate the already difficult task of the courts, and obscure underly-

ing principles of jurisprudence. A remedy for the present hurly-burly implies a change of mind among our lawmakers. Until they approach their duties with something like the judicial spirit, we shall presumably continue to load the legislative blunderbuss with all the legal shards and scraps in sight—in the hope that the explosion may bring somebody down. But Judge Parker finds one available resource in that practice of the British Parliament by which all bills are referred to an expert jurist. This official not only makes himself responsible for the verbal form of the bill, but also reports on its relation to previous legislation. Evidently, a scrutiny of this sort would prove that a large proportion of bills in Congress and the State legislatures are superfluous or actually repugnant to existing laws.

The first business brought before the Interstate Commerce Commission under the new law consists chiefly of old grievances for which shippers were unable to secure relief formerly, and which they bring up again in the hope that the more powerful body may put an end to their difficulties. Of such a nature is the eighteen-year-old complaint of the city of Spokane, Wash., which, although hundreds of miles from the coast, pays a higher rate on shipments from the East than Seattle. The new Rate Commission which the State of Washington created last year has power to lower the rate from Seattle to Spokane—the imaginary “back haul”—but so long as the railroads add this intra-State charge to the inter-State rate from Seattle to the East, the place can never stand on an equality with its coast neighbors. The Spokane case involves the whole principle of water competition, just as other complaints recently filed take in the other fundamental problems of rate-making. But the list of grievances thus far gives little confirmation to the prediction that every through rate would be complained of, and that the Commission would ultimately be forced into a general revision of railroad tariffs.

The most violent negrophobe cannot fault with Booker T. Washington's address before the Negro Business Men's League in Atlanta last week. It must have taken some courage to hold the meeting in that city just now, not only because of Hoke Smith's success in his campaign to disfranchise the colored people, but because of the bitter feeling aroused by five attacks within five weeks upon white women by colored criminals. To this must be added the criminals. Mr. Washington's emphatic and earnest address, largely devoted to the question of negro crime, is a restatement of his previous position. He sees clearly that the negro criminal is the greatest danger confront-

ing his race, and he calls upon all decent people of his color to aid in the punishment of the offenders. But Mr. Washington goes further, pointing out to the whites that they owe it to the colored people to extend to them protection of the law. A recent lynching by a mob of negroes gives edge to his contention that every man, white or black, who takes the law into his own hands is insulting the executive, the lawmaking, and judicial powers of the state.

The Metropolitan Museum has added to its small collection of American sculpture a number of little bronzes by such able contemporaries as Gutzon Borglum, Anna W. Hyatt, A. P. Proctor, Frederick S. Roth, Bessie Potter Vonnoh, and the late Paul Nocquet. This is the earnest, one may infer, of a more liberal and systematic attention to American art. The pieces are mostly of cabinet size, and, frankly, we think this is for Museum purposes a distinct merit. To begin with, the best of our contemporary sculpture, with rare exceptions, is of this sort. Few of our sculptors, even of those who habitually work on a heroic scale, have monumental quality. Moreover, these little exhibits are of a very available sort; they require little space, they quarrel neither with each other nor with the general decorative effect of a gallery; they can readily be withdrawn or stored if a subsequent taste should find them below museum standards. As for the bigger sort of contemporary statuary, one almost dreads to see it come into a museum. It is costly to keep it, and apparently almost impossible to get rid of it when once exhibited. Besides, a great sculptural composition should be, and usually is, made for a given site or position, and accordingly loses something in the artificial lighting and surroundings of a gallery. In building up the contemporary display of American sculpture we are glad that the Museum committee has given the little pieces the preference.

The overwhelming victory of the American boats in the *Sonderklasse* race off Marblehead on Monday seems to be primarily a triumph for our builders and riggers. No doubt, such seamanship as that of Charles Francis Adams, 2d, the skipper of the winning boat Auk, counted for much, but, in an open course and a half gale, that would not explain a lead of more than ten minutes in fifteen miles. In spite of the beating they have had, the German visitors should find comfort in the fact that no one of the three American boats has been clearly the best in the trials. Slightly varying conditions of wind and water make a great difference with these sensitive craft, and though the outlook for the visitors cannot be said to be bright, they

may fairly hope to make a better showing. The series will afford splendid sport, but the boats are so much of a sort—being all fin-keel scows with deep lead—that the races will give no new lesson as to design. That, after all, is a minor matter; the important thing is the opening of cordial relations between American and German sportsmen. From this point of view one is very glad that the North Shore has been chosen as the scene of the international contest. There is no place where the German skippers could get a truer or more favorable impression of American yachtsmen; no place, we believe, where they would receive a hospitality more generous and more discreet.

A combination of concession and recession has occasionally in the past diverted revolutionary activity into peaceful channels; in the case of Russia the formula is probably being applied too late. The scheme for the distribution of the appanage lands would presumably have been welcomed two years ago; today it appears to make little impression. Similarly, before the closing of the universities and higher schools had scattered the natural leaders of revolt throughout the Empire, the policy of proceeding against agrarian agitators through the police might have been effective; to-day wholesale arrests in the provinces will do about as much to avert revolution as a popgun to frighten wolves on the steppes. For a manly attitude towards a desperate undertaking Premier Stolypin deserves all credit. But week by week it becomes more evident that without the Duma nothing can be done. From hated hands favors may indeed be received, but never with contentment; and Russia apparently hates the forces that move the hands of the Czar. But no remedy except that provided by the national assembly is likely even to have a trial. The time has passed when concession can satisfy or recession terrify. It is not even certain that a travelling nation would obey its own parliament; yet that still appears to offer a chance for an orderly solution. Every other way lies anarchy.

The Prussian Minister of the Interior, Gen. von Podbielski, has not yet been forced out of his office by the colonial scandals in which he is involved, but he will be retired, it is understood, as soon as the case of Major Fischer, now under arrest for corruption, is investigated. The Chancellor, Prince von Bülow, has been compelled to return to Berlin to supervise the official housecleaning. The head of the Colonial Office, Prince Hohenlobe, has been accused of taking two salaries; and the revelations as to monopolies granted by his office have now involved the Wörmann steamship line. This com-

pany had invested only about \$250,000 at Swakopmund in boats, lighters, and other plant; yet it made in one year \$325,000 out of the Government merely for landing supplies transported to Southwest Africa in the Government's own ships. Although only about 4,000 tons of supplies could be discharged in Swakopmund every week, the Colonial Office had at times as many as seven or eight steamers in port waiting to unload their cargoes, of which the troops were often in great need. In consequence of this delay the Government had to pay the Wörmanns large sums. Thus the company obtained from the Government a revenue from three different sources: freight rates, landing costs, and penalties for the delayed ships—the latter charge is said to amount to \$750,000 alone. Yet it never occurred to any one in the Colonial Office to hire ships of other lines, to get English vessels, or to send out ships at such intervals that there would be no congestion at their destination.

The present condition of Spanish agriculture is interestingly set forth in the *Temps* by M. de Contenson, French consular agent at Huesca. What the farmer of Spain needs is capital and water. The former requirement is universal and not subject to especial remedy; the second need the State might do much to meet. Travellers over the great central plateau are struck by the arid nature of the country. Water there is in abundance; its ravages are shown in torrent beds and riven hillsides; but, owing to the reckless deforestation of the land in old times, most of it goes to waste. With a fair rainfall and mountain snows to count upon, the storage and distribution of water through irrigation ditches is a simple problem of engineering; the difficulty is economic. M. de Contenson shows that the suspicious Spanish farmer distrusts the irrigation companies. He would rather be sure of his present pitiful gains than seek a larger profit which must be shared with a third party. The result of this feeling, and of the very small return per acre in arid cultivation, has been totally to eliminate the small farmer in many regions. The remedy suggested is such taxation of half-improved farm lands as will force the great proprietors to sell or irrigate their properties. Probably a reform must come through the great landowners; for the peasant, who now sells his olives on the trees for want of cash to have them milled, will be averse to paying a water rate. On the other hand, one can hardly doubt that the ability which has created the great manufacturing interests of Catalonia and Andalusia will sooner or later direct its attention to the waiting soil.

A report of socialistic progress among

the Italian *carabinieri* is disconcerting enough to admirers of that *corps d'élite*. For ordinary police officers to organize and strike is bad enough, but any disloyalty in this superb mounted infantry would soon affect the internal peace of Italy. These sturdy Piedmontese who patrol the country roads in pairs are to the average Italian the very embodiment of law and order. They are a terror to evildoers and a protection to all inoffensive wayfarers. If they are infected by the virus of Socialism, it is hard to see what class can hope to be exempt. Imagine Paris with the Republican Guard on strike; that would be Italy with the *carabinieri* disaffected. One must hope that the alarmist reports are greatly exaggerated, and that the honest faces under the three-cornered hats still look for orders to the Royal House of Savoy, and not to the walking delegates.

The vast differences between labor-unionism in England and the United States are emphasized afresh by the opening meeting in Liverpool last Saturday of the thirty-ninth annual Trades-Union Congress of Great Britain. Several of the delegates are members of the House of Commons, men of national reputation and wide experience in affairs. One of the proposals of the British Congress is that "technical education be an essential part of every child's education, and secured by such an extension of the scholarship system as will place a maintenance scholarship within the reach of every child." This contrasts sharply with the attitude of trades unions which in this country discourage by every possible means technical or trades schools as a supposed menace to organized labor. Some of the proposals of the British Congress, such as old-age pensions, are as radical as unionists in America could wish; but the greater part of the discussions show that the participants are working for the welfare of the nation, and not, like labor "leaders" in the United States, for strengthening the unions by use of the boycott, suppression of apprentices, burdensome levies, and the like. Samuel Gompers and his coterie may well study this English Congress.

Australia threatens to become protectionist with a vengeance. Premier Deakin asks not only that the tariff be put on a virtually prohibitive basis, but that he be granted power to suspend any importation of goods to be sold at less than the local market rates. Under such a law Australian manufacturers might combine to raise prices with impunity, for the competitive article from overseas must always be offered at even price, on pain of exclusion from Australian ports. The sentiment which the Premier voices is for keeping out all

manufactures, British or otherwise. Bills to this effect, it is believed, may pass the Parliament of the Commonwealth at the approaching session. In the farming and grazing districts, which will be cruelly mulcted by the proposed tariff, there is naturally much discontent, but so far it has not crystallized into an effective opposition. The manufacturing interests retain control of the political machine. Such an Australian adventure in protectionism would be a death-blow to the moribund cause of Imperial reciprocity. Canada, too, is likely to revise her tariffs upwards without further concessions to Great Britain. One must regret the general reactionary drift towards mediæval notions of trade and revenue, but there is at least a certain poetical justice in the undoing of Mr. Chamberlain and his designs, by the very spirits he has conjured from the depths of national selfishness.

The cottage in which, according to tradition, John Bunyan was born, at Elstow, is reported to be much dilapidated, and a writer to a London paper suggests that it be purchased by the nation and preserved. The building is a typical little English cottage, a picture of which is printed in some lives of Bunyan. In a memoir of Bunyan written as long ago as 1839 the Rev. Henry Stebbing complained that "the present occupants seem no more interested about Bunyan than are any other of the villagers; they have no story to tell, no fancy or vision to describe with reverent look; and the stranger is allowed to leave the cottage without having received the least encouragement to guess in which room Bunyan was born, or on which side of the fire he used to sit, or whether there be a tree of any kind reported to be planted by his hand." This indifference to the fame of the preacher-tinker is, we fear, spreading. "Pilgrim's Progress" is not thumbed by the children of to-day so diligently as by those of a generation or two ago. In many families there is less distinct religious life, and the old line between "Sunday" reading and that which is appropriate for week days is rapidly fading. In this liberal era the refined humor of "Buster Brown" and the "Katz-enjammer Kids" is left to do the work once performed by Christian, Great-heart, and Mr. Valiant-for-Truth. If ever we fall back into that stage of unsophisticated piety which makes it seem worth while for a man to glance at the pages of a good book at least once a week, "Pilgrim's Progress" must resume its primacy in Sunday reading. In the meantime many persons with memory of happy Sunday afternoons spent on the road to the Celestial City must be ready to subscribe for the preservation of Bunyan's birthplace,

MR. BRYAN, 1896-1906.

Everybody knows what was thought of Mr. Bryan when he came to New York in 1896. What has happened to make the great difference in his reception last Thursday? What changes in the political world, or in him, account for it? Wherein is he the same as he was ten years ago, and wherein altered?

Mr. Bryan is the same in being a very taking popular orator. He was that in 1896. His cause was bad, but his speaking was plausible and even persuasive. He probably can never reach the highest flights or satisfy the most exacting taste; but as a man able to appeal broadly to the masses, to impress his hearers with his own earnestness and honesty, and to clothe his thoughts in simple and direct English, it would be hard to name his equal. Popular oratory of that kind is still a political power. Unchanged, except as years have heightened it, is also Mr. Bryan's ability to identify himself with the aspirations and strivings of the vast working and middle classes. Many in the East laugh at his being called "The Great Commoner," but the phrase represents a tremendous political fact. Mr. Bryan is held by the rank and file of his party, and in general by the common people, in an admiring and affectionate regard which recalls the fondest traditions of Henry Clay. Time and again has Mr. Bryan demonstrated his power. Never was it more conspicuous than in 1904, the year of the seeming triumph of his opponents within the Democratic party. They had the Convention at St. Louis, yet he was its dominating figure. And his campaigning later was, as Judge Parker himself acknowledged, the most vitalizing that was done. No one can keep at all in touch with men—can see Mr. Bryan's portrait still kept in the home of the workingman alongside that of the Pope—and not have the truth beaten in upon him that this self-made man is preëminently a man of the people, knowing instinctively the way to their hearts.

While admitting these great qualities in Mr. Bryan, with his exceedingly amiable and even engaging personality, it remains for prudent men to ask if there is any sign that he has mastered his notable defects. It is confidently said that he has "grown." But we must await the evidence that he has grown away from the ingrained habit of his mind. It was that which frightened staid citizens in 1896 and 1900? What we mean is Mr. Bryan's way of catching up some issue which is clamorous and seems popular, not taking time to look into it thoroughly, but committing himself on it deeply and pressing it in vehement and even inflammatory speech. That was the essential vice of his attitude on the silver question; and it is a vice which he exhibited in his speech last

week in Madison Square Garden. There he gave an exhibition both of his skill as an orator and of his defects as a statesman.

If on that occasion his aim was to drive hard at his political opponents, while making it difficult for them to strike back at him effectively, he had much success. The reason is that he has an almost invincible argument *ex concessis*. "You admit," he says, "that I was right in demanding, when your party was silent about it, Government rate-making on the railroads. You admit that I was right in calling for a Federal license for corporations doing an interstate business. That plan has since been urged by your own Administration. You admit that I was right in advocating the stern application of the full power of the Government to the restraint of Trusts. You admit that I was right when I cried, 'Plutocracy, there is the enemy.' Your own President has been forced to advocate the 'curbing' of great wealth. But if all these policies are the true ones for the country, I and my party, not you and yours, are the fit agents to execute them. Look at the way your well-meaning President is hampered in his radicalism! The corporations and the interests, with their grip upon the Republican party, are too powerful for him. Let the people give the Democrats power, and, with myself in the White House, the country will get the Simon-pure and thoroughgoing radicalism of which Republicans can give only meagre and disappointing imitations." That argument is extremely awkward to answer.

But as a constructive statesman the new Bryan has the chief fault of the old. He is provocative, not to say inflammatory, but wholly vague. He rouses passions without directing them. He puts forth a tremendous scheme, without showing any sign of having thought it through, and without indicating a single detail. He is in a great state of excitement about plutocracy, but just how he is to put a hook in its snout, one reads his speech in vain to discover. And as for his plan of Government ownership of all the trunk lines, with the States to own the railroads wholly within their own borders, he jauntily projects it before the crowd without giving a hint how the immensely difficult problems of management and financing are to be solved. How the properties are to be bought in, how the \$13,000,000,000 of money is to be raised—those are "mere details" which do not exist for this grandiose political thinker.

This fault in a leader of the people is fatal. Flights of oratory, ardent hopes, glowing aspirations, millennial dreams—these are all very well, but a real statesman will not attempt to dazzle men with them until he is prepared to produce the necessary Constitutional amendment, the required draft of a stat-

ute, the project of taxation needful, the inexorable financial balance-sheet. Here Bryan still falls far short of the definition of a statesman. He is, indeed, Burke's "man full of warm, speculative benevolence," who wishes "his society otherwise constituted than he finds it"; but is he not open to the charge of "considering his country as nothing but *carte blanche* upon which he may scribble whatever he pleases," and of neglecting "the existing materials of his country"? If he is, then our judgment of his vague proposals can scarcely be other than that they are "vulgar in the conception, perilous in the execution."

JOHN BROWN FIFTY YEARS AFTER OSAWATOMIE.

Kansas has just celebrated, with the aid of the Vice-President of the United States, the semi-centennial of the "battle" at Osawatomie, Kansas. This was a fight between the Free-Soilers, led by John Brown, and a force of pro-slavery raiders variously estimated at between 400 and 1,100 men. It resulted in the defeat of Brown after he had killed 31 of the enemy and wounded between 40 and 50. Among his own killed was his son Frederick, who, though not attached to Brown's fighting column, and offering no resistance, was shot dead by the pro-slavery scouts. It was, in brief, one of many collisions in a purely guerrilla warfare. The leader of the Free-Soilers was a man who shed blood ruthlessly, and who perished on the scaffold for the crime of inciting slaves to insurrection, for treason, and for murder; yet John Brown and his defeated followers are honored as men who performed noble and patriotic service.

According to those who took part in the Kansas celebration, Osawatomie was one of the world's important battles which brought Appomattox in its train as surely as Yorktown followed Bunker Hill. Indeed, since 1877, a marble monument has stood at Osawatomie in "commemoration of the heroism of Capt. John Brown, who commanded at the battle of Osawatomie, August 30, 1856, who died and conquered American slavery at Charlestown, Va., December 2, 1859." To this Kansas battlefield is thus assigned an importance hitherto awarded by some historians to Harper's Ferry. It was from the latter that, in the popular estimation of the time, his soul went marching on to quicken the hosts that destroyed the Confederacy. To Brown himself is given a rôle which plainly cannot be assigned to any man—not even to Lincoln—and does manifest injustice to heroic Abolitionists who fought the battle for human freedom, by peaceful means, years before John Brown appeared upon the scene. In this connection it is a curious fact that of the prominent Abolitionists, only two perished by violence, and these, John Brown and

Elijah Lovejoy, invited their fate by resorting to arms.

As for Brown himself, however great his influence in bringing on the civil war, the latest historians are not ready to concede that his services to Kansas itself were of the highest importance. Thus, James Ford Rhodes declares with "great positiveness" that "he has been called the liberator of Kansas, but it may be safely affirmed that Kansas would have become a free State in much the same manner and about the same time that it actually did, had John Brown never appeared on the scene." Professor Spring, in his story of Kansas, affirms that "John Brown is a parenthesis in the history of Kansas," and a similar view is taken by Charles Robinson, in his "Kansas Conflict." Indeed, to Mr. Rhodes, as to others, the massacre at Pottawatomie is far more important historically than the skirmish at Osawatomie, and of Brown's blood-guilt on that occasion there can be no doubt. When his own son asked him if he had anything to do with that bloody affair, Brown replied: "I approved of it." His son answered: "Whoever did it, the act was uncalled for and wicked." The father then responded. "God is my judge. The people of Kansas will yet justify my course." As a matter of fact, he gave the signal, and his followers committed the murders. The celebration must not be regarded as a commemoration of this massacre; perhaps it is to throw Pottawatomie further and further into the background that Osawatomie is acclaimed.

And yet Brown had noble traits enough to stand forever a great figure in American history. To him the killing that he did was not murder, but merely "the execution of a decree of God." As in the case of the Russian revolutionists of today, the horrors and wrongs he witnessed were beyond his power to endure peacefully. As they have turned to the bomb, so he assailed the slave power practically single-handed; a puny David who was crushed by the Goliath he assailed, he yet began the violent destruction of his enemy. To our minds, the Russian terrorists are more nearly justified, since peaceful agitation is denied them; nevertheless, no one can doubt the sincerity or the religious earnestness of Brown, or his belief in his inspiration from on high. His was an Old Testament figure, and even the leader of the non-resident Abolitionists was compelled to say, on the day John Brown was hanged, that slave insurrections such as that at Harper's Ferry were a "positive moral force."

Emphasis may most fitly be laid upon the courage and nobility displayed by Brown between his capture and his execution. Here he proved himself the moral hero in every sense—calm, dignified, and ready for death. As Frederick

Trevor Hill has recently pointed out in *Harper's Magazine*, there came to him during his imprisonment a prophetic realization of what his death on the "glorious gallows" would mean to his cause. "I feel," he wrote, "just as content to die for God's eternal truth on the scaffold as in any other way." Hence the one bitter moment of his trial was when an effort was made to question his sanity. This he indignantly checked himself. From that time on he was buoyed up by a wonderful serenity, an elevation of spirit due partly to his being without consciousness of guilt, partly to his ready submission to the inevitable. "My mind is very tranquil; I may say joyous," was one of his last messages. Unquestionably, his bearing at this crisis has done much to make people forgive his attempt to right wrong conditions by the un-American method of invasion and force. This forgiveness is one explanation of the celebration in Kansas. Another is that people in the North still reverence the men who freed the South from slavery and still cling to their ideals of equality before the law and at the ballot-box.

BANK PRESIDENTS, DIRECTORS, AND PROMOTERS.

Few elements in the tragedy of commercial foul play seem to be lacking in the affair of the Real Estate Trust Company of Philadelphia. The president—a man of unchallenged repute in religious, charitable, and financial circles, for all of which he was a trustee to large amounts—dies suddenly. Examination of the bank accounts discloses practically worthless collateral for much more than half of the institution's loans. The company's doors are closed, and further inquiry shows that the president died by his own hand. The story is the familiar and sordid narrative of the speculating trustee in a market which is "certain to go on rising." No one need be surprised that in this Philadelphia episode, as in the Stensland affair of a month ago, it is real estate speculation which has done the business. The "realty boom" has cut a figure, these past few months, more sensational, perhaps, even than the stock market demonstrations.

The incident forces upon the public several serious warnings. The most obvious is that the consummate swindler is apt to cloak himself in religious pretence. Mr. Hipple was so scrupulous in the performance of his religious duties. Even in minutiae like abstention from tobacco and the Sunday newspaper, he was such a model to the young. "Why," says an inconsolable Presbyterian, "it's enough to break down faith in human nature!" But faith in human nature ought to go with some knowledge of it; and no fact of it is better established than that hypocritical religiosity is the

final touch of imposture. Faith in human nature is a fine thing, and regular attendance at church is excellent; but in the banking business we cannot get on without inspection that inspects and direction that directs. Without them, snivelling hypocrites will go on, for a pretence, making long prayers in order that they may the more easily devour widows' houses.

This shortcoming of the directors is the second point to be noted. In the Philadelphia case the directors had not met for over two years. Hipple was thus unfairly subjected to the sorest temptation. There are financiers, we are willing to believe, able and upright enough to manage a banking institution single-handed; but it is evident, first, that no honest man would desire so invidious a responsibility, and, next, that nobody should be exposed to that kind of moral hazard. Hipple is dead and beyond reach of the law, but his derelict directors are alive, and are responsible for the losses. We have had occasion to note the desirability of imprisoning crooked officers and directors when the law permits; for holding negligent officers financially responsible, the argument is irresistible. It is high time that a directorship should be regarded as a serious trust, and not merely as a ribbon to stick in the coat of dabblers in high finance.

To this phase of the matter we called attention on the occasion of the recent and equally disgraceful Milwaukee Avenue Bank failure at Chicago. Stensland abstracted the money by the clumsy device of making loans to fictitious persons, and pocketing the proceeds. A clerk at the ledger ought to have seen through this shallow trick, let alone a board of directors or a bank examiner. Hipple's plan for making away with the funds was to shift the collateral from one account to another, to make it appear that certain accounts, with no collateral at all behind them, were properly secured. The very fact that such substitution has been possible proves that directors and bank examiners should inquire sharply into the personality of the borrower and the projects for which money is used. About half of the Real Estate Trust Company's loans were made to one individual, and he a notorious speculator and promoter. The directors were men of business experience; all of them may be presumed to have known of Segal and his exploits. Under such conditions the published explanation that the borrower exercised a "hypnotic influence" on the president is pitifully weak. The true explanation is that these directors were either shirks or fellow-criminals.

The theory of the "hypnotic promoter" who is able to lead veteran bank presidents by the nose, calls for animadversion. We must confess to entire disbe-

lief in it, except as it means that men like Hipple have had their brains so turned by the speculative mania that they are easy victims to smooth-tongued adventurers. There has probably never been a time—certainly not since the great "land crazes" of 1856 and 1872—when promoters of this sort were so numerous, and, apparently, so successful. Bank officers throughout the country are besieged to lend money, directly or indirectly, to such enterprises. But for this purpose no banking institution has the right to lend a dollar. The bank officer who does so is simply committing his unsuspecting depositors to a plunge into real estate speculation. The bank director who permits, and the bank examiner who overlooks, any practice of the sort is guilty of gross betrayal of trust.

CAMPBELL-BANNERMAN'S SUCCESS

The death of Lady Campbell-Bannerman, terminating a happy marriage of forty-six years, will call forth deep sympathy for the English Premier, not only in England, but abroad, where his earnest efforts for international peace have won proper appreciation. On the Continent the rank of a broad and able statesman has been more readily assigned to Sir Henry Campbell-Bannerman than at home. There people admired him because he looked the typical English gentleman, a refined John Bull, with much of that personage's weight and color, and because he was such a good fighter. Through all the dark days of the Boer war, when his party seemed hopelessly discredited and out of sympathy with the masses, Sir Henry stuck to his unpleasant task of leading the Opposition. This he did manfully and vigorously, undeterred by charges that he was a "Little Englander" and that he sympathized with his country's enemies. One of the very first signs of a change in public opinion towards the Conservatives was the sudden popularity of Campbell-Bannerman. This Sir Alfred Harmsworth discovered when he inquired of his agents throughout the kingdom how the political policy of his papers was liked. The answer came back promptly: "It won't do to be too hard on C.B. He's getting popular."

When it became evident that the Conservatives could no longer remain in power, "C.B.," by general consent, was looked to as the next Prime Minister. But even in his own party the reasons given were not always complimentary. Sir Henry, it was said, had earned the honor by his hard fighting; it was to be a recompense for brave service in the hour of need, rather than the reward of statesmanship. It was even openly hinted that after he had held the place for a session he would be transferred to the House of Lords to make room for a really constructive leader.

Naturally, these insinuations greatly pleased the Conservatives. They had confidently informed the country that constructive statesmanship was an exclusive asset of their party; moreover, they were quite convinced that Campbell-Bannerman had no gift whatever for leadership. Just contrast, they said, his plain, uninspired utterances with the graceful, clever, and even brilliant speeches of Arthur Balfour. The Liberals had no leader, and if they got a big majority it would collapse for lack of coherence and direction.

Lady Campbell-Bannerman lived long enough to see this idle talk wholly dissipated. Friends and enemies alike discovered that the new Prime Minister had a genius for leadership; that he was able to control his varied following with what a shrewd English observer calls "his most admirable characteristics," serenity and composure. The gossip about his going to the House of Lords died out. After Parliament had been in session two months it was admitted that if anything should happen to Campbell-Bannerman there was no one who could quite fill his place. For the position is difficult; a large majority is far more trying than a small homogeneous one. This particular majority would have called forth all of Gladstone's great qualities of leadership. There are, for instance, the Irish, the Labor members, and what may be called radical Liberals; on the Education bill the Irish broke away entirely, and a large number of Liberals, more than were brought out by any one vote, chafed under the bill as a weak compromise and longed to separate Church and State at one blow. Nevertheless, on the final vote, after months of discussion and opportunity for friction, the Prime Minister's majority was 192. Again, on the vexed question of Chinese labor in South Africa, there has been a marked divergence of opinion among the Premier's supporters, both in Parliament and in the press. Yet Sir Henry was able to keep his followers in hand, and, after six months, the party tie is as strong as it has been at any time during the last twenty years; while, except from Mr. Chamberlain, all talk of the Administration's collapsing in a year or two is at an end.

During all this time Campbell-Bannerman's followers, particularly the younger members of Parliament, have become more and more attached to the man himself. His straight-forwardness is a lesson to shuffling politicians the world over. Several members of his Cabinet, Mr. Bryce, Mr. Asquith, and Lord Crewe, are bitterly opposed to woman's suffrage; that did not keep Campbell-Bannerman from stating to the suffragists that he was a convert to their cause, and bidding them wait in patience for the victory which is sure to be theirs. Prime ministers rarely

make such frank expressions of merely personal convictions, and it would have been easy for Campbell-Bannerman to have avoided the issue. Similarly, his stand on other questions is known to all, in striking contrast with the evasions of Mr. Balfour on the tariff issue. Nor has Campbell-Bannerman lost any of his aggressiveness, now that he sits on the Treasury bench instead of in opposition. The warmth and vigor of his replies to Balfour, whom he only recently denounced in round terms for making the "most discreditable speech" he had ever heard in Parliament, have naturally had their effect in inspiring the young men who have been accused to lie down under Mr. Balfour's occasional insolences.

In its first six months the Campbell-Bannerman Government has undeniably accomplished much, even though its most important measures, the Aliens bill, the Education bill, and others, are still in the hands of the Lords. The Government has learned to map out a firm line for itself, and to stick to it. Its foreign policy has pleased Conservatives and Liberals; and its plan for army reform, however much it may be attacked in detail, is plainly along the right lines. Turning to the navy, it has shown its willingness to limit construction; in India its policy is one of reform and of home rule. For its general attitude of peace and good-will towards other nations, credit must largely be given to Campbell-Bannerman. Hence every one must rejoice that the Prime Minister is at length receiving due credit as a statesman, a scholar, and a popular leader.

WERE THE NEW SPELLING GOES.

The press, especially in England, has displayed surprising heat over President Roosevelt's adoption of spelling reform. It seems to be the idea abroad that from this hour every American child is to be taught the new style; that every printing office throughout—or "thruout"—the country will laboriously adapt itself to the Carnegie Board's dicta. "It is rather odd," says the London *Speaker*, "that the American system of government should lend itself to small monstrosities of tyranny that would never be tolerated in Russia or China." In the same tone the *St. James's Gazette* asks: "Could the Czar venture to do such a thing, or even the Kaiser?" Probably not; but it can do no harm to pause long enough to consider just what "such a thing" is, and what are its implications.

Grant that the new spellings appear in the bulk of the Government publications. Now, the Government Printing Office is the largest establishment in the world. Its output is widely circulated gratis, or at nominal prices. Seemingly, this vast number of books and

pamphlets ought to leaven a large lump of unregenerate national literature. Yet there is one peculiarity about Government publications which makes them an almost negligible factor in the fixing of orthography. People do not read them at first hand. Let any one of us consider how many pages of Government print he has ever actually read. Some people religiously go through the President's message every year, but they read it in the newspapers. This year a few newspapers will print the message as it is spelled, in order to show their readers what it looks like; but when the novelty has worn off the newspapers will treat the President's utterances as they treat all other contributions and dispatches—follow the office "style card." Exactly the same thing will be done with reports of Cabinet officers. So far as the general public is concerned, it would not matter much if they were sent out originally in runes, or "New York point" for the blind, or the Morse telegraph alphabet. The newspapers would translate them, and not one American in a thousand would ever know what the original spelling and capitals were. The "Statistical Abstract," which is a generally consulted reference book, is composed mainly of numerals which no one wants to reform. The *Congressional Record* has readers, of course, among curious constituents and those personally interested in legislation. Yet even supposing that everybody who gets a copy reads it—a somewhat daring assumption—it would still reach no more people than the *Courrier des Etats Unis* or the *Clipper*. No one would suggest that the use of reformed spelling in *The Foolish Book* would be a potent way of spreading it, yet that periodical goes to nearly twice as many people as the *Congressional Record*. Moreover, Congress has not yet voted to make the *Record* conform to the President's order for publications of executive departments.

Nevertheless, there are Government books which are read, so to speak, in their own right. Nearly all of them are publications of the Department of Agriculture. The report of the Superintendent of Documents shows that the Department year-book leads all others in favor. Then follow the "Special Report on Diseases of the Horse," the "Special Report on Diseases of Cattle," "Bulletin on the Honey Bee," "Bulletin on Chemical Composition of American Food Materials," and so on. Here is the field in which—if the Secretary of Agriculture so wills it—Presidential spelling may have most sway. The farmer's natural inclination toward phonetic spelling has for many generations been a cause for mirth. Whenever he reads about anthrax and ring-bone and the ginseng plant, and the way to make bread and the way to exterminate cabbage rot, and—as we were tempted to say—"whether pigs have

wings," he will rise up and bless the President who brings the mysteries of spelling right down to the soil.

Our Government has had one practical experience in a tussle with language. The Board of Geographic Names has for many years been making lists of approved spellings and pronunciations for the names of places. It has done great service in securing uniformity and correcting preposterous usages. But it has never been able to enforce its ideas a foot beyond the line marked by regular custom. In many foreign instances it has announced preferences for names supported by arguments of analogy, etymology, and history. But it has not brought them into use outside the publications which are under obligations to accept its findings. There is no reason for expecting a different outcome in the contest over a broader issue.

In short, an analysis of the scope of the President's order merely confirms what various critics had already said would, on general principles, be the progress of spelling reform. A new spelling will be tolerable only if it is promulgated under weighty literary or academic auspices. For example, the reformed spelling of German gained its partial victory because a number of academic periodicals simultaneously agreed upon its adoption. If the British and American quarterlies and three or four great London publishers can be converted, a real start will have been made. Without such backing, newspapers will be exceedingly reluctant to adopt it because they will see no advantage in irritating and alienating readers. Thus most people will rarely see a page a year in the "new style" unless they go out of their way to observe it as a curiosity. The wonderful "model" which, with the Government imprimatur, was to change all our spelling, will really be before the eyes of few except Government employees. The President's adherence to the movement will advertise it, and, so far as advertising can help, will help it. But spelling and grammar and the meanings of words are fixed, not by the edicts of Presidents or even of dictionary-makers, but by the slowly but steadily changing common consent of all who use the language.

ART LIBRARIES.

The report of the librarian of Columbia University contains the interesting announcement of an intention to build up a department of fine arts. Edward R. Smith, in charge of the Avery Architectural Library, declares that since Columbia is to have an art faculty and to be the centre of art study, the need of an appropriate library is pressing. He makes an appeal for a sufficient endowment for this purpose, since the general funds do not suffice, and it is un-

dignified to beg from pocket to pocket. With his plan we are in complete sympathy, though the matter of parallel enterprises, dismissed summarily by Mr. Smith, deserves a certain consideration. And it cannot be held that the appeal is premature, even if the art faculty of Columbia is still largely on paper; for the library must precede the professor; without it his work is vain, without him it may do useful service. Furthermore, to build up such a collection of books is in some ways more of a task than to recruit a teaching force; hence the mooted of this project is wholly in order.

Several institutions are, it is true, pursuing a parallel and possibly competitive course. The Public Library has a large general collection of art books, not to mention the fine collection of modern etchings, given by the late Samuel P. Avery, and a small but choice collection of Japanese color prints and illustrated books. Mr. Weitenkampf, the curator of the print-room, has also begun collecting all manner of facsimiles of paintings, is exhibiting an important loan collection of photographs of Italian paintings, and means to expand this reference library of facsimiles as fast as funds are provided. The Metropolitan Museum, primarily for the use of its staff, but also for public service, has brought together an art library of more than 10,000 volumes, and this autumn makes a beginning upon a comprehensive collection of photographs of paintings. The Cooper Union, besides a general collection of books, has a remarkable array of albums running into the thousands, in which all manner of prints illustrating the industrial arts are systematically classified. Clearly, if the Columbia Library is to extend its scope to include all the arts, it must in a large degree duplicate the work of three existing libraries. One naturally asks, then, if, by some measure of co-operation and division of labor, this overlapping could not be avoided.

In the main, probably, each library must run its own course. The Public Library evidently must continue to seek completeness in this as in all other departments; the Metropolitan Museum, the best provided, financially, of all, cannot well abridge its plans; the Cooper Union has its work in the arts and crafts inexorably laid out. In other words, any adjustment must come chiefly from Columbia, whose art library is yet to make. The problem of articulating its new facilities with those in other parts of the city will tax the ingenuity of its library staff, and perhaps bewilder its readers. Possibly, Mr. Smith's plan of frankly disregarding the other libraries may in the end prove the simplest. Obviously, the professors of the university schools of art will need a working library on the spot, and between a working and a compre-

hensive collection it is difficult to draw the line. At certain points, however, Columbia might do well to depend on the other libraries.

For example, the print-room of the Public Library has got such a start that an attempt to rival it would be unfortunate. A donor with fine prints to put at the disposal of the public would be foolish to give them elsewhere. Similarly, the assembling of photographs of paintings is so obviously a necessity of the Metropolitan Museum that students will naturally look to it for aid in that regard. We are, however, ready to believe that select collections of photographs, both at the Public Library and at Columbia, might also perform a useful educational and pedagogical function. It is clear also that, provided the money were given for the purpose and not withdrawn from other projects, sheer duplication would to a certain extent be no disadvantage, but rather a benefit. Yet three such complete collections would surely be in the nature of a luxury. Generally speaking, no librarian should be at pains, perhaps at the sacrifice of other activities, to repeat a work already satisfactorily done by a colleague.

In the whole matter of studying art history Columbia will undoubtedly find that the Metropolitan Museum is its best auxiliary. Lecture courses of a general sort will naturally be given at the university itself, and books and illustrative materials for such courses, besides the working facilities we have already mentioned, must be provided on the spot. But the art faculty will, we believe, find that research courses can best be conducted in connection with the Metropolitan Museum, and perhaps actually under its roof. There is already a sufficient community of interest between the Museum and the University to make such an arrangement feasible, and as the staff of the Museum is increased and strengthened, Columbia will naturally draw on that supply for her lecturers. If Columbia finds an æsthetic Carnegie who insists on setting up a comprehensive art library, a print and photograph department, and a lantern-slide laboratory, nobody can blame her for accepting the offer. But for immediate and practical purposes it seems that both the Metropolitan Museum and the Public Library should be reckoned among academic facilities for the study of the history of art.

THE CURRICULUM FOR GIRLS.

To temper the wind to the shorn lamb seems to be the desire of most people who are concerned about the education of girls. But lambs have a habit of growing out of a tender and protected youth into an age which is forced to weather storms. The training of young people is always a deal in futures. To educate girls by a method adapted to give them uninterrupted pleas-

ure between the ages of sixteen and twenty, and to spoil them for any satisfactory living after they are twenty-five, is a curiously shortsighted policy for people of intelligence. A wiser undertaking for girls' schools would be to abandon experiments on the wind and to provide their lambs with a warm fleece, sure to become pleasant and easy to wear, as its power of defence against the blasts of human life is proved.

Since misunderstandings are so rife, it may be well here and now to introduce a caveat and say that rigorous intellectual training does not involve either overwork or failure to recognize the place of recreation and social pleasure in the scheme of education. Under existing circumstances, however, girls suffer less from overwork than from misdirected work. Parents who wish to give their daughters serious mental discipline, something more than the most superficial graces and accomplishments, are often at a loss as to which way to turn, what school to choose, what curriculum to plan. This bewilderment is not surprising. Even women's colleges, we must admit, are not invariably of the sterner mould, although in general they have united to make genuine discipline an important part of girls' education. Some few schools are glad to follow suit; but probably they would be the first to maintain that strong opposing influences make their task difficult. Defects in the preparation of girls for college are still obvious. This, however, is but a limited aspect of the wider truth that there are defects in the methods of preparing girls to carry on a life that shall be in the least satisfying to themselves or to any appreciable degree useful to the rest of the world. Whether the fault lie chiefly with the college or with the school, or even with the parents, is not the present question. While they are quarrelling over Patroclus's body, we discuss the situation as we find it. The correct apportionment of responsibility would better follow than precede a consideration of the vital issues.

The chief cause of confusion and wasted energy is the line commonly drawn between those girls who are going to college and those who are not. This division is about as senseless as an early division of infants according to their future tastes in foods. A preliminary milk diet is inevitable for them all. We need not erect this figure of speech into a formal argument in order to urge that the same preliminary training between the ages of fourteen and eighteen, if it be sound and sane, should be equally good for all girls, whether they are going to seek the shelter of college, or, heedless of further provisioning, make at once for the open. To say this is not to entertain the roseate view that the present college requirements are ideal. But probably they need only modifications, enlargements here and retrenchments there, rather than any complete transformation. Even as they stand, they demand nothing unreasonable of any intelligent girl, however pretty, and nothing that any intelligent woman, however charming, should not be able to look back upon as part of the spoils of youth, and to use as part of the possessions of maturity. These college requirements, as

set forth in the technical language of the school programme, sometimes strike the layman as a terrifying mystery; but they are, in fact, extremely simple. A modicum of English for self-respect, a modern language or two to help one farther afield, something of an ancient language to show that "it is we, and not the world, are new," a little history to make the sky line more remote, a few facts of mathematics to keep the mind clear, and a hint of science to reveal a world of law—surely these are by no means over-heavy accoutrements even for women who are going to be unlabelled members of society. Yet they are the only ones which colleges demand of their new recruits.

The mere enumeration of these requirements is sufficient proof of their importance in the intellectual equipment of every girl who aspires to anything beyond childish acquirements. They are obviously the irreducible minimum. Indeed, the only plea for offering a different course to students who are not going to college is that the rigid preparation required for college leaves no time for the pursuit of other desirable subjects from which those should not be debarred to whom school is the last educational opportunity. This plea, however, is based on the curious theory, unchallenged because unexpressed, that no woman (or man) acquires knowledge after twenty-two, and that a larger proportion of women reach at eighteen the end of acquiring. Anything, therefore, that a human being may conceivably need at any future time must be secured before that age; for outside the portals of the school house and beyond the teacher's bell, minds are never stirred by curiosity or impelled to find out the unknown. The working of this fallacy among college students results in their desire to take every subject announced in the catalogue; and among school authorities, in foisting into the curriculum such things as political economy, "mental philosophy," and art criticism—subjects as many and as diverse as the ingredients of a nonsense rhyme. We forget that there will be many a brave year after the traditional four or eight of school and college, when the treasures of this world may be exploited by minds made keen and supple through a simple and coherent training. Whether the bell rings for the last time after school life or after college, it should usher out young men and women who are not arrogant vaunters of scraps from the ragbag of knowledge, but who, because they know, in proportion to their youth, a few fundamental things accurately, will answer a humble, hopeful, and eager *adsum* to the peremptory call of greater masters.

One of the evils resulting from the existence of two school courses side by side is that the preparatory course is made to seem an unnatural thing, taken for no more rational reason than to pass examinations irrationally set by erratic colleges. Parents therefore hesitate to plan to send their daughters to college because it means separating them at an early age from what they understand "educators" regard as the best training for the normal girl. Even bright girls, who take natural enjoyment in a moderate amount of study along with their play, grow so tired of hearing college

talked about in school and of having all their work portioned off as "preparatory to college" that they revolt from the idea and prefer a course in which they are not a target for constant nagging.

Thus it often happens that a girl's decision to go to college comes late. Within a year or two of the proper time for entrance she decides that, after all, college is too fine an experience to be thrown away. Certain requirements must be met, and she is put into the incubator. If any regard is had for her physical and mental health, she is allowed to cover the ground with just sufficient thoroughness to pass, creditably enough, her examinations. This procedure is manifestly unjust to the college preparatory course, robs it of much of its disciplinary value, and incidentally strengthens in the minds of the girl and her parents the suspicion that it is arbitrary folly. Really to educate her mind to the stage proper for her years, and really to equip her for handling the substance of knowledge and of life as it is to be later presented to her is of course impossible. That kind of training is a slow process and its starting point must be placed much farther back. As for the schools and the teachers who allow long hours and nervous strain to take the place of learning, and who make a contemptible travesty of education by setting the goal of mere high marks to be won by anæmic girls—they deserve the heaviest millstone and the depths of the deepest sea.

With this anathema kept ready against the only real offenders, we may revert to the main point, the only point of great moment—the thesis with which we began. It is simply that students should be taught what it is to work hard. The greatest wrong done to girls lies in giving them no chance to follow out, firmly and severely through a long series of years, a course of intellectual and moral development. They are cheated out of seeing that fair sight, the smile upon the face of duty. We are so afraid of making them into the most pitiable of God's creatures—women of shattered nerves—that we deprive them of that healthy enjoyment of sane work, combined with a sane enjoyment of healthy play, which keeps a girl well and normal. A splendid vitality can be preserved in unison with work which clears the brain, strengthens the will, and enlarges the capacity for cheerfulness, quite as well as in unison with continuous pleasure-seeking which befogs the intellect, weakens the fibres of character, and tends toward restlessness and disillusionment. We are so afraid of making girls into the most useless of God's creatures—women lacking grace, gentleness, and human sympathies—that we deprive them of that absorption in larger interests outside themselves which quickens their perfect adjustment in all social relations.

In reality our need for girls to-day is schools which, while they do not scorn health and manners, will keep them as equerries in the train of hard thinking and sturdy living; schools which will establish traditions and methods of discipline and training, and keep to them though the heathen rage; schools which will prepare for college, if that is to be our terminology, not spasmodically or with difficulty, but steadily and with the inevitable ease of rigorous perseverance. A few such schools, it must be repeated, have already

come into existence. What they need is the support of public sympathy. Let us talk less about shorn lambs, and, with an eye to the inexorable winds, help to make ready the fleeces.

A. C. E. ALLINSON.

Providence, R. I.

LONDON BOOK NEWS.

LONDON, August 22.

August is usually a month when publishers and authors, like the dog mentioned by Quilp, are "lurking for a spring," and are not actually springing anything on an eager public. Madame Buchholz, we know, in a holiday and season of entire leisure, began to read Humboldt's "Cosmos," but, after two trials, discovered that she "had no time," and that, after all, it did not matter how high the mountains are in Colorado. It has usually been taken for granted that in their holidays people have no time to read. On the other hand, when they are in town, they certainly have no time (I speak of the women), for they have to pay visits, and the dressmaker is "the thief of time." In the holidays they are far from their dressmaker, and, in dreary lodgings and hotels, on wet days, they are often seen with books in their hands, and melancholy throned on their brows.

Thus a wise popular novelist will choose "the dead season" as the very best season for publication. Our two most eminent creative minds have done so, and a new novel by Miss Corelli is in the hands of all. Decorated with a portrait of the fair author, this volume appeals to the bibliophile no less than to the mere student. With the portrait of Hall Caine we are already familiar, and I think none is given in his new romance, sold at sixpence, and appealing to our romantic instincts under the engaging title of "Drink." A lady in the narrative does not drink to us only with her eyes, as the temperance poet, Ben Jonson, requests a fair one to do, but is even too convivial. The publishers inform us that "the love story is enthralling," and that the work is "as important as a sermon, and as sensational as a detective story." Doubtless this novel will be criticised in the *British Journal of Inebriety*, a convivial review which lies on the table of a public library frequented by myself, beside the *Revue de l'Histoire des Religions*. The pages of both are usually virgin of the paper cutter.

Except for the two masterpieces mentioned, little or nothing is being published. As if one *Life of Walter Pater* were not enough, Thomas Wright promises a successor to the critical study by Mr. Benson. "It will be in many respects the most valuable work that has proceeded from his pen." His publisher says so, and his publisher ought to know. We are to be told much about "the early Paters," who lived at Olney, celebrated as the birthplace of the Olney Hymns. Information is also promised about Richard C. Jackson; all of it will have the merit of absolute novelty to readers hitherto ignorant of Mr. Jackson's life and adventures, while Richard Robinson's career will not be neglected. Concerning Mr. Pater's friendship with these eminent men "no previous writer has recorded a single word."

Personally I look forward with more excitement to a new book by the ladies who

wrote "The Reminiscences of an Irish Resident Magistrate," a book of genuine humor, and of much unobtrusive literary skill. "Some Irish Yesterdays" is the title: few people can write well about Irish life, but we are safe with "E. Somerville" and "Martin Ross." Again, "The Life and Letters of Leslie Stephen" is sure to be much better worth reading than most *Lives and Letters*, as Sir Leslie was a truly original character, who had known all distinguished people of the literary world since Thackeray. The author is F. W. Maitland, a writer who can give vivacity to the history of early mediæval institutions, a topic which certainly needs enlivening. How Augustine Birrell is to find time for a book on Browning, only very busy men can imagine.

There is a proposal to found a "Titmarsh Club" in honor of Thackeray, but there are already so many literary dining clubs that one more seems a superfluity of conviviality. The best are those in which it is forbidden to make speeches, but none are to be called very amusing, and at a Rabelais dinner one yet felt as if one were celebrating the memory of Blair, author of "The Grave."

ANDREW LANG.

Correspondence.

NAPIER'S LOGARITHMS.

TO THE EDITOR OF THE NATION:

SIR: How did Napier work his logarithms? Who can tell? Some years ago I reviewed a book in which Lord Napier's great invention was treated, but his method not set forth. I raised the author's anger by trying to supply the gap from what as a boy I had seen in an old German book (Vieth, 1804). Napier, he said, drew square roots consecutively; say, trying to get the logarithm of two, he would twenty-seven times draw the square root, thus finally arriving at the 134,217,728th root of 2, which is = 1, then a decimal point and 8 ciphers, then 8 telling digits, all the root-drawing having been carried to 16 figures. For a quantity of this sort we may say $\log(1 + \omega) = \omega$ within the decimals used. Multiplying the eight telling digits by 134,217,728, they will from places 9—16 drop into places 1—8, and the result = $\log \text{ nat } 2$. The author, though rejecting my statement, did not give any other in place of it; and he set me to searching.

I knew all along that Napier's logarithms, being those of sines or of tangents for arcs less than 45° , were all negative; also that his seven places were not marked as decimals; and thus we might say that though his logarithms were at bottom "natural," he, in form at least, used the modulus —10,000,000. At the first opportunity, stopping at Washington on business, I looked up the "Mirifici logar. canonis descriptio" (1614), in the Congressional Library, and found to my surprise that Napier's logarithm for $\sin 30^\circ$, i. e., of $\frac{1}{2}$, is 6931469, though $\log \text{ nat } 2 = .69314718$. So his logarithms are not natural at all, and could not have been reached by the method which Vieth describes. The "Constructio" (1617) is not in the Library and I could not get hold of it. I looked the matter up in some histories of

mathematics (e. g., Hutton), but found no clue; I then consulted the Encyclopædia Britannica, and this (art. Logarithms) gives Napier's modulus at—10,000,000, which is *wrong*. Taking further notes from the "Descriptio," I found $\log \sin 1' = 81-425681$, while $\log \text{nat} \sin 1' = -8.1425717$, a difference of 36 in the last two decimals. I found likewise Napier's $\log \tan 30^\circ = 5493-059$, while $\log \text{nat} \tan 30^\circ = \frac{1}{2} \log \text{nat} \frac{1}{3} = -5.4930614$. These three instances, which I found confirmed by another, and which are undoubtedly in harmony with all the rest of Napier's table, show that his modulus is not—10,000,000, but pretty nearly—9,999,995.6 (9,999,995 and six-tenths, negative).

How did he come by this modulus, either consciously or unconsciously? Is there any one of your readers who can tell me?

L. N. D.

Louisville, Ky., August 28.

Notes.

Some of the more important of the autumn announcements of Houghton, Mifflin & Co. have already been mentioned in this column. Other books that promise special interest are: "Walt Whitman," by Bliss Perry; "Charles Godfrey Leland," by Elizabeth Robins Pennell; "Mémorial and Letters of Frederic Dan Huntington," by Arria S. Huntington; "My Pilgrimage to the Wise Men of the East," by Moncure D. Conway; "Through Man to God," by George A. Gordon; "Atonement in Literature and Life," by Charles A. Dinsmore; "Christ and the Human Race," by Charles Cuthbert Hall; "Realities of Christian Theology," by Clarence A. Beckwith; "The Hebrew Literature of Wisdom in the Light of To-day," by John F. Genung; "Ecclesiastes in the Metre of Omar," by William B. Forbush; "Friends on the Shelf," by Bradford Torrey; "The Higher Study of English," by Albert S. Cook; "The Poetry of Chaucer," by Robert K. Root; "Books, Culture and Character," by J. N. Larned; "Talks on the Teaching of Literature," by Arlo Bates; "Le Plutarque de Montaigne," by Grace Norton; "From Old Fields," a posthumous volume of poetry by N. S. Shaler; "The Practice of Diplomacy," by John W. Foster; "Progress in the Household," by Lucy M. Salmon; "The Struggle for a Free Stage in London," by Watson Nicholson; "Organized Democracy," by Albert Stickney; "Studies in Philosophy and Psychology," by Charles E. Garman; "Pure Design," by Denman W. Ross.

Among the autumn announcements of Little, Brown & Co. are: "Mars and Its Mystery," by Edward S. Morse; "Starting in Life," a guide to the selection of a business or profession by Nathaniel C. Fowler, jr., and others; Lillian Whiting's "From Dream to Vision of Life," uniform with "The World Beautiful"; "Last Verses," by the late Susan Coolidge; "A Handbook of Polar Discoveries," by Gen. A. W. Greely; "Buff: A Tale for the Thoughtful," a popular work on the common sense of health "by a Physiopath"; "The Stars and Stripes and Other American Flags," by Peleg D. Harrison; "The Economy of Happiness," by James Mackaye; "The Syllogistic Philosophy," by Francis E. Abbot; "An Atlas

of Physiology and Anatomy"; "Forget-Me-Not," a book of selections for daily reading by Anna Mellen Stearns and Clara Bancroft Beatley; and "Paul the Apostle," as viewed by a layman, by Edward H. Hall.

Doubleday, Page & Co. will soon have ready "The Pursuit of Happiness," a series of essays by Dr. George Hodges, dean of the Episcopal Theological School of Cambridge, Mass. Another book to be published by the same house is Homer B. Hulbert's "Passing of Korea." Mr. Hulbert was the special agent of the Emperor of Korea to this country to protest against the usurpation of Japan in the peninsula, and his work is a thoroughly sympathetic study of the land, not without glances at the Eastern question as it is there developing.

D. Appleton & Co. are publishing "The House of Islam," a novel of Turkish life by Marmaduke Pickthall, the author of "Saïd, the Fisherman." Other books on their autumn list are: George Moore's "Memoirs of My Dead Life"; Albert Abend-schein's "Secrets of the Old Masters," and Charles F. Thwing's "History of Higher Education in America."

Henry Frowde announces these books as in the press: "The Theory of Good and Evil," by H. Rashdall; "Hyperides" (Oxford classical texts), edited by F. G. Kenyon; "Tacitus Annals" (Oxford classical texts), edited by C. D. Fisher; "Oxford Anthology of English Literature," by G. E. and W. H. Hadow; "Cæsar's Civil War," translated by F. P. Long; "Knuth's Flower Pollination, Vol. II," translated by J. R. Ainsworth Davis.

Two new volumes in the Scriptorum Classicorum Bibliotheca Oxoniensis may be named here without attempting to criticize the construction of the texts: Longinus "De Sublimitate," edited by A. O. Prickard, and Plato's "Euthyphro, Apologia, Crito, and Phædo," edited by John Burnet.

Mrs. Russell Barrington has prepared "The Life, Letters, and Work of Frederic Leighton," which will be published in the autumn by George Allen, London. Mrs. Barrington has had access to the papers and correspondence of Lord Leighton through the assistance of his sister and other members of his family, and the volumes will contain his diaries and letters. Among his correspondents were George Eliot, Ruskin, Browning, and Dickens. Other books of interest in Mr. Allen's autumn list are "Lord Acton and His Circle: Letters to Various Correspondents," edited by Abbot Gasquet, and "Sir Thomas Lawrence's Letterbag," edited by G. Soames Layard, with the unpublished recollections of the artist by Elizabeth Croft.

Thomas Whittaker is the American publisher of "A Mission of the Spirit," being a series of addresses delivered last Lent during a progressive mission in his diocese by the Bishop of London, the Rt. Rev. A. F. Winnington Ingram.

Herbert B. Turner & Co. are about to publish "The Historical Bases of Religions: Primitive, Babylonian, and Jewish," by Hiram Chelliss Brown. It is an attempt to explain the religious sense from purely natural and historical causes.

T. E. Thistelton-Dyer has prepared what he calls the "Folk-Lore of Women," which

is to be issued this autumn by A. C. McClurg & Co. It is, in brief, an anthology of what men have written and said about women—a large subject.

We are soon to have a new anthology, "A Pageant of Elizabethan Poetry," selected by Arthur Symons. The period is from Spenser to Herrick, and the arrangement is not chronological, but by subjects.

The University Press of Sewanee issues Emerson's "Essay on Compensation" in a neat pamphlet, with an introduction by Lewis Nathaniel Chase.

"Foilbes of the Bar," by Henry S. Wilcox, will be published by the Legal Literature Company of Chicago, October 1. It is a companion volume to "Foilbes of the Bench."

Beginning September 7th the *North American Review* will be issued as a fortnightly magazine. It will contain a new department devoted to the criticism of current literature. Ninety-one years ago the *North American* started as a quarterly. Sixty years later it became a bimonthly, and for a generation it has been a monthly. Henceforth it will be published on the first and third Fridays of each month.

The new *Putnam's Magazine* will be published on the 25th of September, and on that day of successive months.

We have before us a reprint of Richard E. Helbig's "Deutsch-Amerikanisches in der New York Public Library" from *German-American Annals*. It gives an account of the recent increase of material in the library on a subject which is attracting more attention every year.

A new volume of the Mermaid Series (imported by Scribners) contains four plays of Farquhar's with an Introduction by William Archer. This completes for the series the four leading "comic dramatists of the Restoration," to use Macaulay's grouping. It is to be remarked that in several cases the new format of a well-known series is by no means as agreeable as the old. Thus the new volumes of Bohn's library are without character, and in every way inferior to the old. The Mermaid texts are now issued in those thin-paper editions which are the detestation of most good book-lovers. Other series might be named which have put on a new and inferior dress.

All who love Mr. Hardy's novels will welcome the new edition of Dr. Windle's "The Wessex of Thomas Hardy" (John Lane Co.), which was reviewed in these columns on its first appearance five years ago. The present edition is unchanged as regards the contents, but is made up in a rather smaller volume, which is very attractive and light in the hand. E. H. New's charming illustrations, though occasionally too much of the "decorative" order, as one expects from a disciple of William Morris, have for the most part the sombre beauty which is appropriate to pictures of Wessex, that background of tragedies.

Painstaking care and a kindly spirit rather than a style which will appeal to readers characterize the Rev. Bridgeman C. F. C. W.-Boughton-Leigh's "Memorials of a Warwickshire Family" (Henry Frowde); and much the same care has marked the

production of the book, which is an example of the University Press at Oxford at its best. A kindly and appreciative spirit runs through this story of the Leighs and the Boughton-Leighs, which is specially noteworthy in the treatment of the Baptist Chapel at Rugby and of one of its pastors, the Rev. Edward Fall—noteworthy because usually when clergymen of the Church of England are writing of any of the Free Churches such notice as the author bestows on the Baptists of Rugby is not the rule. Sir Egerton Leigh, Bart. (1762-1818), was, however, of the Baptist Church. He preached for many years at the chapel at Rugby and often in the open air; and a baronet in the pulpit is about as uncommon in England as a territorial family which is not of the Established Church. Warwickshire is the home county of the Leighs; and as the churches and mansions of twelve Warwickshire villages and towns, including Rugby, are described, these "Memorials," apart from their genealogical and family interest, are an addition to the local literature of the show county of the Midlands, and for that reason likely to appeal to a larger audience than that immediately concerned with the history of the Leighs and the Boughton-Leighs. The illustrations are particularly good, and contribute in a high degree to this wider appeal.

We have reached a period where we may well employ very critical standards as to data on the Philippine Islands. We are therefore unable to find much justification for the new edition of Foreman's work on those regions ("The Philippine Islands," by John Foreman; imported by Charles Scribner's Sons), a large volume of about 650 pages. Mr. Foreman, who was for some years before the end of Spanish rule engaged in introducing into the Philippine Islands English machinery for tropical agriculture, published in 1890 a treatise on those islands, occupied mainly with the data he had gathered as to sugar and other cultures, observations on his trips through the islands, and a bad hodge-podge of information and misinformation in a number of chapters on the history of the islands. The author had collected a jumble of data, often garbled, from Father Concepción and one or two other friar-chroniclers. In recent years no treatise on the Philippines had been published in English except translations from German and Spanish originals. Hence, Mr. Foreman was accepted as the English-speaking authority on the Philippines and was invited to enlighten our peace commissioners at Paris in 1898. The next year he brought out a new edition of his book, which had a large sale in the United States, and which in consequence gained an undeserved reputation. It has been quoted regularly since 1899 as authority for many remarkable untruths as to Philippine history (especially that of the rebellion in 1896 and subsequent events). To this 1899 edition, the original imperfections and the many vital errors of which are nearly all left uncorrected, Mr. Foreman has now, besides expanding somewhat the chapters on the Filipino rebellion against Spain, added eight chapters on the war with the United States and the American government of the Philippines, 1898-1905. In these new chapters he has corrected the wildly exaggerated statements he made in the *Contemporary Review* for

September, 1904, but errors abound, and the omissions of vital data or events are frequent and sometimes more serious than the errors. A good review of American occupation of the Philippines is a desideratum, but such a work as this is of scant value to anyone.

Admirers of Thomas à Kempis cannot fail to be interested in J. P. Arthur's translation of his lives of Gerard Groote and his followers, and his "Chronicle of Mount St. Agnes" (London: Kegan Paul). Mr. Arthur has called his rendering of the lives, "The Founders of the New Devotion," the New Devotion being the name given to the religious movement, started in Holland by Master Gerard Groote (Gerard the Great) in the latter half of the fourteenth century. Gerard's object was the restoration of piety and morals, then sunk grievously low, and partly with this view he and his disciple, Florentius Radewin, planned the formation of societies known as "Brotherhoods of the Common Life," the members of which were to live together, but without taking vows, to support themselves by their own labor, and to devote much time to prayer and work for the poor. Sisterhoods were also formed on the same pattern. That these communities might not lack advice and assistance, regular monasteries were also founded. Among the earliest were those of Windesheim and Mount St. Agnes near Zwolle. This latter à Kempis entered as a young man, having received his previous training at the town school at Deventer, where Florentius and the house of the Brotherhood of the Common Life exercised great influence. A special interest thus attaches to Thomas's account of the Brothers and their institutions, and it is not a little surprising that his works on the subject have only now been rendered into English. The Rev. S. Kettlewell in his "Thomas à Kempis and the Brothers of the Common Life," contented himself with translating selected passages.

The title of President Henry Churchill King's "Letters to Sunday School Teachers" (The Pilgrim Press, \$1 net) is misleading. It has nothing to do with religious instruction through the Sunday-school, nor with the principles and methods of teaching, but is concerned rather with doctrines and belief. It is a sort of primer in dogmatic theology, and should be classified in the library rather under Doctrinal Theology than under Sunday-schools. These are certainly sad, degenerate days, when our dogmatics come to us in pretty green and white booklets, declivity-edged, and paged at the bottom. How must the shade of the angelic Thomas move at the suggestion that this trifle be placed under the same category as his portly tomes! Calvin maintained the dignity of the queen of sciences, Pearson expounded the creed with proper gravity, and Hodge brought down mysteries from high heaven in three-volume ponderosity; but here we have the "great truths" of God and the soul made clear and satisfying to uninstructed minds in a few score, wide-margined pages, daintily covered in green and white. It is said that eminent divines occasionally preach in simple churches near their vacation residences clad in the negligée of the golf course rather than in the habiliments of the pulpit, and that

the sermons are not altogether bad. Similarly with President King's *Summa Theologia*, its dress is certainly negligée, but its matter, so far as its modest limits allow, is not so bad. To be sure, the doctrine is not uncomfortably orthodox, but it is sincerely religious, and has the warmth of real piety. It endeavors to trace the way from the surest realities of experience to positive and satisfying religious convictions.

Parts 5 and 6 of Prof. Angelo de Gubernatis's "Dictionnaire International du Monde Latin," have followed each other so quickly that the work is completed in less than two years since it was begun. It contains over 1,500 double-column quarto pages, carrying some 10,000 biographical sketches. The editor regrets, in the final part, that many of the sketches are fragmentary, owing to the failure of their subjects to furnish adequate data, but he promises to make good this deficiency, so far as possible, in a supplement to be issued before the end of the year, and to comprise also corrections and a general index. This supplement will be sent without cost, except one lira for postage, to the original subscribers to the work; to others, the price will be seven lire. Professor de Gubernatis has produced a book of reference unique in scope and of permanent value. He has further given his subscribers nearly 50 per cent. more than he promised—an unusual instance of editorial generosity.

A much disputed point of recent history seems ready to be elucidated. Why was France left without allies to aid her at the beginning of her conflict with Germany in 1870? The revival of the controversy dates from the visit in July of ex-Empress Eugénie to Emperor Francis Joseph; which was said, very improbably, to have for its object the restoration of a letter written by the latter to Napoleon the Third shortly before the declaration of war and promising assistance. In 1878 Prince Napoleon accused the diplomacy of the French Empire of incompetence under the circumstances. Gen. Türr, the *alter ego* of Garibaldi, replied by stating that he had been as aide-de-camp of Victor Emmanuel a confidential agent in secret negotiations, from 1864 to 1869, for the formation of a Franco-Austro-Italian alliance to counterpoise the disquieting growth of Prussia; like every one else he then attributed the failure of the proposed alliance to Napoleon the Third's unwillingness to hand over the Pope and Rome to Victor Emmanuel. Emile Ollivier, French minister at the opening of war, now extracts from a forthcoming volume of his "Empire Libéral" documents showing that, among other things, the Emperor's Roman policy was his own, and not imposed on him by the Empress. Gen. Türr now adds to his former statements that he is certain the proposed Latin League against encroaching Pan-Germanism was rendered impossible by the intrigues of England and Prussia. The controversy, among these surviving political actors of the time, has become so heated that both Marquis Visconti-Venosta and Count Nigra, who was Italian Minister at Paris, announce the speedy publication of their own authoritative memoirs.

The lady who has so recently made a reputation under the name of "Pierre de Cou-

levain," is apparently determined to live up to the time-honored adage of making hay while the sun shines. Her new book, "L'He inconnue" (Caimann-Lévy), shows signs of being old material hastily put together for publication to catch the present wave of Anglo-French cordiality. The unknown island is England, and the author's treatment strikes about midway between Max O'Rell and Emile Boutmy. A love story is woven in, and there are many clever observations, but the style is slipshod, and the pruning knife has not been used. The author has so much real talent that she can afford to produce a little more slowly and more carefully.

It is a sign of the times that a Brazilian should write a book in French and send it to an American weekly for review. His Excellency Sen. Nabuco, ambassador of Brazil to the United States, publishes through Hachette a volume entitled "Pensées détachées et Souvenirs." We observe with regret a marked note of disillusion in the book, which we hope does not arise from the nature of the author's duties. It is pleasing to reflect that a diplomat at Washington has leisure to frame moral aphorisms after the manner, if not in the style, of La Rochefoucauld. The diplomatic antagonists of the Brazilian ambassador should not fail to become acquainted with the interesting turn of mind his book reveals.

In our review of Holyoake's "History of Coöperation" the book was credited to the wrong publisher. It should be E. P. Dutton & Co.

Twenty-eight years ago an association was founded for the purpose of defending and propagating the principle of the universal protection of literary and artistic property. Victor Hugo was the first president of the Association Littéraire et Artistique Internationale, which now numbers four hundred members. Its annual congress will be held this year at Bucharest from September 21 to 26, when the question of admitting Rumania to the international copyright union, known as the Berne Convention, will be a leading topic for discussion.

The University Extension summer meeting at Cambridge, Eng., this year was of unusual interest. Large numbers of foreigners were present, America, Germany, Denmark, and Sweden having been especially well represented. Even China and Japan provided students. Among the foreign lecturers were professors from Bucharest and the Catholic University of Lille. Attention was concentrated on the eighteenth century, and though this limitation did not apply to the scientific courses, special note was taken of the great astronomers, botanists, and zoölogists of that century. The most encouraging feature was the representation of the working classes. Three years ago the Workers' Educational Association was formed to promote the higher education of work-people, and scholarships have been provided by it to send some of its most promising students to the summer meeting free of cost. Upwards of sixty delegates of the association attended a conference in Cambridge to discuss how free libraries could be made of greater service in the education of the people.

Professor von Behring, whose tuberculosis investigations are more than ever interesting the scientific world, recently made, to a party of French scientists, a more detailed statement of his achievements than has hitherto appeared. In this he affirmed that he had been able to prepare a fluid named "tulose," differing radically from Dr. Koch's tuberculin, by using which he had been able to check the infection of animals by malignant tuberculosis bacilli. He frankly admitted, however, that he had not yet succeeded in developing a serum similar to the diphtheritic antitoxin, and that he considered the future discovery of such a serum "extremely doubtful." Yet it was not impossible that by further experiment the "tulose" could be made to develop curative properties. Meanwhile, clinical experiments have shown that injections of this new fluid are of value in the treatment of children suffering from either tuberculosis or scrofulous troubles. Finally, Professor von Behring announced that, until further experiments have shown for just what uses "tulose" is best adapted, it will be dispensed only to a few select hospitals and clinics, which will pledge themselves to use it only in accordance with certain conditions prescribed by him. If this calm statement disappoints those who have already seen the white scourge disappearing before Dr. von Behring's magic, it is yet proof that a great scientific advance has really taken place.

According to circular 118, issued by the Harvard College Observatory, covering observations of Phœbe in May and June, 1906, six photographs of Saturn, showing images of Phœbe, have been obtained with the twenty-four-inch Bruce Telescope at Arequipa.

Luther W. Burbank's plant "creations," celebrated as they have become, have not yet added much to the every-day American table. Neither have the foreign plants introduced by the Department of Agriculture. But the two combined are likely to bring to market within the next few years an array of fruits and vegetables almost as varied as that of the tropics. Isaac F. Marcosson, who writes in the current *World's Work* on "Exploring for New Tropical Crops," names a long and wonderful list as within the immediate possibilities. Not only dates, pistache nuts, and citron are well established, but less familiar varieties. The Japanese udo is being introduced as a salad plant, and, cultivated in the Far West, has already been served on New York tables. The Javan mangosteen has been grown in America, and is to be followed by spineless, edible cacti from Spain.

Some important acquisitions have been recently made by various German museums. The Kaiser Friedrich Museum at Berlin has acquired the artist's sketch for the "Good Samaritan," by Rembrandt, at the Louvre; "The Fainting Lady," by Metsu; a "Madonna," attributed to Giovanni Bellini, and a *predella* by Lippo Lippi, with scenes from the childhood of St. Ambrose. The National Gallery at Berlin has acquired a picture of still life by Courbet; the Royal Library at Berlin, a copy of the "Mayence Psalterium" of 1459. The sale of this precious volume to America was al-

ready pending, but a national subscription was raised, and the owner was patriotic enough to accept £4,000 from a German institution in preference to a higher offer from abroad. The Wallraf Museum, Cologne, has acquired "Summer's Bliss," by Hans Thoma; a fine portrait of the artist and his wife, by Steinhausen; and paintings by Robert Haug, J. Bergmann, R. Jordan, and W. Schreuer. Menzel's painting of "Gustavus Adolphus Receiving His Wife at Hanau," one of the few large paintings by Menzel not yet in public keeping, has been added to the Municipal Museum of Leipzig.

The National Portrait Gallery, London, has recently acquired several interesting portraits. A study in oils of Samuel Johnson by Sir Joshua Reynolds for the well-known portrait at Knole, was presented by T. Humphry Ward. A water-color sketch by Charlotte Brontë, drawn in 1850, by her friend, Paul Héger of Brussels, has been purchased by the trustees. This sketch was acquired from the family of the artist about forty years ago, and since then has been in private hands. Another purchase is a small portrait in oils of Edward Gibbon, the famous historian, painted by Henry Walton; it is said to be the best extant likeness of the historian. A chalk-drawing of James Anthony Froude, by J. E. Goodall also figures on the list, as well as a portrait in oils of William Farren, the actor, and one of Samuel Cousins, the mezzotint-engraver.

The "Grande Médaille d'Emulation," offered by the French Government to the student receiving the greatest number of "values" in the first class in the École Nationale des Beaux Arts, has been won by George A. Licht, an American student of architecture. Licht is a "Prix de Paris," and holds a two years' scholarship offered by the "Société Beaux Arts Architects," composed of "Anciens Étèves" of the École in America.

The gold medals at the Venice international exhibition recently ended were awarded for painting to: Camarosa Hermen (Spain); Blanche, Simon, and Jacques (France); Karoly (Hungary); Innocenti (Italy); Larsen (Sweden); Shannon (United States); and Zugel (Germany). For sculpture the gold medal went to Bistolfi, an Italian.

The seventeenth annual exhibition of the New York Water Color Club will be held in the galleries of the American Fine Arts Society, No. 215 West Fifty-seventh Street, New York; opening to the public Saturday, November 10, and closing December 2.

Macmonnies has been appointed the sculptor for a monument, to be erected in Central Park, to perpetuate the memory of Joseph Jefferson. The statue will represent Jefferson in the character of Rip Van Winkle. The work will be life-size, wrought of bronze, and mounted on a pedestal of granite.

William Edgar Marshall, a portrait-painter, whose name once was much more familiar to the public than it is now, died last week, Wednesday, in this city, at the age of seventy-one. Beginning his career as an engraver at Washington, he attracted attention by engraved portraits of President Buchanan and Gen. Fremont. In the fifties well-wishers

sent him to Paris to study. Returning here, he painted portraits of Charles H. Dana and Nathaniel Hawthorne that gave him a reputation. At various times he had such sitters as Lincoln, Grant, Sherman, and Longfellow.

TEXT BOOKS.

"A College Algebra" (Ginn & Co.), by Professor Fine of Princeton, is without a rival among English text-books of college algebra, whether it is judged in respect to style or in respect to spiritual solidarity. Ripe scholarship, patience, conscientiousness, expository power—all these were necessary, but (as the mathematicians say) not sufficient to produce the book. There was needed, besides, a certain just faith that interest and intelligibility are not sacrificed, but are enhanced by a serious regard to the logic of the subject. The result is a work in which algebra is made to appear in its proper character as a genuinely deductive science, as a rigorously concatenated structure of thought on a foundation of explicit assumptions. The treatise falls into two parts. The first (of 70 pages) deals with the number system as such, including both reals and imaginaries. The system as presented includes ideas usually reserved for graduate years. Professor Fine has happily rendered them really accessible to the beginner—an important and difficult achievement. Unfortunately, judgment regarding availability for classroom use will depend upon the habits and attainments of teachers. For Professor Oswald's recent statement that improvement in the teaching of chemistry meets its chief resistance in the inertia of teachers already formed, is, unhappily, valid in every branch of science. In the second part occur several departures from the usual arrangement of topics. These changes were dictated alike by didactic and by scientific considerations. We note especially the early introduction and use of the method of undetermined coefficients; of the "division transformation," and, in connection therewith, the emphasis placed upon the remainder theorem and synthetic substitution; the prominence accorded to the notion of graph of a function, and especially the introduction of that illuminating notion prior to the presentation of Sturm's theorem. On the other hand, as some will think, both earlier and greater stress might well have been laid on the method of mathematical induction. In the later chapters will be found a really scientific presentation of such cardinal matters as infinite series, infinite products, continued fractions, continuity of functions, functional oscillation, upper and lower limits, etc. The merit of these discussions is that the doctrines as presented will not require to be subsequently unlearned—a melancholy process to which the disciple of the traditional text is so cruelly condemned.

C. N. Schmall's "A First Course in Analytical Geometry" (D. Van Nostrand Co.) is a direct and energetic account of the conic sections, including the usual chapter on higher plane curves and a brief introduction to the geometry of three dimensions. The style, while it is in general clear enough, tends not in-

frequently to be a little slap-dash. Some of the demonstrations are excellent, as, *c. g.*, the proof that every linear equation in two variables represents a straight line. On the other hand, the attempted demonstration (p. 298) that "a single equation in three variables represents a surface" hardly supports the author's claim that "all proofs given are rigorous." The author's intention to exalt general method over specific matter is praiseworthy, but it ill consists with an exclusive use of the so-called "secant method" in tangent problems. In this connection it is a pleasure to refer to Candy's "Analytical Geometry," where the intention in question is admirably carried out. Mr. Schmall's frequent use of determinants and the abridged notation of Plücker and Bobillier is commendable, but his use of "sinister" and "dexter" to denote the left-hand and right-hand member of an equation is doubtless unhappy and injudicious. In the matter of nomenclature, it is sheer folly to try to tempt the real mathematician either to be the first by whom the new is tried or the last to lay the old aside.

"A Brief Course in the Calculus" (D. Van Nostrand) by Prof. William Cain, University of North Carolina, contains some well written sections, but the work is marred by frequent inaccuracies and infelicities both of thought and of expression. Descartes appears as Des Cartes (p. 1); continuous motion is motion without "hops"; and exception may be taken to the phraseology of some of the more technical definitions.

The "Projective Differential Geometry of Curves and Ruled Surfaces" (Teubner) is a notable work by Dr. E. J. Wilczynski, assistant professor of mathematics, at the University of California. The author says, "The instructor in an American university finds his time fully occupied by other things besides the advancement of science." This deliverance is doubtless too sweeping. American professors entirely free for research activity are very scarce, but the species is not unknown; in proof of which it is sufficient to refer to publications by the author himself prior to his appointment two years ago as associate of the Carnegie Institute of Washington. Nevertheless the present work is chiefly the result of investigations made by Professor Wilczynski in the capacity of such associate and would certainly have been much, it may be indefinitely, delayed, except for the freedom which the Carnegie Institution has enabled him to enjoy. Under the unbroken empire of Euclid, the birth of projective as distinguished from metric geometry was delayed for nearly two thousand years, and even then the times were inauspicious, for the genius of Desargues and Pascal dates with Fermat and Descartes and ante-dates but little the great years of Leibniz and Newton. The now famous Brouillon was even lost for two centuries. Meanwhile differential geometry had greatly flourished, and projective geometry was reborn in the genius of Poncelet and Plücker. But the former doctrine was *metric* and the latter, though algebraic, was not concerned with the *infinitesimal*. It is here, then, between these fields that Professor Wilczynski's domain, overlapping and penetrating them,

is found—*projective differential geometry*. Halphen in an "admirable theory of plane and space curves" had already made a start in this field. The author's contribution consists in presenting by his own method Halphen's work anew and in greatly extending the researches, particularly to ruled surfaces.

Unlike the foregoing work, "The Theory of Functions of Real Variables," vol. I. (Ginn & Co.), by Prof. James Pierpont, of Yale, is not of the nature of an addition to mathematical science as such, but it is not on that account a less difficult or less important performance, being a most admirable exposition of what in modern times has come to be regarded as the unshakable foundations of Analysis. "The work is based on lectures which the author is accustomed to give at Yale University on the advanced calculus and the theory of functions of real variables." Could the inventors of the calculus and those giants who during the succeeding two centuries boldly employed it to the great advancement of knowledge behold that instrument of investigation as transformed, chastened, perfected, by the master critics of the last generations, they would gaze at first in amazement. In such an exposition as that before us the student may catch something of the spirit that has wrought the transformation and gain acquaintance with the means and fundamental ideas of the masters of modern analysis, such as Cauchy, Gauss, Grassmann, Riemann, Wierstrass, Bolzano, Georg Cantor, Dedekind, Jordan, and others. Hitherto, in order to gain a knowledge of the best that has been done in the subject, it has been necessary to repair to foreign institutions; now it is no longer necessary to have recourse to foreign tongues, thanks to Professor Pierpont's simple and scholarly presentation of the matter in 555 pages. Some may not like the colloquial style of the author's discourse; some may not approve of the didactic Euclidian form of the exposition, notwithstanding its adaptation to the uses of reference and consultation; but every one will applaud the happy citation and criticism of current defects of argument.

The general public has taken very little interest in discoveries in physics of the last few years, although they are fairly revolutionary in character, and bear directly on many philosophical and practical questions. One reason for this apparent indifference has been the difficulty of getting readable and comprehensible accounts of the recent advances in science. But this difficulty no longer can serve as an excuse. Professor Rutherford has given us a comprehensive and thoroughly scientific treatment of the subject in his "Radio-Activity" (Macmillan); and Professor Duncan in "The New Knowledge" (Barnes), has presented it in a lighter and somewhat sensational style; and now Professor Jones of Johns Hopkins has published a book intermediate between these, well adapted to bringing one's physics up to date ("The Electrical Nature of Matter and Radio-Activity," D. Van Nostrand Co.). It is comprehensible to any one who has studied college physics, but Professor Jones takes no pains to present his facts in a striking way by either verbal or pictorial illustrations.

We may note together two text-books

which have a great similarity, being intended for the same class of students, the last of the high school or the first of the college, and they come from the same laboratory, that of the University of Chicago. ("Physics," by Charles Riborg Mann and George Ransom Twiss: Scott, Foresman & Co.—"A First Course in Physics," by Robert Andrews Millikan and Henry Gordon Gale. Ginn & Co.). Both are practical text-books, modern in matter and method, and printed and illustrated in the handsome style to which our school-book publishers have accustomed us. Both have final chapters on the recent discoveries in radio-activity and the electron theory. Professor Mann has cut out no small part of the dead wood which usually encumbers text-books on physics, such as descriptions of antiquated apparatus and old formulae, to make room for machines in commercial use and newer mathematical treatment. He is determined to make physics real and practical to the student, and among other devices to accomplish this end he has put on almost every page a small photographic illustration. Professor Millikan has given considerable space to the illustrative experiments which he is so skilful at inventing, and tries to interest the student in the biography of the science by full-page portraits of distinguished physicists from Archimedes to J. J. Thomson.

The variations in the principles and construction of dynamos and motors are so numerous that it is difficult to prepare a text-book which shall be at once comprehensive and manageable. In his "Alternating Currents: Their Theory, Generation, and Transformation" (Van Nostrand & Co.), Alfred Hay has given much material in small space; he not only describes standard tests and machines, but includes a large amount of new matter hitherto scattered in the journals. The only drawback is that he has thus crowded the space devoted directly to the theory of alternating currents. These chapters should have been expanded or omitted altogether. A student not already grounded in the subject will not be able to follow this part of the book, and, on the other hand, it is too fully developed for a mere reference manual. Modern texts on engineering are not made any too attractive. What with the elimination of all but skeleton outlines of results, the abbreviation of words and phrases, and the barbarous nomenclature introduced by electrical engineers, these books are, to say the least, not milk for babes. The engineering student would not be hurt by a little more polish and ease of expression, and the best way for him to obtain these would be from his college text-books.

Professor Linville has charge of the biological work in the DeWitt Clinton High School of New York city, and his "Text-Book in General Zoölogy" (Ginn & Co.) is designed to cover the whole field of zoölogy in as complete and practical a manner as the time allotted to such a course will permit. It includes both laboratory and field work on representatives of each group, and, besides being comprehensive and accurate, is readable. In place of the old stock cuts, it has been freshly illustrated with a large number of original drawings direct from nature. In the pictures and in the text especial attention is paid to the

relations of animals to their environment and to each other, to the presentation of a complete picture of the life of a particular locality.

Good plays, it is said, are never written; they are rewritten. The same is true of good text-books. Professor Smith is, therefore, justified in thinking that his work is the better for having grown gradually from the needs of his fifteen years' teaching in the University of Chicago. ("Introduction to General Inorganic Chemistry," by Alexander Smith: The Century Co.). This is a very complete college text-book, containing a large amount of descriptive and explanatory matter, similar in scope and character to the inorganic chemistry of Gooch and Walker, published last year by the Macmillan Co. The author has attempted nothing revolutionary in the order of presentation and in the treatment of topics. The hypotheses and conceptions of the science are introduced gradually where they are most needed. The atomic theory is postponed until the student has acquired a sufficient number of facts to make him appreciate its help. The ionic theory is used freely, but not extravagantly. It is useless to recommend a text-book because it has to fit the teacher, but we can say that any college instructor ought to take this book into consideration in selecting his class text.

"A Text-Book of Sanitary and Applied Chemistry, or the Chemistry of Water, Air, and Food," by E. H. S. Bailey is issued by the Macmillan Co. This somewhat cumbersome title is necessary because we have no convenient name for the new science of the household, which is coming to be a popular course in many high schools and colleges. It has had to be taught by lectures because the information is scattered in the innumerable bulletins and reports of experiment stations, and in the technical journals. In this book, however, Professor Bailey has brought together much of the material which he has used for his lectures on domestic economy in the University of Kansas, and made of it a practical class text-book. It includes chapters on the atmosphere, fuels, cleaning, sewage disposal, the composition of foods, the detection of adulterations, and the balancing of dietaries, illustrated with 150 students' experiments.

AN ENGLISH VIEW OF HAMILTON.

Alexander Hamilton. An Essay on American Union. By Frederick Scott Oliver. With portraits and a map. New York: G. P. Putnam's Sons. \$3.75.

A life of Hamilton by an Englishman is a novelty, and we have read Mr. Oliver's biography with interest to see in what new light a career so distinguished, but so well known, could be reexamined. Of course, new facts are hardly to be expected. No life has been more minutely searched by friend and foe alike, than Hamilton's; not merely since his death, but from the moment when he appeared on the stage, haranguing a public body at the age of seventeen, to the hour of his unfortunate end. An extraordinarily frank and courageous man, he had no pose for the public which concealed his real character. He played no part, he wore no mask. His professed opinions and objects were always his real opinions and

objects. From first to last he laid himself bare to observation, and to detection, if there were anything to detect. Involved in a most serious scandal, raising a doubt as to his official integrity, he cleared himself by a confession of the real wrong done so palpably truthful as to convince his most rancorous slanderers. Mr. Oliver has painted a good picture of the man, but it differs mainly in vividness from those which we have already. Like every one who comes into contact with Hamilton, Mr. Oliver is filled with admiration of him, made enthusiastic by his enthusiasm, sees with his eyes, hears with his ears, is persuaded by his eager and cogent reasoning, animated by his fiery zeal. In narrating the story, the author becomes a Federalist himself, and his account of the Democrats headed by Jefferson, and "the politicians" of whom Burr was the type, is not very different from the impression they made upon Hamilton himself.

Hamilton's enemies called him an adventurer—a convenient term, for it is capable of a double meaning. In the sense that he loved adventure, and that his whole career was a great venture—he was a new man, without family or "backing"—it was true. In the sense that his allegiance was to be had by those who would offer most for it, the term was ridiculously false. What the author says on this point can hardly be improved upon:

It is not without importance that upon the appearance of the first pamphlet Hamilton was approached by the Loyalist party with flattering offers of employment if he would transfer his services to the other side. Such proposals must have been attractive, not only on account of his youth and poverty, but for the further reason that so many of his sympathies were bound up with the ideas of monarchy and a settled Constitution. His prompt rejection of the offer is all the more remarkable, when we remember that it has been the ignorant habit of Democrat historians to write of him as if he had been a pure adventurer, and that even in recent times apologies for his career and appreciations of his character, with equal ignorance and less excuse, have tacitly assumed the justice of the charges. Only in the most romantic sense can Hamilton be termed an adventurer: only because he was a young man from a strange land seeking adventure; never because he sold his sword. A character less mercenary, and less concerned in any personal advancement, save as a means of rendering better service to the State, has never played a part upon the public stage. To the Dugald Dalgettys of history he bore no resemblance save in his courage; and if we are in search of an analogy we shall find it rather among the Knights of the Round Table than among the soldiers of fortune (p. 32).

Better, perhaps, than any of his previous biographers, Mr. Oliver has seized upon the salient features of Hamilton's temper and ambition. Enthusiastic as he was from boyhood, his enthusiasm was different from that of most of those with whom he was associated. Freedom, equality, even independence, were not by him worshipped as abstractions, as ends in themselves. They were all means to an end—the welfare of the Commonwealth. That just and orderly administration of affairs in the common interest which is the key to the happiness of States, was his ideal. "For all his love of freedom, his hatred of lawlessness was the stronger passion. Both, indeed, had their origin in his detestation of injustice and oppression." A generous and fiery devotion to justice is unhappily rare

among political leaders. United as it was in Hamilton's case with extraordinary political sagacity and power of exposition, and oratorical gift, he stands as the most interesting figure of the Revolutionary period. The "Oracle" of the patriots, he did not hesitate to risk his hold upon his party by resisting mob violence directed against persons suspected of Tory leanings.

In one important respect the book differs from all previous lives of Hamilton. It is written for an English audience and with a definite English purpose. Mr. Oliver is a Protectionist and a believer in "federation," and his object is evidently to show that as Hamilton planned and secured the adoption of a union among the emancipated colonies of Great Britain, expounding to them meanwhile the doctrine of Protection, so that they became in a hundred years one of the greatest of modern states—so might an English Hamilton of our day by some such means bring about a federation of the colonies and dependencies of Great Britain with the parent state. Here the book is, to our minds, distinctly weak; the author has nothing definite to propose, while the greatness of Hamilton lay, as he very clearly shows, in his ability not merely to dream of a Union, but to plan the whole charter of a confederated state, and to demonstrate in advance to the satisfaction of the communities affected that it was feasible. Had the author seriously asked himself how his dream of imperialist federation was to be carried out, he would have perceived at once that the cases were not only not parallel, but unlike at every point. The communities which Hamilton guided into federation were sovereign states, already linked together in a loose union, which had not to be invented, but to be improved and made more effective. Their governments and institutions were already democratic and homogeneous; to form a real union they had but to turn over to a central authority powers of which they had already a complete knowledge, and with the limits and scope of which they were perfectly familiar. Great Britain, on the contrary, is an established empire, of which the colonies and dependencies are bound to the parent state by an ancient system, which mingles great central authority with great local freedom. The British Empire is now a union of its own sort, and what is proposed is to change it into a union of some different sort. But the question is, of what sort, and by what means. Mr. Oliver draws no picture of what his union would be, nor suggests the means by which he would introduce it. To say that it could be introduced by Protection certainly derives no support from anything in the work of Hamilton. The Constitution introduced Free Trade between the States. If Great Britain copied us, the first step would be to bring to an end the existing system by which the colonies protect themselves, not only against foreign states, but against the mother country. How is this to be done? Mr. Oliver makes no attempt to answer the question. He gives us instead a fair account of Hamilton's report on manufactures, in which Hamilton showed, what no one, we believe, at the present day doubts, that Protection may be made an effective weapon in a young and wholly agricultural state to stimulate and diversify industry.

It is a wild jump from this to the conclusion which Mr. Oliver's "Essay on American Union" is intended to enforce.

The author devotes a chapter to "The Federalist," but makes no examination of its contents. Although he contrasts it with "The Prince" and with "The Spirit of Laws," he does not explain why it is a great political book; except that its chief author succeeded in carrying the plan of the Union through, against violent opposition, and that the Government of which he was one of the founders turned out a success. But there is no analysis, and the author seems to be one of those who discredit all political philosophy, a branch of science which he speaks of as having since Hamilton's day "drawn in its horns." This method of treatment is far from satisfactory. The author is puzzled to know how it was that Hamilton changed a hostile majority of two to one in New York into a majority for the Constitution. Mr. Oliver says, oddly enough, that the explanation is that while "The Federalist" is "pure advocacy," it appears to the reader to be "a reasoned judgment." The fact is, of course, that "The Federalist" is an argument addressed to a popular audience—the public itself—in favor of a plan of government—a political scheme, or charter—approved by the reasoned judgment of its advocate. It was the soundness of the reasoning that changed the obstinate majority of Clinton into a minority; and this is what makes the adoption of the Constitution the crowning act of Hamilton's life. In the pages of "The Federalist" we find the foundations of his reasoned judgment, and they are no other than those very principles of political science which Mr. Oliver thinks we have got beyond, but which Hamilton believed in with all the fervid conviction of his nature. Hamilton was a political philosopher, just as Burke was, and as Montesquieu had been before him. But he was a statesman, too, and was one of the few men in the history of the world who found the opportunity as a statesman to enact a scheme of government based in great part upon the philosophical principles which for him were the foundations of all government. This is what makes "The Federalist" a great book, in the opinion of all who believe that there are principles underlying the art of governing man. Hamilton's philosophy was the guide of his inspiration. We miss here any satisfactory account of it.

Mr. Oliver says in his preface that "no adequate life of Hamilton has yet been written," and modestly adds that he does not suppose himself capable of supplying the deficiency. To our minds, his narrative is by far the most interesting and vivid account that has yet been published; but, being neither a publicist nor an economist—and, if the truth must be told, having an opportunist's scorn for all principles of government—he is positively disqualified from the task of estimating Hamilton's work. To perform this, the biographer must be another Hamilton himself, at least as far as acquirements and mastery of principle go. He must unite with this, the generous capacity for sympathy which has enabled Mr. Oliver to seize upon and paint vividly the scenes of an heroic and even inspired career.

SIR RICHARD BURTON.

The Life of Sir Richard Burton. By Thomas Wright. 2 vols. New York: G. P. Putnam's Sons. \$6.50 net.

When a man's life has been written five times in eleven years, it is for the sixth adventurer to show that the lists are still open. Especially if the subject has unhealthy aspects, he must make it very clear that the previous attempts were fatally inadequate and misleading, and that his own work will bring us at least near the end of a disagreeable matter. He must not only have full and fresh information as to his subject, but he must have a broad and exact knowledge of the matters involved and ample tact in handling them. Our business is to get, as soon as we can, to a broadly correct estimate of a man who had in him undoubted elements of greatness, and to be clear as soon as we can of the repellent mass of uncleanness and prurient curiosity which has so long been associated with him. Gossip and chatter have here no place.

Unfortunately, Mr. Wright is a born gossip, and his chatter would be oppressive were it not so light. Lack of restraint is shown on almost every page, and he drops out-of-place remarks like the suggestion (ii, 95) of a notice in public libraries against King Yunan's method of turning over a leaf. Trivial anecdotes are his speciality. He boasts in his preface that about fifty are entirely new, and he indexes them carefully under "anecdote." These chronicle such important matters as Burton's rudeness—under great provocation—to Mr. Gladstone; how he swore at a waiter; how he quoted the rhyme of "Miss Baxter"; how he was recognized ecstatically here, and had limitations there. On another side it is only the license of the biographer when he enormously exaggerates the achievements of his subject. Burton was certainly, on no count, the first geographer of his day (ii, 25) nor the greatest English Oriental scholar (ii, 249), and even to speak of him as a great anthropologist or a great archæologist is to strain terms dangerously. In general knowledge, also, Mr. Wright unfortunately fails. He cannot follow and test Burton in his miscellaneous learning, and he is astounded by commonplaces of quotation. He is in ignorance of the relative standing of scholars; at E. H. Palmer, a far better linguist and Orientalist than Burton, he can poke fun (i, 209; ii, 43); and his remarks on Lane, certainly the greatest English Arabist, and on his translation of the "Nights," in some important respects better than any other, are simply absurd (i, xiii, 130; ii, 53, 54). The same ignorance appears again and again in dealing with Arabic and Oriental subjects. Mr. Wright is no specialist, but a *littérateur* at large, handling a very slippery matter, and even a specialist may easily come to grief over the "Arabian Nights."

What, then, is the justification of this book? What new point of view does it take, and what new facts does it offer? The justification, it may be said, is complete, in spite of Mr. Wright's weaknesses. Of all the five preceding books about Burton, its only real rival is that of Mr. Wilkins, which dealt with Burton only indirectly. The others were *Tendenz-schriften*, polemics by Lady Burton or by Burton's family, and unscrupulous at that. In the pres-

ent volumes we have a really fair attempt, without marked bias, to get at the facts in the case and to show Burton as he was. Of course, the objectivity is far from perfect. The hero-worshipping was to be expected and can be discounted. But the attitude towards Lady Burton is less explicable. In spite of general admissions of her good influence upon her husband, of her untiring and often successful labors on his behalf, of her essential nobility and sweetness, and even of her intellectual quickness and originality, Mr. Wright loses no opportunity of making damaging remarks about her and of exhibiting her generally in a ludicrous light. Her excellent, but un-schoolmastered English style especially arouses him, and that she, like Robert Louis Stevenson, never could learn to spell marks her, for him, as "uneducated." It is true that her character, with its frankness and enthusiasms, often lent itself to too easy ridicule, but the woman who held the love and respect of Richard Burton through almost thirty years of married life, who wrote "The Inner Life of Syria" and her autobiography, and who passed triumphantly through the test of the "Scented Garden," should not have been subjected to such belittling.

The new facts bear almost entirely on the translation of the "Arabian Nights," but are significant, also, for Burton's character. That he, in that translation, had curious indebtednesses to Mr. Payne was tolerably evident; he had, indeed, claimed the right to transfer to his own pages from those of Payne, Lane, or Torrens any rendering which seemed inevitable, but few guessed how inevitable the enormous mass of Mr. Payne's version had seemed to him to be. Mr. Wright compares them and finds pages with only a word changed here and there, not often for the better. He finds, further, that Burton's story of his translation is fundamentally false. When Payne's translation appeared, Burton had no written materials except a list of the contents of the first Bulaq edition, which was the only one he had, so far, used. Burton's version, then, is fundamentally Payne's with certain changes. (1) The verse is all different; some of it may, indeed, antedate Payne, as it was the verse which Burton had arranged with Steinhäuser to do. (2) The first few pages are enormously expanded and paraphrased, with what object is not clear. The same thing is occasionally done elsewhere; thus one complete anecdote is inserted on the principle that it should be in the "Nights" if it was not. (3) An attempt is made to bring the tone of the whole nearer that of the original. That Burton was not a book-Arabic scholar is now admitted, but, through his familiarity with the East, he had a very precise feeling for the language and tone of these stories and knew that Mr. Payne had missed it by miles. Their combination of Biblical simplicity, rank rolling rhetoric and drastic slang and vulgarity he thought he could reproduce on literal principles; simplicity with simplicity, rhetoric with rhetoric, slang with slang. Mr. Payne had reduced and polished until the "Nights" were trimmed down if not to decent, at least to polite society; Villon was made to go as Boccaccio. So Burton took "Payne" as a basis, and made most unjustifiably broad use of it. Yet he did put upon his book a separate stamp. Those who can stand

its artistically jarring style will get indefinitely nearer the real "Arabian Nights" than through the smoothness of Mr. Payne. (4) He added an elaborate and very peculiar commentary. Of this Mr. Wright thinks far too highly, just as he fails to appreciate Burton's restoration of the tone of the text. There are stray bits of real observation and information in it here and there, but Burton was always an amateur in the weak sense, and when his "learning" is most rampant, its second-hand, catch-word nature is plainest. A good example is that very note on circumcision, with which Mr. Wright is so impressed (ii., 122).

All this throws a peculiar light on Burton's sense of literary morality. The origin, too, of the method is plain from a remark of Mr. Wright, though he does not, himself, make the connection. Payne had issued five hundred copies only, and had pledged himself to print no more. The demand far exceeded that supply, and Burton actually suggested that he should reprint in his own name and account to Payne for the profits. Of course, Payne refused, and Burton seems then to have reprinted in his own fashion as well as in his own name (ii, 52). We find him also suggesting to Payne to change the order of the tales so that each volume may close with something peculiarly attractive (ii, 43).

Another and still more painful aspect of Burton is that developed by the episode of the "Scented Garden." There is no need to dwell upon it here. Mr. Wright only adds some color and heightens the pathos of the old man ending his life in his repulsive labor of love. Two things stand out very clearly: one, that the subject had become a true monomania with Burton and had destroyed the sense of comparative importance, never strong in him; and, another, that he had observed the money which could be made with "curious" books, and had wittingly set himself to pander to that taste. In what proportion these motives worked upon him it may be impossible to say; certain is the presence of both. Mr. Wright's hope that he can produce a life of Burton in drawing-room table form is naturally vain. His verbal restraint and suppressions will only excite curiosity.

What then, is left of Burton after all this biographizing? It can be put in brief. He was an adventurer rather than an explorer. From his journeys he brought little back, and he hardly ever accomplished what he set out to do. His "Pilgrimage" is his one clean-cut and finished bit of work, and even in that he did not carry out his programme. Again, he was a linguist, in the most colloquial sense, rather than a scholar. His book-knowledge and the lists of names he was fond of parading were always got up for the occasion. If he once knew Arabic grammatically, it seems certain that he had forgotten it. Steingass's notes to the "Supplemental Nights" and his version of "Aladdin" contrasted with Payne's made that clear long ago. But though his knowledge of book Arabic was probably not a tithe of even that of Payne, and though as a translator he was most untrustworthy, yet he had so steeped himself in the life and thoughts of the Muslim East that he was an interpreter of the highest value. If his "Arabian Nights" is often grotesque, repulsive, and inaccurate, the

student will always find it full of suggestion and atmosphere. His world is the world of the East, far from the trimmed topiaries and Italian garden effects of Payne. The same curse of the amateur, further, is over him in his archaeology and anthropology. Yet in both he was an amateur full of fertile suggestion and reckless courage. It is hard for the present generation to realize how narrow and mealy-mouthed anthropology was in its beginnings. That that stage is passed was largely Burton's work, and the present commonplaces of anthropology were the horrors discussed by him. Perhaps his real excesses in language and taste were needed to bring this about; certainly, his reputation was for long the victim of his work, and his character, almost his reason in the end, suffered under the dominance of a fixed circle of ideas.

It may be hoped that we have now, in this book, supplemented as it must be by the other five, the last of Sir Richard Burton. But much undoubtedly remains untold, including some matters of real interest. In spite of the wealth of information and photographs with which Mr. Wright has illustrated Burton's circle of friends and helpers, there are curious gaps. One important gap concerns Burton's attitude to the phenomena of spiritism. Another concerns the question of his relation to the Roman Catholic Church. That the constant dripping of his wife's words and example may have, in the end, worn through his cynicism no one who had observed his interest in the mystical side of the system of the Roman Church could absolutely deny. Such men as he are caught on the rebound; the mystery of life does its work; and with advancing years the wager of Pascal assumes a different aspect. His girding at the different forms of Christianity had become a bad habit only. Such points are still left, but our final hope must be that this is the end, and that the hates and loves, the weakness and strength, the achievements and failures of Sir Richard Burton may now rest in peace. And the final moral is, how little we really know of the man in spite of all these books.

Entomology, with special reference to its biological and economic aspects. By Justus Watson Folsom. Philadelphia: Blakiston, Son & Co. \$3 net.

Entomology includes within its view the greatest number of living creatures known in any one division of zoology. One might speak of insects as an "innumerable host"; for the number of existing species, of which over three hundred thousand are listed, must greatly exceed a million. It is not strange, therefore, that those who are interested in the study of animal life should have turned freely to them. Besides, they are so approachable by the unskilled, and many of them so attractive in their manners, that they have won the notice and engaged the thought of nature-lovers, especially of the young. Not a few men and women who have reached the highest distinction as naturalists, have begun their careers as tyros in entomology. Among those who have persisted in their first love and found their life work in the vast domain of insect life, is Professor Folsom of

the University of Illinois, whose "Entomology" is before us. The facts above stated—not to speak of the economic importance of insects—explain the appearance of the many books on entomology recently published. Most of them are well worth printing; some already have become classics. But "there is always room at the top"; an adage which one feels like applying to Professor Folsom's work. It easily takes rank not only with the best treatises on entomology, but among those which modern zoölogical science has produced.

The book has been written avowedly to meet the demand for a biological treatment of entomology. That end has been kept in view, leaving details of classification and habits and general relations to specialists in those departments. Yet the author gives briefly the fundamental facts upon which insect classification rests, together with an outline of the latest accepted system. Most naturalists and all laymen will approve his conservative attitude (p. 247) in the matter of species-making, which depends so much upon the good judgment of the systematist. He, if wise, is neither a "lumper" nor a "splitter"—shunning equally the tendency to break down the walls of well-established species, and the temptation to minute subdivision upon fanciful or insufficient characters, and thus to multiply generic and specific names to the sacrifice of the student's convenience and of the stability of nomenclature.

The chapters on "Anatomy and Physiology," and the closely related one on "Development"—embryological, not evolutionary—have a chief place, covering more than one-third of the 408 pages of text. Although adequately treated, in view of the limitations of the volume, one could wish that even more space had been given to such subjects as the so-called "music" of insects treated under the sense of "hearing"; and "luminosity," which is taken up under the physiology of the fat-system.

The chapters on "Color and Coloration" and "Adaptive Coloration" call up many interesting subjects, including that of "mimicry," which are presented with the author's characteristic sanity. In some cases the zeal, or perhaps one should say the imagination, of writers, has quite run away with their discretion; so that many assumed examples of "protective resemblance" are far-fetched. Yet it is certain that such a fact exists in nature and is particularly striking among insects. The pages given to this subject are crowded with interesting information and suggestions, which aim not so much at brilliant theories and original discoveries as at an intelligent abstract of existing knowledge. And this is the controlling motive of the book.

In the several chapters on the relations of insects to plants, to other animals, to one another, and to man, and on "Insect Behavior," the field of ethology—to use Professor Wheeler's apt term for studies of animal habits—is opened up. This gives the author the opportunity to present some typical examples of those wonderful ways of our "little brothers" of the insect world which have won the attention of so many observers in all ages. This discussion runs into the important subject of economic en-

tomology, which the Agricultural Department of our Government officially represents, and with which our whole citizenship is deeply concerned. The story of how the relationship of certain diseases to certain insects, especially the mosquito and the fly, was discovered and demonstrated, with its rare examples of high devotion to science, to duty, and to humanity, and its list of noble martyrs, is far too briefly told herein. It is to be hoped that it will never lose its power to win the attention and awake the admiration of those who read or hear it.

The Entomological Bureau of the Agricultural Department is fittingly noticed, and the reasons for its existence shown in the character of those insect destroyers that yearly mulct farmers, planters, stockmen, fruit-growers, gardeners, and florists in the sum of over three hundred millions of dollars.

The author's style is simple, concise, and lucid. His treatment of other writers is uniformly generous and just. He has made a book that will fill a real need. It is a book for public libraries; for scientific men; for physicians; for those who, lacking time and opportunity to take up the details of systematic and ethological entomology, wish to have at hand a volume of reference on general entomology which gives in brief and authentic and sufficiently popular form the latest results of the science. One of the most valuable features of the book is the large and well-chosen bibliography, which covers a vast field of entomological literature. Its topical arrangement greatly adds to its convenience and value. As a matter of course there is a full and satisfactory index.

La Révolution Française et les poètes anglais (1789-1809). By Charles Cestre. Paris: Hachette & Cie.

At the beginning of his volume M. Cestre complains not without reason that the English critics have maintained toward French revolutionary influence on their national literature "a conspiracy of silence." In spite of Professor Dowden's "French Revolution and English Literature," and some other recent studies, English criticism, as a whole, continues to be provincial in this respect. Hazlitt says of Horne Tooke that "he had none of the grand whirling movements of the French Revolution, nor of the tumultuous glow of rebellion in his head or in his heart." Hazlitt not only experienced these "grand whirling movements" himself, but in the closing pages of his lectures on the English Poets has pointed out the close relationship between the revolutionary spirit and the innovations of his great poetical contemporaries. It was left for a Frenchman, M. Legouis, to make the first scholarly study of this interdependence in his excellent volume on "The Early Life of Wordsworth." M. Cestre, besides adding to M. Legouis's material on Wordsworth, has extended the inquiry to Coleridge and Southey, and some of the minor figures of the movement. The chapter on the origins of English romanticism (pp. 231-341) is a very necessary supplement to the books of Professor Beers and Professor Phelps on the same topic. The eighteenth century English influences that these writers enu-

merate—Spenserian and Miltonian revivals, Percy's Reliques, Ossian, etc.—only succeeded in producing what M. Cestre terms classico-romanticism, a mixed genre still marked by pseudo-classic artificiality. Wordsworth's early work ("Descriptive Sketches," etc.) is of this transition type. The decisive step from "Descriptive Sketches" to "Guilt and Sorrow," the first poem truly Wordsworthian in both theme and diction, was taken under the stress of emotion called forth by the progress of the Revolution. But then, according to Professor Beers, Wordsworth is not a romanticist at all! M. Cestre is worth hearing on this point. "Wordsworth," he says, "is romantic by his antagonism to traditional poetry, his return to nature, his rehabilitation of the humble, his passionate expression of the elementary emotions, his idealizing of the commonplace, his mystical raptures, his conception of the poetical priesthood, his subjectivity." He is above all romantic by his endeavor to throw over the objects of every-day life something of the fresh wonder of the dawn.

One evidently gets deeper into romanticism by calling it the Renaissance of Wonder than by restricting the term with Professor Beers to the revival of the middle ages. Certain of M. Cestre's chapters (*Enthousiasme concret*, etc.) would suggest that a still more vital definition would be the Renaissance of Enthusiasm. In its essence, his book is a study of the awakening of enthusiasm in Wordsworth, Coleridge, and Southey by the Revolution; of the shock of disillusion that came to all three poets, not so much as the result of the revolutionary excesses, as of the invasion of the sister republic of Switzerland by the French armies; finally of the survival in some measure of the original enthusiasm for humanity even into the period of conservatism and Tory reaction.

The volume would perhaps have gained in living interest if M. Cestre had followed a method more intimately biographical, if he had gathered together into a connected narrative all the material bearing on each one of the poets, instead of scattering this material under a number of rather abstract chapter-headings. The subject is treated with a philosophic seriousness, one is tempted to add solemnity, that detracts in places from purely literary amenity. If there is too much philosophy for the literary reader, there is not always enough for the reader who believes that there are other possible outlooks on life besides that of the humanitarian enthusiast. The book is in the main a model of scholarly objectivity. Yet one is reminded occasionally that the author is himself, as would appear from another volume he has recently published in English,* a humanitarian with socialistic leanings. In dealing with the Utopian reveries of his heroes, he displays almost an excess of sympathy. His exposition of Coleridge's philosophy, for instance, admirable as it is in some respects, makes one regret the crisp and at times caustic good sense with which the

* *John Thelwall, a Pioneer of Democracy*, By Charles Cestre. London: Swan, Sonnenschein & Co. In addition to the published material, M. Cestre has drawn on unpublished MSS. of Thelwall's and has produced an interesting study of the beginnings of English radicalism.

classical Nisard dissects the whole tribe of Utopists in his chapter on Rousseau. And then, too, a touch of dry irony of the kind of which Leslie Stephen was a master would have just suited the exquisite absurdities of Pantisocracy and the dream of an idical colony on the banks of the Susquebanna. In a book that traces sentimental humanitarianism in England back to its source, M. Cestre might profitably have devoted all his psychological acumen to marking the ultimate differences between the humanitarian and the non-humanitarian views of life. Instead, he takes the humanitarian view too much for granted. He apparently reserves the term "idealistic" for the man who, in Wordsworth's phrase, has made "society his glittering bride." He praises Southey for having preserved, in spite of his disillusion, "la passion de vertu." Yet what a very modern notion of virtue this is! Rousseau is really the first who raised virtue to the dignity of a passion, much as the elder Dumas said that he had raised history to the dignity of the novel. Rousseau, indeed, is the father of the sentimental humanitarians by his substitution of enthusiasm and sympathy for restraint as the foundation of ethics.

M. Cestre has shown a correct artistic instinct in translating the passages from his English authors that he has incorporated in his text. At the same time, his book would have had more value for students and teachers of literature in America and England, if he had uniformly given his originals either at the foot of the page or in an appendix. As a whole, the volume deserves to take its place alongside Le-gouis's "Wordsworth" and Angellier's "Burns." Like these books, it was prepared to satisfy the requirements for the French doctorate, and like them combines accurate scholarship with broad and mature generalization. This is a union of qualities that one does not look for in an American doctor's thesis, and perhaps has no right to look for under present conditions for the granting of the degree.

Origines de la Novela. Tomo I. Introducción. Tratado histórico sobre la primitiva novela española por M. Menéndez y Pelayo. Madrid: Bailly-Baillière é Hijos.

With this volume the "Nueva Biblioteca de Autores Españoles" is splendidly inaugurated by its chief editor, Don Marcelino Menéndez y Pelayo. Writing, as is his wont, in an excellent style, entirely free from the fatuously pompous and involved rhetoric in which so many Spaniards take delight, Menéndez gives us the opening chapters of an account of the tale and the novel in his native land. His history, when completed, will serve as an introduction to an edition of tales and novels not included in the old "Biblioteca de Autores Españoles." It has a distinct entity of its own as a storehouse of information regarding the subject treated. Replete as it is with facts, which are accompanied by the critical views of a competent judge and embellished with valuable bibliographical notes, the work will supersede a large part of the Dunlop-Liebrecht "History of Prose Fiction."

By way of preface to his main subject, the author outlines the history of narrative fiction in ancient Greece and Rome,

This is no perfunctory performance on his part, for he has thoroughly explored the field of classic letters, as all know who have used his "Ideas Estéticas" and his manifold critical essays. For Menéndez, as for most critics, the novel is a secondary literary form. It represents the ultimate degeneration of the epopée, and therefore did not and could not exist in the really classic age of Greek literature. Classic Greek has no genuine novel, unless, perhaps, the "Cyropædia" be classified as historical romance, and certainly the Alexandrian, the Greco-Roman, and the Byzantine periods are those most important for the development of the novel. At the same time, an undeniable prelude to the coming novel is found in Lucian, with his imaginary accounts of journeys, his remnants of Milesian tales, his philosophical allegories and the like.

Greek shows hardly any trace of the realistic novel of manners. In Rome, however, this form is clearly present in the work of Petronius and in that of Apuleius. The former has influenced modern literature only slightly, but the latter's "Golden Ass" has inspired a large number of dramatic and novelistic productions, and it is Menéndez y Pelayo's opinion that most of our autobiographical novels, and especially the Spanish picaresque genre of the sixteenth and seventeenth centuries, owe something to Apuleius. This hint of a literary source for at least a part of the make-up of the Spanish novel of roguery, is interesting and plausible; it has been too readily assumed that the "Lazarillo" and its kindred are of wholly native inspiration.

Passing now to the body of his treatise, Menéndez y Pelayo surveys the course of the Oriental apologue and tale in the West and particularly in Spain. Upon the history of the "Kalila and Dimna" and the "Sindibad" legends he dwells with due regard to their significance, and he traces the Oriental heritage down through the productions of leading authors of the fourteenth and fifteenth centuries, among them Juan Manuel and the Archbishop of Talavera.

One of the most attractive divisions of the volume is that devoted to the chivalrous romance. In this chiefly exotic form he notes many borrowed factors. Thus, contributions were made by the Carolingian and Breton cycles, by the Italian romances of chivalry that hark back thereto, by the mediæval history of Troy, by the Greco-Oriental novels exemplified by the "Floire et Blanchefleur," by the stories of the Crusades, and so on. But, strange to say, Menéndez believes that the vast mass of chivalrous literature made no very strong impression upon the Spanish national life. "The ease," he says, "with which the romances disappeared and the profound oblivion that descended upon them indicate that they were not really popular, that they had not penetrated into the consciousness of the people, although for some time they dazzled their imaginations with brilliant phantasmagorias." To all of this many critics will hardly subscribe; the vogue of the "Amadis" and its congeners was certainly too enormous and too continuous to permit us to consider it in the light of a passing fad.

Waiving the question of the date of the "Amadis," we must concede that the oldest

romance of chivalry indigenous to Spain is the fourteenth century "Caballero Cifar," the sources of which an American student, Mr. Wagner, has industriously investigated. To this story historians have at last begun to give an all too tardy justice, and now Menéndez y Pelayo points out—as he has done also in his tercentenary "Discurso" on the "Don Quixote"—that the figure of the Ribaldo, the picaresque squire of the Knight Cifar, is a prototype of the immortal Sancho Panza. It is hard to escape the conclusion, after reading the earlier story, that Cervantes, for whom Sancho Panza was really an afterthought, since Don Quixote issued forth on his first sally unattended by any squire, read and imitated the "Caballero Cifar."

After the novel of chivalrous adventure, the author considers at great length the categories of the sentimental, the historical, and the pastoral novel. To his treatment of these subjects unstinted praise should be given; it is characterized by great fulness, accuracy, and lucidity, even when he deals with the artificial, perplexing, and deadly dull romances of shepherds and shepherdesses. We shall await with eagerness the appearance of the continuation of the "Orígenes de la Novela."

The German Universities and University Study. By Friedrich Paulsen, Professor of Philosophy in the University of Berlin. Authorized Translation by Frank Thilly, Professor of Psychology in Princeton University, and William W. Elwang. New York: Charles Scribner's Sons. \$3 net.

This is Professor Paulsen's well-known work, translated in 1895 by Prof. E. D. Perry, enlarged to more than four times its size, and fresh in the clear, forcible English of Professor Thilly. Curiously enough, there is no mention of the earlier German or English volumes, though Paulsen gives Professor Perry ample recognition for his study of the American university field. The work is an absorbing presentation of the theme, and by its rather frequent allusion to American institutions, throws not a little sidelight on the progress of the higher education here. There is an introductory chapter on the general character of the German university and another, on its historical development from the Middle Ages to the present time; there is a discussion of its present organization and place in public life, and a study of the university teacher, university instruction, and that *Lehrfreiheit* which, to quote Paulsen, made Stanley Hall, ten years ago, exclaim: "The German university is to-day the freest spot on earth"; there is an investigation of the student and of student life, with special reference to *Lernfreiheit*, or elective privileges; and there is a review of the different faculties of theology, law, medicine, and philosophy, the unity of which, as formerly, the author contends, centres about the school of philosophy. There is, too, a bibliography, a list of German universities, and an extensive, but incomplete, index. The work, however, is something more, and for the educator in general: Professor Paulsen chats with us, and even gives us lengthy dissertations on methods in lecturing and teaching—the

form of the lecture, the question of textbooks, the nature of the student—thus making the work, without doubt, all that Professor Thilly claims for it—"the most satisfactory exposition of university problems and the most helpful practical guide in solving them that has been published in recent years."

Admitting the dangers of the "big leap" from school to university (which, by the way, Prof. Nicholas Murray Butler pointed out in his Introduction to the first edition in English), Paulsen thinks that Germans "might approximate the English-American system with intermediate and transition steps between the school and independent scientific research," and suggests it as a good place to put in the year of military service, with its broadening, disciplinary value. With Andrew D. White he attributes to the German universities much of the fame that Germany enjoys in America, notes with satisfaction the number of American scholars who "studied and won their doctorates in Germany," and thinks that Americans have had greater success than either the English or the French in unifying scientific labor and instruction. In accord with Kant, Paulsen believes that science exists in order to be of service to mankind, and that science is therefore the concern of the people as well as of scholars. Thus he comes naturally to the small but promising beginning in university extension work, after the example of the English and American colleges, which has been made in Berlin, Leipzig, and Munich. In co-education and its modified acceptance in German academic circles, Professor Paulsen sees only the recognition of a just demand by women for greater opportunities, but—and this will be of special interest to those who know Paulsen's recent private views on the attitude of the German universities to *das ewige Weib*—he does not find in the rising woman, with her physical and consequent mental limitations, either any serious danger to man or any promise of additional strength to advanced science.

Our author glories in the intellectual freedom of the German university, commending the ultimate decision in the famous case of Dr. Arons, the *privat-docent* of physics, who was arraigned by the Government for affiliation with the Social Democrats, and defended by the University of Berlin; rejoices that American universities, like the French, have caught the German watchword of "original research"; and, with Lamprecht, in his recent "Americana," believes that some of the higher institutions here are making great strides in freeing themselves from all trammels. He draws the line, however, at various schemes which are growing in favor in the Western world, and which seem to him fads. He objects in particular to the plan for a seminary of "university pedagogics"; the only seminary for the training of teachers, he declares, is the "master's studio," at the feet of a modern Gamaliel. Of the international exchange of professors now going on between Germany and America, and proposed for other countries, Paulsen says nothing, although it was long discussed before the German Emperor gave it his support. He does recommend, however, the sending of German students to America for a term or two, to round out their training. In theological matters Pro-

fessor Paulsen seems unusually fair, especially in treating the question of additional Roman Catholic faculties of theology to give adequate exposition to their side; he does not hesitate, however, to say that Catholicism needs a revival of a "freer, deeper, more personal religious life," and that "if Catholicism expects to live, if it does not wish to cast its lot exclusively with the decaying group of nations, it will be compelled once again to submit to the Germanic spirit," to heed the warning of changes in its own ranks in America and elsewhere.

Taking up the matter of both professors and students, the distinguished author has much to observe of special interest to Americans. He has a good word for the system in Germany by which a professor is excused from duty in old age rather than neglected or even retired on a pension; he reprobates sharply the increase in titles and decorations among professors, and condemns the professor who is occasionally tempted to shine in the limelight of the daily press. He advocates the erection of dormitories in large cities and the encouraging of students to leave their undesirable private quarters; and he favors the still further introduction of healthy out-door sports among the students, not merely for their own sake, but in the hope that through them the German public may be reached. Paulsen also advises the abolition of *Stundung*, or delayed payments of fees, which burden students and often require police and court aid to collect. He finds in fraternities some of the opportunities for students to rub up against all kinds of people, as in the general society of English and American colleges; and he severely condemns duelling and, for the most part, the *Mensur*, though pointing out one or two good influences resulting from it. Altogether the professor holds several briefs for the German university student. He does not believe there is much wanton shirking of lectures; cites the known fact that there is no rowdiness in a class-room (would that we Americans could say as much!); and notes that if any student offends, as by even regularly coming late to a lecture, "the students themselves do police duty." Social and economic changes, however, especially in great cities, are doing away with many of the good old customs of the past, and with the steady increase in attendance, professors and students are drawing further and further apart.

Aus Meinem Leben: Erinnerungen von Rudolf Haym. Aus dem Nachlass herausgegeben. Mit zwei Bildnissen. Berlin: Gaertners Buchhandlung.

Four years have passed since these autobiographical sketches of Haym were published as a private memoir, and to-day, with their re-issue in popular form, we are still better able to judge the striking personality of this German scholar. Unfortunately, the work is incomplete: it begins with Haym's birth at Grünberg, Silesia, October 5, 1821, extends through more than forty eventful years of social, political, and literary revolution, but fails to record the fruitful period in which the great critic wrote his "Romantische Schule" and "Life

of Herder." It fails necessarily, also, to show us how Haym, following his long series of contests with the German Government, maintained his individuality while settling down in a Government university and adapting himself to his later environment. For his last decades, Haym was the most honored figure at the great University of Halle; thousands of foreigners studied under him and his relations with Americans were particularly agreeable; yet because, on his vacation trip to St. Anton in the Tyrol, in 1901, his light died out suddenly before he had finished his task, there is scarcely any allusion to his foreign friends and disciples, where we should have expected a mass of reminiscence and personal anecdote. That which has flowed from the pen of the old man, however, bears on every page the stamp of the painstaking, conscientious diary-keeper; his *Selbstbiographie* has that rarest of all autobiographical virtues, absolute honesty and openness of mind and heart. Those who knew Haym personally will recall him as manly and straightforward in the extreme; and in the volume before us he lays bare his innermost feeling concerning not only others but himself. Indeed, some of the spiciest passages give the riper opinion of his own early literary, bread-winning, and love performances, and there are not a few well-directed, though kindly, thrusts at his forerunners and contemporaries. Evidently the manuscript has been little changed.

Haym was preëminently a literary critic and his literary and academic career first engages our attention. Disturbed as it was, it had, after all, considerable unity of purpose and result. Sweating over algebra, as a non-mathematical *Junge*, he became early acquainted with Herder's works, and from his first entry into Halle, in 1839, he had a distinct longing for the fields of literature and of higher education. He thought of theology, and on the advice of Gesenius, made several vain attempts to prepare for the Church; he worked on encyclopædias, writing philosophical articles, and learning English; he received his Ph.D. in 1841, and passed his State examination, doing well in ancient languages, but flunking on the map of Rome—though he had marked up the wall and furniture of his room with geographical names. He tried his hand at *gymnasium* teaching at Cologne, but failed on account of near-sightedness (having run a knife into one eye when he was a boy), his Silesian dialect, and his inability to control the pupils. In 1850 he entered Halle University as a *privat-docent*, and finally, in 1860, established himself there as professor to succeed Pratz. During these years his association with eminent men had a marked effect on his career. His first visit to Gesenius brought him the reproving advice to come next time at a more reasonable hour; he was taken under the wing of Niemeyer in the trying days of his *Fuchsthum* at the university; he visited Turnvater Jahn on his first journey to Weimar and the Wartburg, and met Eduard Erdmann, who later opposed his entrance to the Halle faculty; he attacked none other than Lachmann, and won his friendship thereby; and he came into close touch with Kuno Fischer, the elder Droysen, Gustav Freytag, Mommsen, and the brothers Humboldt. Erdmann's political objections to Haym were overruled by the Government,

and Haym was appointed to Halle while Erdmann was still rector. Custom required Erdmann to welcome Haym officially, but he showed his spleen by an address in which he declared his difference with Haym on political issues, avowed ignorance of anything that Haym had as yet done in literature, and expressed the wish that, since he was appointed despite the faculty's will, he might soon write something of value.

Haym's own account of the political movements with which he was identified is full of interest. We find him in his teens at Halle partaking, as a radical *Theolog*, of the student unrest there; at Rudelsburg, on Pfingsten, 1840, we hear him shouting with the rest of the *Burschen* at the news of Frederick William III.'s death; a little later, with several students, he overpowers a trio of constables and releases a woman charged with notorious theft; he is called before the police on account of his close identification with the theological movement at Halle, is told that he is ahead of time in his views, and astounds the chief of police with the answer: "We are the times!" He tries to live at Halle, in 1845, and is opposed on political grounds; he writes a political comedy, becomes editor of the proceedings of the first Prussian Legislature, of which body he was also a member, is swayed by the news from Paris of the February Revolution and duped by Hansemann into going to Berlin to join the agitators there, and so on through the early years of his life.

The personal side of Haym must always have presented much that was attractive, though as a boy and youth he was timid and reticent to a degree that interfered with his progress—a weakness that prevented him later in all three parliaments, powerful as he was with his pen, from making a single speech or taking part in any debate. We find him a boy among boys, now drawn into a scheme to cheat the theatre with cancelled tickets, now evading the gymnasium on account of an unwillingness to flirt with the all-too-fascinating daughter of the common drill-master, and then half-drowning in the swimming school through his repugnance to water and the swimming teacher's determination that he shall get all he can of it. He pictures himself as a youth welcomed to Halle Vereins by the romantic dreamers of that slower age, one of whom finds Haym's heart in a heavenly hour, by asking, *Hast du denn deine Ideale?* and we catch him failing to take a water-cure, because he carries too long each day with the miller's daughter, and never reaches the old water-wheel, used for a shower-bath!

Nelson's Encyclopædia. Volumes I., II., and III. New York: Thomas Nelson & Sons. (To be complete in twelve volumes. Price \$42.)

In the three volumes before us the editors and compilers have fairly well accomplished their purpose of furnishing a high class reference work for busy men. Since there is no pretence to literary merit the lack of it can scarcely be criticised. For those who seek a "family" encyclopædia in which to follow "courses of reading" during winter evenings, the present production will be inadequate. It cannot take the place of the German "Brockhaus" or "Meyers,"

the English "Britannica," or less extensive works such as "Chambers'" and the "New International." But, despite many grave faults, it is, in concise treatment of topics of general and current interest, perhaps the most useful compilation yet published. In method it follows to the extreme the idea of the "Konversations Lexikon"; that is, each distinct part of a large subject is treated as a separate article in its appropriate alphabetical order. In this respect the "Nelson" more nearly than any of the other large cyclopædias approaches the abridged French "Larousse."

In the maps and illustrations we note one of the most striking shortcomings in these volumes. The maps are, if anything, below the ordinary low level of American-made maps. Beside a few poor colored maps of the larger divisions there are numerous black and white line maps of cities, States, and nations, many of which are little more than undecipherable blotches. The illustrations by their character and profusion are clearly intended to popularize the volumes, but here, too, quality has been sacrificed to quantity. There are colored plates, execrable both in taste and workmanship, and poorly printed half-tone portraits of the grade one finds in daily newspapers. The "current interest" fetish is responsible for a series of page groups such as "Admirals of the United States Navy," who are not all admirals, and of "Famous Actors of America," including such modern celebrities as Sothorn and Mrs. Fiske. The effect of many otherwise good full-page portraits, of which Burns and Aristotle are examples, is marred by printing on the back, which shows plainly on the face of the picture. The only acceptable illustrations are the simple line drawings of architectural works, machinery, and the like.

The bulk of the text was prepared in England with an avowed subordination of literary and classical subjects to those of "living interest." This English text is now publishing in England under the title of "Harmsworth's Encyclopædia," to which British authors and scholars of the highest rank have largely contributed. The best of these contributions remain intact, and are among the most valuable parts of the work. For sale in this country, however, the encyclopædia has been extended and thoroughly "Americanized"; and this process has introduced many new articles of varying quality. The result has been some rather startling examples of disproportion; for instance, Benedict Arnold and John Brown are accorded more space, respectively, than Alfred the Great and John Bunyan. Length, however, is not a just criterion of value, and as a rule the long biographical articles, such as those mentioned and the articles on John, John Quincy, and Charles Francis Adams are exceptionally well done. The same praise cannot be accorded the shorter gazetteer articles and the minor biographies; many of the latter, particularly those of contemporary notables, are mere outlines, like those in "Who's Who." Some of these short outlines are singularly inadequate. There is no estimate of Gertrude Atherton's writings, but space is given to the statement that she "has passed much time in England and the Continent"; while Poultney Bigelow appears to be chiefly

"known for his voyages in a canoe on European rivers."

Many slips appear, such as the use of "Boonesboro" and "Boonesborough" in the same article, and calling Beloit College a "Congregational" institution in the article on the city, and a "non-sectarian" institution in the article devoted to the college itself. Simple proof errors, however, seem to be unusually few. Some of the brief definitions are curious, to say the least; for example, "Bulbul, an Arabic word much used in Persian poetry, though there is some dispute as to the bird to which it applies." Of minor errors of fact there are many. Concord became the capital of New Hampshire in 1808, not in 1816; Arkansas, like the rest of the Louisiana Purchase, was for a time under Spanish sovereignty; Stephen F. Austin founded San Felipe de Austin (now San Felipe), a town on the Brazos River, in 1822, and not Austin, the present capital of Texas. It is of course incorrect to say that David R. Atchison actually "was President of the United States" even for a single day. The fact that there is both a Charleston and a Charlestown in West Virginia, probably accounts for the omission of the first, which, in addition to being the State capital, is by far the more important. Such errors, irritating as they are, can be so easily remedied in future editions, and are confined so generally to minor articles, that too much stress should not be laid upon them. Still their frequency, and the sacrifice of purely classical, antiquarian, and literary subjects, in order to make room for topics of contemporary and passing interest, form a serious objection to a work possessing many admirable features.

The Making of an Orator: With Examples from Great Masterpieces of Ancient and Modern Eloquence. By John O'Connor Power of the Middle Temple, Barrister-at-Law, and sometime M. P. for the County of Mayo. New York: G. P. Putnam's Sons. \$1.35 net.

This book is undoubtedly interesting and valuable; yet it is not entirely obvious who will most appreciate its interest and value. It is announced in the preface to be "intended for students, young or old, who have had no practice in public speaking, and for speakers who are not unwilling to consider suggestions made by another."

And undoubtedly most of its suggestions would be of great value to unpractised speakers, if such were able to carry them out in full confidence. But the truth of them, and still more their practicability, can hardly be appreciated, except by those who have already had practice, and even some measure of success in speaking. The author reduces oratory as far as possible to its elements—an audible voice, a clear arrangement of facts, historical illustration, logical argumentation, profound and sincere conviction. He urges again and again that to make one's self an orator every one of these essentials must be cultivated; and then prescribes that they are to be practised and developed in this order: first, clearness of speech only; secondly, delivery of speeches containing nothing but facts, gradually adding and superadding each of the elements. The difficulty

here is that any speech to produce the effect which Mr. Power contemplates must contain all these elements from the very beginning, or it is no speech at all. He approves to a limited extent of committing to memory and delivering select extracts. But he is eager to hurry his novice to original composition, and dwells with great energy on the superior character of extempore speaking, urging the usual consideration that so only will freshness be secured. Yet it is a matter of common observation that most speeches which have no previous aid from a pen are anything but fresh; a rehash of the old thoughts and phrases which come crowding to a speaker's lips, pushing back the really fresh thoughts whose wonted residence is the tip of the pen. It is safe to say that an oration, devised by Mr. Power's method, so far from having a truly spontaneous character would be artificial in the extreme. There are countless useful anecdotes and warnings interspersed to forestall such a disastrous result. But their point will be scarcely perceptible to the young mechanic, constructing his orations by a series of precepts to be applied externally. They will sound very familiar and trite to the speaker, who has already learned his art by plunging in headlong, as one learns to swim, or, better, as one learns to ride, where the riding-master has given half a dozen directions to be observed all at once, and where a single failure will land one on the ground.

The masterpieces of oratory are in general well selected. Those from Demosthenes and Cicero are in translation, and as far as the Cicero goes in a poor translation, artificial and over-ornamented. There is nothing from any great French preacher or other speaker, where a really good translation would be much easier to find. The English extracts, from Burke, Gladstone, Bright, and others are good; and a liberal compliment to American oratory is followed by Mr. Lincoln's Gettysburg address; while an after-dinner speech of Mr. Choate's is given as a model of lighter speaking.

Such models, as indeed the author himself admits, are likely to do more for the young orator's training than the elaborate precepts; the truth of which will generally be thoroughly admitted—by those who have no need of them.

Drama and Music.

If A. W. Pinero is not absolutely the first of living English dramatists he certainly is one of the most expert makers of plays. His skill in the art of technical construction was shown even in his earliest farces, and has been growing ever since, until his mechanism now is often not unworthy of comparison with that of Ibsen himself. There is a fine example of it in the curiously named "His House in Order," which was performed here for the first time in the Empire Theatre, Monday evening. It is scarcely likely that the piece will be as successful in New York as it was in London, not only because the subject is unsympathetic and the types of character essentially British, but because the American performers are not success-

ful in bringing out the full effect of Mr. Pinero's dialogue, which is superior in general quality to that of most of his contemporaries. This shortcoming is all the more unfortunate, as for two acts the interest depends mainly upon the explanatory and satirical qualities of the conversation. As usual the peculiar ability of the author is shown in the manufacture of one or two leading situations to which all minor considerations of probability are subordinated. This comparative indifference to the nature of the premises necessary to the establishment of a climax was exhibited in "The Second Mrs. Tanqueray," "The Notorious Mrs. Ebbsmith" and "The Gay Lord Quex," to say nothing of that extraordinary blunder, "A Wife Without a Smile." In the present instance he wished to lead up to a climax in which a young woman, the second wife of a widower, driven to desperation by the perpetual tyranny of the family of her husband's first wife, is suddenly, by chance, placed in the possession of evidence clearly proving that her predecessor, instead of being a paragon of all the virtues, had betrayed her husband shamefully, even to the extent of imposing upon him, as his own heir, her lover's child. Clearly this is a situation providing a rare opportunity for an actress of genuine emotional power, but the combination of circumstances by which it is secured will not bear close investigation. All the conditions and most of the personages involved are abnormal. Some of the incidents are almost grotesque, as when the husband and the rest insist that the second wife shall put on mourning to attend a ceremony in honor of the first. But Mr. Pinero rarely hesitates, apparently, at any expedient which, in the end, may serve his dramatic purpose. In his latest play, having endowed the down-trodden wife, with means for the fullest revenge, he makes her resign them voluntarily, and subject herself to new humiliations, in a spirit of Christian resignation inspired by a diplomat, who is her ally. As one of Ibsen's women remarks, "People do not do such things." Nevertheless "His House in Order" is, technically, a wonderfully well-made play, and very interesting after the action has once got into full swing. The characters, especially the narrow, bigoted, conceited, pharisaical Ridgeley family, are admirably drawn, but here the veracious effect of them was marred by the exaggeration of the performers. The dialogue, without being particularly brilliant, has a conciseness and point which give it a positive literary value, and would probably be more effective in print than on the stage, where it is uttered with very little sense of its varied shades of meaning. But elocution is rapidly becoming a lost art among actors. "His House in Order" as a life study, is an advance upon Mr. Pinero's so-called problem plays, though of less interest, perhaps, to the general public. If it adds nothing to his reputation it will detract nothing from it.

The great Theatre Alla Scala, at Milan, is an example of a theatre that is administered not to make money, but as a centre of art, for the education as well as the pleasure of the people. It is in part owned by the city, and received from it, until 1901, a considerable subvention; in that year it was decided by a referendum that

this subvention be suppressed; and for a time the theatre was helped out by a syndicate of boxholders. A commission was appointed last March to propose measures for adoption after the termination of the present contract with the boxholders. In their report recently made, they propose that in a new contract for nine years the city should, by remission of taxes, facilitation of a renewed system of illumination, assumption of the expense of certain changes in the building, etc., enable the theatre to satisfy the demands of a modern public. They support these proposals on the ground that, as the theatre is in part the property of the city, and is an institution of public benefit, and not an instrument for making money, it is the duty of the community, as in the case of a hospital or a museum, to maintain and increase its effectiveness. Among the changes proposed is the lowering of the orchestra, after the manner of Bayreuth and other theatres, and the conversion of the fifth tier of boxes into a sort of superior gallery, for people of moderate means, who cannot afford a box, and do not like the promiscuity of "the gods." By this means, and by maintaining the eight performances (out of the fifty that constitute a season) at reduced prices, they hope to obviate the objection to the opera as the rich man's pleasure, and increase the opportunities for culture of the general public.

The chief event of the Mozart Festival at Salzburg was a performance of the ninth symphony of Bruckner. It was to have been conducted by Dr. Muck, but he could not come, and Richard Strauss took his place. Bruckner died before his works were appreciated. Now they are being played with success everywhere—except in America. The boycott placed in our concert halls on the symphonies of Bruckner is as astonishing as the neglect of Rubinstein's works, which, with their abundance of warm melody, are always sure of a warm welcome.

The Germans at last have an up-to-date book on their deepest musical thinker. It is by Professor Wolfrum of Heidelberg, and is published in Berlin by Bard, Marquardt & Co. Spitta's Bach biography, in two volumes, is a monumental work of erudition and analysis, but it is for reference only, while Wolfrum's is a book to read; it contains also the results of the latest researches. The author shows that Bach, like Wagner, Liszt, and the other great masters, had to spend his life "amid persistent annoyance, envy, and persecution."

The *New Music Review* for September has an interesting article by Lawrence Gilman entitled "A Neglected Page of Wagner." It is concerned with the Paris version of "Tannhäuser," concerning which Mr. Gilman says: "Throughout the seventy-odd pages which now comprise the bacchanale and the first scene proper, there is scarcely a measure that has not undergone some transformation, harmonic, rhythmic, or orchestral; and there is a liberal proportion of absolutely new matter." The musical journalists have not paid sufficient attention to these wonderful changes, with their suggestions of "Tristan," "Meistersinger," and "Parsifal," which so greatly heighten the beauty and the intensity of the music.

JENKS'S CITIZENSHIP AND THE SCHOOLS

By JEREMIAH W. JENKS, Professor in Cornell University. 264 pp. 12mo, \$1.25 net.

THE BOOKMAN: "Prof. Jenks's first essay on 'Training for Citizenship' impresses one as perhaps the best introduction to the study of our government and politics that can be put in the hands of the young men and women of our colleges and high schools. His two essays on the 'Relation of the Public Schools to Business' and 'Education for Commerce in the Far East' reveal the writer as a better guide for so-called 'practical' men than many of these practical men have been for their own kind."

Pathological Aspects of Religions

BY
JOSIAH MOSES, Ph.D.

A dissertation for the Doctor's degree, with an Introductory Note by President G. Stanley Hall.

Monograph Supplement No. 1 to the *American Journal of Religious Psychology and Education.* pp. viii-264. Price \$1.50, by mail \$1.60.

Sold by G. E. STECHERT & CO., 129 W. 20th St., N. Y. City.

FAVORABLY RECEIVED EVERYWHERE.
The first edition of Haworth's **THE HAYES-TILDEN DISPUTED PRESIDENTIAL ELECTION OF 1876.**

Cloth, \$1.50 net (postage 12c.).

The volume is to a great extent based on material which has been gathered from the richest of all sources, such as the proceedings before the electoral commission and the various investigating committees, as well as the Congressional Debates for the period, and much similar data.

The author's task was very difficult. It is safe to assert that up to ten years ago it would have been practically impossible to make so unbiased and thorough a study of the question as Mr. Haworth has done, and it would seem equally certain that at no time in the future will it be possible to secure such personal assistance as has been given by a large number of parties directly connected in some way with one side or the other of this controversy.

"His conclusion is that the result was just; but the disgrace rests upon the politicians of both parties of intimidations and frauds, such that it is more pleasant, if not more profitable, to forget all except that a great people took a peaceful method of settlement of a warlike question."—Hartford Courant.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 13, 1906.

The Week.

Monday's election in Maine looks like a very black eye for the Republicans. In any previous year, they themselves would have so regarded it. To see their plurality for Governor cut from 26,000 to 8,000; to have the majorities for their Congressmen whittled away by from 2,500 to 6,000 votes; to witness the Democrats more than doubling their representation in the Legislature, and carrying all but four of the twenty cities of the State—these things could not have happened to them at any time within thirty years past without exciting both wonder and apprehension. In this year of grace and optimism, however, able Republican explainers arise to make light of it all. A political black eye? Oh, you are wholly mistaken; that is only a dark circle indicating excessive thought. Anyhow, a little skilful painting will make it almost imperceptible. The first dab of whitening is, of course, a reference to the Maine prohibitory law. But the Democrats, having the same demand for resubmission in their platform of 1902, were then beaten by more than 27,000 votes. Again in 1904 they tried to sail with the anti-prohibition current, but were again defeated by over 26,000 votes. Admitting a certain heightened resentment at attempts really to enforce the prohibitory law in cities—for to make prohibition more than a dead letter in any large town in Maine is the sure way to rouse the electorate to fury—it is clear that some force must have been at work this year which was not operative in 1902 and 1904.

Another explanation, though a disquieting one to the very Republicans who offer it, is that the labor vote went solidly for the Democrats. The result in Mr. Littlefield's district is especially referred to. His plurality two years ago was nearly 6,000; Monday it was barely 1,000. Mr. Gompers will undoubtedly point to this marked loss as a direct result of his invasion of the Second District, and of his appeals to laboring men to vote against Littlefield. Yet Congressman Allen's plurality sank 3,400; and that of Congressman Powers fell off more than 6,000; and Gompers did not speak against either of them. Indeed, there were some shrewd observers who alleged that Gompers rather aided Littlefield than otherwise; the Democratic candidate, McGullicuddy, is reported to have said that, if Gompers had only kept away, he would have beaten Littlefield. By making the latter a national figure, votes were won for him

which otherwise he would not have received. We believe that there is much truth in this reasoning; but, of course, it will not seem even plausible to those who do not know the local conditions. Mr. Littlefield's narrow escape will be pointed to all over the country as a demonstration of the political power of the American Federation of Labor. It will alarm the Republicans, and will, we fear, lead them to ignoble concessions to Gompers, and attempts to placate him, instead of withstanding him in the manly fashion of Mr. Littlefield. Chairman Sherman and Speaker Cannon are both singled out for the Gompers lighting, and it will be interesting to see whether they maintain their Ajax attitude, or try to dodge from now on.

Vermont's fame as a political barometer has been sustained by the results of twelve out of the last thirteen elections. For twenty-six years past a Republican plurality of more than 25,000 in the September election has prefaced a Republican victory in the country at large, while, with a single exception—the off-year election of 1898—one of less than that figure has justified the hope of Democratic success. Fletcher D. Proctor's plurality of 15,676, as given in the unofficial returns, is thus rightly regarded as a hopeful sign for the Democrats. For comparison here are the popular pluralities for Governor, with the corresponding pluralities in the House of Representatives and the Electoral College:

	Vermont Governor.	House of Representatives.	Electoral College.
1880	26,603 R	8 R	69 R
1882	21,373 R	74 D	
1884	22,704 R	84 D	37 D
1886	20,522 R	15 D	
1888	28,995 R	7 R	65 R
1890	14,163 R	148 D	
1892	19,702 R	94 D	132 D
1894	28,521 R	142 R	
1896	38,571 R	72 R	122 R
1898	23,869 R	142 R	
1900	31,312 R	45 R	137 R
1902	24,500 R	32 R	
1904	31,559 R	114 R	196 R
1906	15,676 R		

Vermont, it is true, has not often had a campaign conducted so largely on local issues as that of Proctor and Clement has been, but the habit of shifting its vote on national issues is hard to break.

At the Democratic conference in Albany last week there was plenty of inspiration for all who believe that the Democratic party may yet be made of value in the government of this State. For similar earnestness and determination one must turn back to the anti-snap convention of 1892. That gathering was a protest against the unscrupulous methods of David B. Hill, to whose malign influence must largely be attributed the low estate of the Democratic party in New York to-day. This

year's protest had to do mainly with the general disorganization of the party and, next, with the wreckers who, with Hearst at their head, are striving to run off with the remaining parts of the old Hill machine. It was a notable demonstration that in this State there are still Democrats who decline to be bought or to be swept off their feet by the socialistic craze; who yet hold to fixed and historic Democratic principles. More than that, they have a constructive programme. They realize the widespread demand for reform, for the curbing of the criminal corporations. Whether it is in New Jersey, Wisconsin, or Missouri, the popular discontent calls for a change, and with good reason. Here in New York the alliance between the Republican leaders and the pirates of finance makes it impossible to expect any betterment from a machine nomination. Hence the opportunity is the Democracy's.

Portland, Oregon, has a reform Mayor, whose methods of reform are at least thoroughgoing. Harry Lane, a Democrat, it will be remembered, was elected Mayor last year in a strongly Republican city, after the good government element had tried ineffectively in the Republican primary to secure a high-grade nominee for that party. He spent more than a year investigating conditions. Then, suddenly, he electrified Portland by summarily removing the entire city detective force, with the exception of one man. In explanation, he and his police chief have shown the records of crimes committed in the city for ten months past. It appears from these that less than 10 per cent. of the more serious crimes have resulted in arrests. Hence there was a very convincing case of "neglect of duty," certainly far worse than could be sustained on a basis of police records in New York. It will be interesting to watch, however, whether these rejected sleuths really remain off the force. Their appeal for the present seems to be to the Civil Service Board, and not to the courts. But if the Pacific Coast has developed a method by which policemen can be removed so as to stay removed, Eastern cities will soon be sending thitherward to learn how the thing is done.

One State after another may be delivered over to the standpatters, but there is always some State ready to keep alive the cause of tariff revision by the friends of protection. This honor now belongs to Delaware. The Republicans of that State, finally disposing of the pretensions of Addicks as a party leader,

celebrated their victory by uttering what the Philadelphia *Ledger* calls "the first clear note that has been sounded on the Republican side anywhere." Here is the resolution they adopted last week:

We believe that a revision of the present tariff laws in the near future would be beneficial to the great mass of the American people, and we also favor a reduction of duties on imports from the Philippine Islands.

This is so plain and unequivocal that voters will find it hard to believe that it is a quotation from a party platform at all. There are no mealy-mouthed phrases about injury to "any American industry," but a simple statement of what the Republicans of Delaware want done. The Blue Hen State was the first to ratify the Federal Constitution. If it leads the way to freer trade, it will again deserve the gratitude of the country.

The news from Cuba is increasingly serious, while the mystery of it deepens. Who is behind this revolt? Whence come the funds that supply the revolutionists with arms and munitions? We do not pretend to believe the stories that filibustering expeditions are being fitted out in this country to aid the revolution, but it is undeniable that the very secrecy which surrounds the whole thing is a cause for uneasiness. In previous revolutions the sources of supply have been pretty well known. This one began without the slightest warning in the way of premonitory rumors. Its rapid spread and the refusal of the leaders to accept amnesty or a truce are causing many people to ask what powerful force is behind it all. It is an unfortunate fact that there are certain large business interests in this country which have everything to gain from a long and disastrous revolution, resulting, perhaps, in American intervention and annexation. In their interest alone it would be desirable to have the present mystery cleared up as soon as possible.

"Somebody ought to have known; somebody ought to have told." That is the burden of many comments on bank defalcations like those of the past few weeks. The solemn resolution of the American Institute of Bank Clerks last Thursday, that it is the duty of clerks in financial institutions to expose the irregularities of their superiors, indicates at least that those who are likely to be in a position to suspect such peculations are awakening to their responsibilities. Why any one should have considered applying the schoolboy's abhorrence of "peaching" to the service of a bank clerk is really one of the mysteries. The honest patrolman, as Mr. McAdoo says in his book, will not associate with the grafter, but neither will he tell what he

knows against him. There may have been bank clerks who, on seeing other people's money disappearing in the pockets of the men trusted with it, would exclaim, "No, loyalty and sentiment and the honor of the bank compel me to mind my own business. However, I will not add to the loss by stealing myself." If the Atlantic City resolution is meant for such, it will profit them to read it. Otherwise the criminal law regarding accessories before the fact covers the same point fairly well.

If the packing-house scandals did not decrease the sales of Chicago meat products, where was the packers' grievance all the time? "The Jungle" was published on March 3, 1905. Three months later eleven million more pounds of packing-house products were being sold than in the previous July. The total domestic trade for seven months has been 300,000,000 pounds greater than the corresponding total for the year before the exposures began. It is the foreign and not the domestic trade that has suffered. Nothing could be much more illogical, because everybody with the slightest claim to speak with authority has explained that our export products were far and away superior to those for home consumption. It would be only natural for sales to increase after the new meat-inspection law had guaranteed their quality. Yet the unexpected stimulus to trade, which the packers explain on the ground that the South is selling more cotton and buying more ham and bacon, may have a supplemental explanation in the singular ease and promptness with which the American public gets over a scare and forgets a warning.

The victory of Cambridge over Harvard naturally comes as a disappointment; everything seemed so favorable this year for an American success. Apparently, the crossing of the ocean, the taking in of a substitute, the climatic changes, and the recent great heat were obstacles not easily overcome. But in addition there is the formidable English stroke; we confess that its triumph and that of amateur coaching over professional is the one consolation. The long, easy stroke of the Thames ought to win, for it is the natural one, and is best fitted for the physical training of those who row. Had Harvard succeeded, the professional coach would have been more firmly entrenched at the American Cambridge than ever. Beaten in a fair pull, the Harvard crew have been admirable representatives of the best sportsmanship in America; they faced considerable ill luck without grumbling and took the chances of a difficult and trying course. Their pluck will not fail of its proper recognition. May it be given to at least

some of them to turn the tables next year.

An undercurrent of dissatisfaction with what is known as the universal rule of yacht measurement has been apparent in certain quarters throughout the present season, the main contention being that displacement should not be a factor in the rating of a racing craft. Now comes the announcement that at the approaching meeting of the New York Yacht Club an effort will be made to reopen the whole question of yacht rating. If this be true, the result will be nothing less than a calamity. The rule in question was framed at a meeting of Atlantic seaboard yacht clubs in order to eliminate the racing machine, a craft of excessive overhangs, unfit to sail in tumultuous weather, and fit for nothing but racing. The conferrees desired to produce a full-bodied yacht, the greater displacement of which was to be at a premium, being deducted from the rating obtained from sail area, and sailing line. Such a rule was adopted, and its success may be measured by the record of the Herreshoff schooner *Queen* and the sloop *Effort*, designed by Henry Gielow. Why, in the face of facts presented by these boats, a rating revision should be agitated, is puzzling. Opponents of the universal rule allege that the extra weight of the boats of the new type causes them to bury their noses in a heavy sea, and that they lack accommodations, neither of which allegations is borne out by the facts. A graver criticism is made: the schooners to be produced by Herreshoff and Cary Smith next season, they say, will present vicious extremities of the rule, measuring 87 feet on the water line, and yet rating with *Queen*. It may be stated authoritatively that neither of these yachts will exceed 92 feet water line. The new rule, in brief, offered brilliant promise, which has been partially fulfilled. Let us accord it the thorough test it merits.

Simplified spelling would seem to be by way of slaying its thousands, if one could accept without scrutiny the list of 825 university and college professors who have been pledged since August 1 to lead the simpler orthographical life. But to begin with, these scholars have promised merely to use the new spellings "so far as practicable," and, next, as a whole the signers carry rather little weight on the matter in hand. There are, to be sure, a few professors of literature on the list, and a handful who may be said to represent a kind of literary authority, but by and large the list, so far as published, is made up of teachers of science. These gentlemen are doubtless willing to help a good cause along, and presumably many of them have given their adhesion to simplified spelling much as they would to a petition

for universal virtue. But their correspondence is, after all, not the norm and mirror of good literary form. Any editor who has had experience with academic contributors knows too well that in many cases it makes no difference what grammar, rhetoric, or spelling-book they profess, practically they phrase worse and spell no better than the average college graduate. Their preference does not constitute literary precedent. We begin to fear the simplifiers when we learn that Mark Twain, W. D. Howells, Henry James, T. B. Aldrich, and other writers of that grade are insisting that their works be printed in the new style.

Mark Twain's autobiography, which begins in the current *North American Review*, will be far more interesting than his diaries of Adam and Eve, just because he has, in writing about himself, the kind of realistic background that he always needed for his best work. It is too much to hope that Mr. Clemens, while discussing the *quibusdam aliis* according to his plan, will give away to some oncoming author the secret of his genial humor. But there is a delightful hint at his method in this first instalment. We have known that the works by which he will be remembered are those that spring from the homely soil of the Middle West, and from the life he actually knew. It begins to appear now that his characters, too, were drawn from real people. The inimitable Col. Sellers was a genuine person, a cousin of Mr. Clemens; and those turnips and that bucket of water were a fact. Mr. Clemens himself, as a boy, ate and drank of that repast, while the Colonel presided as if over a royal banquet. And the prophetic millions were no invention of the humorist. Late in life the Colonel dined with Mr. Clemens and Mr. Cable, and the undaunted gentleman began to tell of a little project he had begun in New Mexico through his son:

Under his deft hands it grew, and blossomed, and spread—oh, beyond imagination. At the end of half an hour he finished; finished with the remark, uttered in an adorably languid manner:

"Yes, it is but a trifle, as things go nowadays—a bagatelle—but amusing. It passes the time. The boy thinks great things of it, but he is young, you know, and imaginative; lacks the experience which comes of handling large affairs, and which tempers the fancy and perfects the judgment. I suppose there's a couple of millions in it, possibly three, but not more, I think; still, for a boy, you know, just starting in life, it is not bad. I should not want him to make a fortune—let that come later. It could turn his head, at his time of life, and in many ways be a damage to him."

Then he said something about his having left his pocketbook lying on the table in the main drawing-room at home, and about its being after banking hours, now, and—

If in any way communicable, Mark

Twain's humor may be said to lie in this acquaintance with the homely and kindly incongruities of actual life.

The Kaiser is the greatest general of the great army of professional optimists. "Pessimists I will not endure," he has just said in Breslau, "and let him who is not suited to labor leave and seek, if he will, a better country." He then proceeded to create a large number of optimists by distributing no less than 921 orders and decorations among his loyal Breslauers. This speech has recalled another one made by the Emperor in 1892 when he went even further and informed all "unhappy grumblers" that they had "better shake the dust of Germany from their slippers and withdraw as rapidly as possible from our wretched and miserable conditions. They would then be better off and they would do us a very great favor." Should the Kaiser really banish all who are pessimistic about his government, the next census would show an alarming falling off in the number of his subjects available for military service. There are, for example, the three million Socialist voters, who are distinctly of a pessimistic cast, and support their candidates against the Emperor's express assertion that only traitors to their country would do so. Perhaps the Kaiser has recently seen in the Berlin papers Alexander Moskowski's bitter little story of the man who fell from the moon, and, after travelling all over the world in search of the best country, returned to Germany for permanent residence. When asked why, he replied: "My reasons are quite simple. I have observed in various countries how the State's money is thrown about and what a part protection, corruption, dissipation, folly, and waste have each played in its expenditure. The extreme of each of these faults I found in Germany. So I said to myself, 'A nation which can stand all that without jumping the track must be the best.' Therefore I want to become a German." There is just enough truth in this little tale to have given it a wide circulation in the German press.

The *Frankfurter Zeitung*, in many respects the ablest newspaper in Germany and its leading financial daily, has just celebrated the fiftieth anniversary of its establishment. Originally founded as a commercial journal, it has become the foremost exponent of Liberal political beliefs, toadying to no one in authority and unstinted in its censure of narrow bureaucratic methods of government. Had this paper been founded in Berlin it could hardly have become the power it is. Bismarck would have thrown all his influence against it. But Frankfort, the seat of great culture and wealth, was in the forties and fifties the geographical centre of the German Liberal-

ism which survived the revolution of 1848-49, and therefore, even in 1856, a fruitful field for the new newspaper. It is interesting to note in these days of "business-office" and sensational journalism that, without catering either to the advertisers or to scandal-lovers, the paper has been a decided pecuniary success. Its great establishment is one of the sights of Frankfort, and its circulation outside of that city itself is, we believe, unexcelled in Germany. In respect to its special correspondents the world over, it is truly the London *Times* of Germany. As far back as the sixties it had its own representative in New York, and its discussions of American business affairs have been notably fair and intelligent. The same care and attention have been bestowed on the presentation of financial news from other portions of the earth; not even the Argentine Republic is too far away for its affairs to be covered by occasional well-informed letters. But for the foreign reader the *Frankfurter Zeitung* has one defect—the habit of publishing several distinct editions which are in themselves separate issues. Hence the delivery of the parts goes on all day; after the first "morning paper" there may be six or seven more, only to be followed by several four or six-page evening issues, all totally different.

Since more and more American tourists visit Spain each year, the news that the Alhambra, the Mecca of all pilgrims to that country, is in greater danger of total destruction than ever before will arouse widespread interest in this country. The Government contributes 45,000 pesetas a year for its preservation, but that sum has proved quite inadequate for present urgent needs, and one cannot help wishing, therefore, that some wealthy American art patron might immortalize himself by coming to the rescue. That the Alhambra has survived to this day is in itself a marvel. During its five centuries of existence it has been subjected to severe trials. Shattered, at one time, by an explosion, and shaken by earthquakes, it has at other times sunk so low as to be a habitation of smugglers, and even a stable for French army horses. The present danger lies in the fact that the foundations are being undermined by waters from the old ruined conduits. Not only are the Government appropriations insufficient to meet this condition, but the situation is complicated by a quarrel among the three directors. This has resulted in the resignation, after thirty-five years of service, of the eminent expert in Oriental architecture, Señor Contreras. He has restored many of the tiles, as well as the figures and colors and the other mural decorations, thus giving a fair idea of what the Moorish palace was in the days of its glory.

SHAW CONTRA MUNDUM.

Secretary Shaw, speaking at Winston-Salem, N. C., on Monday, dealt man-fashion with the complaint that American protected goods are sold abroad far cheaper than at home. To be sure they are, he said; why not? The Government, by paying drawbacks on goods for export or by permitting their manufacture in bond from free raw materials, intentionally affords this facility to the American manufacturer:

During the last fiscal year approximately \$10,000,000 worth of invoiced ores for smelting, material for manufacture, and distilled spirits and tobacco were thus used, and the entire product exported and no duty or internal revenue paid thereon. . . . To the extent of this saving in the cost of the finished product, the smelter and manufacturer could reduce his export price and still make the same profit.

There we have the matter in its bald simplicity; and Mr. Shaw proceeds confidently to explain why the manufacturer, already virtually subsidized at home, should be freed in addition from any tax that hampers his trade abroad. It is chiefly because the American manufacturer employs labor, and pays to it, by estimate, about half the amount of his gross business. Take more concretely the case of the American Iron and Steel Company of Lebanon, Pa., which exported spikes and bolts for \$75,000 a year, receiving a drawback of \$10,000 against duty paid on its imported raw material. The nature of the transaction Mr. Shaw describes as follows:

In effect, the Government said to this concern: "If you will consume \$35,000 worth of American labor in the manufacture of \$75,000 worth of spikes and bolts, there will be paid back to you as soon as you export your product \$10,000 of the duty which you pay on the billets consumed." This drawback enabled this concern to sell \$75,000 worth of spikes and bolts abroad for \$65,000, and make the same profit as if sold at home for \$75,000.

This concession is made for the further reason that, unhappily, it is impossible "to protect the American producer of spikes and bolts in the foreign market." The Government cannot do everything, but for a struggling and deserving class it will do what it can.

The dogma implied is clear-cut—for this we thank Mr. Shaw: the American manufacturer must be favored in all markets, because the Government regards him as the trustee for American labor. Evidently, he enjoys a monopoly in this trust. The farmers deserve no consideration in this capacity, although they employ nearly four million and a half laborers; somebody or other, according to the census, employs 2,629,000 "laborers not specified"; but this class of employers is not helped that it may help labor. There are about a million women engaged in domestic service; but

Uncle Sam does not aid the average man's business in the ratio that he pays cook, waitress, and laundress. No; Mr. Shaw makes it as clear as crystal that the manufacturing class, and no other, is Uncle Sam's grand almoner. On this point we should be glad to have Mr. Samuel Gompers's opinion. Supposing the Government to be actively in the work of coddling the working man, could not the American Federation of Labor devise some more direct method than remitting the manufacturer's taxes? It might be worth while also to have the opinion of the Charity Organization Society, on procuring employment for the needy by staking an enterprise that paid about half its gross proceeds in wages. But Mr. Shaw deserves all credit for standing by his guns. From him comes no namby-pamby hint of revising the tariff "when conditions permit"; he makes it perfectly clear that the manufacturer is Uncle Sam's baby, and of right and solely entitled to all the pap a paternal Government can provide. Or better, if any infant industry has grown up, it merely becomes an agent of charity, and as such worthy of all support. By the same token, the literary class should be compelled to keep Mr. Carnegie in funds because he spends an appreciable portion of his income in libraries.

This issue Mr. Shaw faces with official optimism and a personal heroism truly exalted. Fully realizing the infamy of buying too cheap, he perceives the blessedness of paying too dear. Industrial suffering there must be, he admits, but he vows:

I will use my best efforts that it come not nigh my country. If, to accomplish this, it shall be necessary that I pay more for my clothes, more for my shoes, more for my sewing machine, more for my typewriter, more for the barbed wire used on my Iowa farm than is paid for the same articles in Europe, then I will not object. I will consent to pay a little more than otherwise would be necessary to the end that the products of American labor shall be put on foreign markets.

Few of us perhaps are capable of this lofty altruism, and of that few how many are willing to undertake the support of the American manufacturer as a means of favoring about 14 per cent. of our wage-earners? Mr. Shaw, as the Calvin of the protective creed, is free to believe that the Dingley act was foreordained from the beginning of the world; but he moves in an atmosphere of faith too rarefied for the plain American citizen.

"RELIEVING THE MONEY MARKET."

That Secretary Shaw's step for relieving the money market last week was taken when the market was approaching a critical position, no one can deny. The stringency, which brought about a

40 per cent. rate for Stock Exchange day-to-day loans, was not confined to speculative borrowings, but had spread to the market for merchants' discounts; rates for such loans had risen to figures seldom paralleled at this season. On the other hand, the cause of this unsettlement was not mercantile operations, but the exploits of a ring of powerful Wall Street speculators. This combination of capitalists, backed apparently by banks and banking houses under their influence, has deranged the whole structure of Wall Street credits. The sound and logical remedy for that danger would be the forced abandonment of their undertaking by these wealthy speculators, and their expulsion from the market as another and equally notorious stock-jobbing clique was expelled, under very similar conditions, in September, 1902. Secretary Shaw has chosen to ignore this possible way out, and to risk the criticism, which will surely be bestowed upon him, for using the Government's resources to help rich speculators out of an awkward scrape.

We do not say that a Secretary of the Treasury should never take steps to relieve a disastrous strain on legitimate business credits. Every such action must be judged according to the gravity of the emergency and the means employed. The method adopted by the Secretary in this instance is, however, open to objection. Mr. Shaw has ventured to repeat his experiment of last April, when Stock Exchange money rates, under the demands of speculators, went to 30 per cent. and New York bank reserves fell below the legal limit. At that time, as at present, Wall Street had been endeavoring to get gold from Europe, and had not succeeded. The Secretary then announced that the price of exchange "had reached the point where gold ought to have been imported," that "the reason it was not engaged was the loss of its use during transit." He therefore decided that Government money should be lent free of interest, against collateral of the savings bank class, to any bank undertaking to import an equivalent amount in gold. The same plan is the present expedient of the Treasury.

Last April, when this new-fangled scheme was tried, we pointed out the fundamental objections. First and foremost, it was avowedly a bit of meddling, by a Government officer, in a market where he had no business whatever. The Treasury, we admit, has some concern in a stringency caused by lock-up of cash in Government vaults. That it has any right or title to concern itself about the rate of foreign exchange, or about a banker's ability to import gold, cannot for an instant be maintained, except on the theory that the Treasury is a fraternal institution, bound to use its available funds for any one's conveni-

ence. Such a theory, baldly stated, is preposterous, yet we defy the most ingenious defender of Mr. Shaw's experiment to produce any other. If the Treasury had been hoarding money and thereby depriving the market of normal facilities, the obvious recourse would be to restore to the market the money taken from it. Nothing of the sort is done. By the terms of the Secretary's offer, the Treasury will not deposit money with a bank until that bank has engaged for import an equal amount in gold; and the Treasury further requires return of such deposit, the instant the gold arrives. This should make clear the true nature of the transaction.
